An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearings, coars or pulleys.

Power applied direct. Works Ore at Low Cost
More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

WM. GUTENBERGER.

SACRAMENTO, CAL.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF HYDRAULIC GIANTS**, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.

Prices furnished upon application to
JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

IMPROVED HYDRAULIC MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

Bad Policy as Well as Bad Morality.

There is a class of miners in this State who, when seeking to dispose of their claims or to induce parties to go and examine them, are in the habit of greatly exaggerating the amount of work done and the ore developments made thereon. Now, these being facts easily susceptible of verification or disproval, the mine-owner should be careful not to grossly misrepresent them at the outset. He may ask an extravagant price for his property if so it suit him, but this being largely mere matter of opinion, may not serve to greatly damage it in the estimation of the expert, however much the valuation of the latter may differ from that of the owner.

The miner may talk with comparative safety about the big ore assays and the big haulion returns he has been able to obtain, because, here again, the expert cannot readily convict him of error unless there be a glaringly wide departure from the truth. But when it comes to describing the length of a shaft, drift or tunnel, the amount of ore developed or probably stopped out, the thickness, composition and other features of the vein, so far as exposed, and to such other matters as can readily be determined or approximated, it will be seen how important it is that the mine-owner should in his prior statements keep within the bounds of reality. These being much exceeded, the expert arriving on the ground and finding he has been badly deceived, naturally distrusts all else that has been told him, and being so prejudiced against the property at the start is apt to condemn it without making a fair examination of its merits, or perhaps any examination at all.

Any misleading statement made by the miner with a view to selling or procuring an examination to be made of his claim is impolitic and wrong; impolitic because it is almost sure to react to his prejudice, and wrong because it leads parties to expend time and money which they would not have done had only the simple truth been told. Such procedure is, to say the least, a blunder, which in a business point of view is almost as bad as a crime. What is untruthful, is, in fact, very apt to prove unprofitable.

We have had our attention called of late to a number of cases of the kind here complained of. The sufferers in some of these cases have been parties from the East, who, after employing and paying experts to examine mines only to find that the statements made in regard to them were essentially wrong, have concluded to invest their means in other directions. While the practice here commented upon is not exactly a crying evil, it is, nevertheless, one that might as well meet with early correction, seeing it results in considerable inconvenience and loss to some, while it can be of no possible benefit to any. We suggest that the claim seller draw it a little milder at the beginning. A course marked by bad policy as well as bad morality ought not to be continued.

GEOLOGICAL EXPLORATIONS IN BRITISH COLUMBIA.—An exploring expedition has been organized by the Canadian Government, for a geological and topographical survey. The expedition will be conducted by Dr. George M. Dawson and William Ogilvie and will extend its operations along the Stickeen river, along the Pacific Coast to the head of Chilcoot inlet, and survey the Yukon river as far as the 140th meridian.

Richards' Patent Hydraulic Machinery.

NUMBER 5—Concluded.

In the accompanying engravings, Figs. 8 to 10 show the various kinds of valves employed with Mr. Richards' irrigating and draining machinery. These valves are the result of a thorough experience in this kind of fittings and have constructive and other advantages over forms hitherto in use—among other things

tion pipes. It is of the full way type, the bore being closed by an elastic split cylinder that cannot be jammed fast, and which is held close by the water pressure from either side. These valves are of simple and cheap construction and being in all part cylindrical in form, can be made light and still withstand a high pressure.

Fig. 14 represents a sliding joint employed in suction pipes for sinking, pumping sand and so on; and Fig. 15, a service joint, such as is

RICHARDS' IMPROVED VALVES, EJECTOR AND PIPE JOINTS.

free and direct water-ways with ample area and straight course.

The one, Fig. 10, is for heads to 30 feet to be placed above the pump, while the one, Fig. 11, is for heads to 100 feet high. The rectangular form is to give a degree of elasticity and prevent breaking the pumps in case the air vessel should become filled with water and fail to perform its office.

Fig. 12 shows a steam ejector for charging pumps. These are made wholly of brass to prevent corrosion and are constructed with nozzles and throats to eject air instead of water. Three sizes are made, suitable for pumps of various kinds.

Fig. 13 shows a stop valve recently patented by Mr. Richards, intended especially for irriga-

tion pipes. It is of the full way type, the bore being closed by an elastic split cylinder that cannot be jammed fast, and which is held close by the water pressure from either side. These valves are of simple and cheap construction and being in all part cylindrical in form, can be made light and still withstand a high pressure.

Fig. 14 represents a sliding joint employed in suction pipes for sinking, pumping sand and so on; and Fig. 15, a service joint, such as is

used in pumping over the banks of streams, or, in other cases when the position of pipes has to be adjusted, the pumps remaining fixed. In some cases the service joints can be made on the pump, the construction before described permitting this.

Field Work by the Mining Bureau.

Most important field work is shortly to be done under the direction of the State Mineralogist. Among other things, the principal gold lodes or veins in the State are to be carefully examined, and the true condition of the gold in the quartz, pyritic matter, specular iron, talcose slate and other gangues or matrices accurately solved. Particular attention will be given to the investigation of the occurrence of "pay shoots" and "pay pipes" in the different lodes, and the character of the inclosing rocks following the inclination of the pay shoots, and those going down with the pay pipes will be determined both macroscopically and microscopically. By so doing, it is hoped that a simple guide or pointer may be furnished to the miner to direct his operations. Many very different rocks present the same appearance to the naked eye, but when sections are cut from them and placed under the microscope, their true character is plainly to be seen.

The great importance of these investigations cannot be overrated, in proof of which it may be said, that had the Eureka Company understood the pay shoot matter they would have been some millions of dollars richer instead of allowing the Idaho Company to have it.

Arrangements are also being made in the direction of a careful examination of the coal, petroleum, and natural gas supply of California. Mr. W. A. Goodyear, formerly of the State Geological survey, has been employed to make investigations of these latter subjects, and will shortly take the field to gather information for the State Mineralogist's report.

Electric Motors in San Francisco.

The use of electricity for power is gradually coming into favor. For certain purposes it is much better than steam, since the motors themselves occupy little room and are clean and noiseless. There is much to be done with electricity for railroad use before it is as perfect as is desired; but for small motors in cities, there are many things to commend it. The Electric Power and Light Company, of this city, is now engaged in perfecting arrangements for power circuits, by which motors will be furnished for running presses, sewing machines, elevators, etc. Some of this work is already being done, but the system is to be widely extended and perfected.

The San Francisco Tool Company, on Stevenson street, has put up one of Prof. N. S. Keith's dynamos in its establishment, and run it by a small independent single-acting engine. From this dynamo wires can be run to electric motors in the vicinity, and power thus furnished. One of the Keith electric motors, connected with this dynamo, has been put in at the Leak Glove Manufactory on Market street. It is a six-horse power motor and is intended to run 75 sewing machines, in use in the factory. The motor is set at one side of the room and takes up no more space than a couple of joints of stovepipe laid side by side. The motor is noiseless and there is no smoke, smell, steam, grease, dust, or any other annoyance. The company is very much pleased with the new source of power and is willing to show the little machine to any one interested. More of these motors will doubtless be placed in other factories in the neighborhood. It is very simple to put them in, and all that is needed is a wire to the main dynamo.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Dogmatism in Science.

EDITORS PRESS:—In the excellent article from Dr. Stillman's book, "The Horse in Motion," inserted in your issue of April 16th, there occurs a pertinent paragraph relating to scientific subjects. He says: "In all ages there has been a tendency on the part of the masses to follow some leader whom they desired to do their thinking for them; to pin their faith to his, or what they supposed to be his. It is no less so in the scientific circles than in the religious. Dogmatism seems to be leaving the latter and attaching itself to the former." In regard to the latter clause of the paragraph just quoted, Dr. Stillman is, I think, mistaken. There is no evidence of any recent relative change in that respect as between religion and science. In former times scientists have been no less dogmatic than religionists. Copernicus, in deference to the scientific dogmatism of his day, withheld from public enunciation for 30 years his deductions in astronomy which formed the basis of what is now known as the Copernican system; and when his successor Galileo established the correctness of the Copernican principles by incontrovertible demonstrations, the scientists invoked the power of the church to put him down; and for half a century after Newton had discovered and demonstrated the principle of gravitation, the mathematicians persisted in their efforts to discredit it.

Dr. Stillman says: "All science, in whatever department of knowledge, is retarded much by the ignorance and zeal of the multitude who follow on the heels of genius." * * * Itinerant lecturers perambulate the towns as representatives of learning they do not possess, and put forth as proved truth the wildest speculations of enthusiasm and call them science."

Dr. Stillman does the "ignorant multitude and the itinerant town lecturer" a wrong in attributing to them exclusively the evil practice which he specifies. Sir William Thompson is now a noted scientist, much quoted both in this country and England. The London Philosophical Society, figuratively speaking, may be regarded as a scientific assembly around which all other similar bodies revolve in respectfully distant orbits. A few years since this same scientist, assuming that what is known as the Darwinian system of evolution was proven true, in a paper read before that self-same society, advanced the idea that the living germ with which the Darwinian system of evolution necessarily made a beginning had been carried to the earth in a meteoric stone. Such a proposition is not less absurd than the ancient Hindoo idea of the earth resting upon and being sustained by a huge tortoise. Astronomers estimate that meteorites, in numbers by the million, are deposited on the earth annually. Neither Thompson nor his scientific auditors seemed to consider that if one germ had come in that way no plausible reason could be assigned why they should not have come in countless numbers, and of infinitely various species, and thus obviate any necessity for an evolutionary production of species; for every individual organism here on earth at this time has the beginning of its growth in a germ invisible and entirely incomprehensible to the human mind.

JUSTIN CHENOWETH.

French Industrial Prizes.

Among the prizes offered for 1887 by the French *Société d'Encouragement* for discoveries and inventions of value to French industry, the following have been quoted in the Continental press. Prizes of \$200 each: 1. For the utilization of residue in factories. 2. For the discovery of a new alloy for industrial purposes. 3. For the industrial utilization of a cheap and abundant mineral substance. 4. For the useful application of metals which have hitherto been only used to a limited extent for industrial purposes. 5. For the construction of a heating appliance to produce, in small industrial workshops, elevated temperatures by a quick and economical method.

Prizes of \$400 each: 1. For a small motor for workshops, acting for itself or in connection with a larger factory. 2. For suitable improvements in the mechanical spinning of flax. 3. For improvements in the usual form of grain-mills. 4. For a motor for heavy oils. 5. For the economical production of ozone, and its application.

Prizes of \$600 each: 1. For a mode of transmitting natural mechanical forces over long distances when their immediate utilization is impossible. 2. For the manufacture of glasses for chemical purposes. 3. For the manufacture of fine stoneware. 4. For the construction of a simple and solid appliance which will indicate the progress of a train at any distance in a reliable, automatic and regular manner. 5. For the construction of an appliance which will indicate, at a distant point, the temperature of a heated room. It is stated that models, etc., must be sent to the secretary of the society, 4 Rue de Reunes, Paris, by January 1, 1888. Competitors are reminded that the communication of processes to the society does not afford them the protection of a patent, which should be applied for before the competition.

Gold in California.

A Mexican Account of the Early Discoveries.

(Translated for the MINING AND SCIENTIFIC PRESS from *El Minero Mexicano*.)

In 1602 New California was explored for the first time by the Spanish Admiral, Don Sebastian Vizcaino, Viceroy of Mexico and Count of Monterey, who saw specimens of gold. November 3, 1774, King Philip V dispatched a long letter directed to the Count of Fuencalra, Viceroy of Mexico, su circumstantial and austere that it seemed his mind was only occupied with the conversion of the docile natives of California. In 1745 the Padre provincial Cristobal Escobar, sent to his majesty an ample report relative to Sonora and California.

June 9, 1746, Padre Fernando Cousag embarked in the port of San Carlos, situated near parallel 28°, with some Californians and a number of Yaquia, who among those Indians were the best seamen. He wrote a very circumstantial diary, which was published in Vol. 3 of "History of California," printed at Madrid. December 4, 1747, Ferdinand IV dispatched a letter, directed to the Viceroy of Mexico, confiding to him the propagation of Christianity in the Californias. October 30, 1769, Padre Junipero Serra, president of the Missions of California, sighted "la Punta de los Reyes" in latitude 37° 34' north and the Farallones of San Francisco in 37° 35'. November 7, 1769, Padre Serra and Don Gaspar Portola, Governor of the Province, reached the harbor of San Francisco, latitude 37° 46'. On the 11th of the same month and year they returned to San Carlos. In 1770 Padre Junipero having the necessary aid, went without loss of time to the port and Mission of San Diego. While there, the vehement desire of the venerable Padre for conversion increased his anxiety to found two Missions, one of San Francisco and another of Santa Clara, with protection of a Presidio at the port of San Francisco. December 1, 1774, Fernando Rivera Montcada and Fr. Francisco Palou were sent by the Government to examine the harbor. In the same month and year Capt. D. Juan B. Anza returned to Mexico to inform the Viceroy of his expedition by land, having discovered the pass of the river Colorado, and

Opened a Way in Lands Unknown.

Among many nations of heathens, all of whom manifested themselves as friends. Early in 1775 Lieut.-Col. Anza left Mexico for a second expedition. July 6, 1775, the San Carlos, in command of Lieut. D. Juan B. Ayala, of the navy, arrived at San Francisco, where Don Jose Castanayares made a particular examination of the harbor. He found the channel wide enough and entered by night without trouble. The pass is less than a league in length and more than a quarter in width, the entrance without any bar, and with strong currents, entering and going out according to the flood or ebb-tide of the sea. Within, they found a land-encircled sea having two arms, one of which penetrates to the southeast about 15 leagues, the other to the north about 5 leagues. Further in they came upon a great round bay ten leagues in diameter, into which discharged itself the river of San Francisco, half a league wide, formed of five rivers. All that immensity of water discharges itself through said pass to the Pacific and into the Gulf of the Farallones.

September 22, 1775, Fr. Francisco Palou and Miguel de la Campa Cos reached San Francisco and found letters from Fr. Vicente Santa Maria, which gave notice that San Francisco had been satisfactorily examined by the packet-boat San Carlos. At the end of March, 1776, Don Juan B. Anza, accompanied by Fr. Pedro Font, missionary preacher of Queretaro, made a new inspection of the port and selected sites for the Presidio and the two Missions. June 27, 1776, Lieut. Don Jose Moraga went to San Francisco by land with the missionaries Palou and Fr. Pedro Camhoy, taking laborers to found the Presidio. August 18, 1776, those missionaries arrived at San Francisco, on the packet-boat San Carlos in charge of Lieut. Francisco Rivera, and in September, 1776, the Presidio of the port was completed. Its foundation dates from that period.

October 9th, of same year, the Mission of San Francisco was established on a site selected near the Presidio, and Jan. 6, 1777, the Mission of Santa Clara was founded. By these means the civilization of the aborigines was begun in this distant land. In the synoptic statistical picture of the rich mineral exhibited by Heron de Villeforse, with reference to the years anterior to 1807, we may see figuring the gold of the Californias. For 45 years

The Spanish Government Maintained Dominion

Of New California, and by its impotence failed to make any profit of the wealth of the territory, notwithstanding its eagerness for the conquest of that region, as much separated from the City of Mexico as from Madrid.

In 1845 Senor Castillo, of New California, visited the cabinet of mineralogy of the School of Mines of Mexico, carrying with him specimens of native gold, of mineralized silver, of native lead, of cinnabar, and of mineral carbon; but not even these evidences of the riches of California induced the Government to pro-

tect their exploitation. A Mexican newspaper assigned the discovery of gold in California to the year 1846, attributing it to a foreign hunter who came from Russian America, incited himself with the Indians of the tribe Salsona, and remaining among them, succeeded in becoming chief of the tribe, whereby he ascertained the existence of

Their Placers of Gold;

So that when the North Americans in warlike manner invaded Mexico, they already had as incentive the gold of California, and this was the motive to attempt its annexation. In 1847 they seized by force of arms this rich country of our Republic, and on January 19, 1848, accidentally made the first discovery of the riches in gold which the waters of the Sacramento were concealing.

Captain Sutter, commander of the fort which bears his name, established on said river a sawmill, by contract with one Marshall. He built a dam, dug a channel for the movement of the water-wheel, set up the machinery and commenced sawing. One day, Marshall noticed, at the bottom of the sluice, sand mixed with gold, which was perceptible to the simple sight. This he communicated to Sutter, and they not being reserved, the news was divulged as if by enchantment. The marvelous results obtained at the beginning attracted in a few weeks hundreds of men, and before three months, to those arid places more than 40,000 men rushed, in search of the coveted metal.

[It may be well to supplement the above account by certain documentary evidence which has probably been overlooked by the writer in *El Minero Mexicano*, and which verifies his statements. It consists of extracts from documents published in Mexico in 1845, by Manuel Castanayares, Representative in Congress from the Department of Upper and Lower California, relating to the existence of gold in that Department. They show that gold had been found here in 1843. The translations were made in 1867 by Chas. G. Yale, now one of the editors of the PRESS, and were first published in a book by his father, Gregory Yale, on "Mining Claims and Water Rights in California." The extracts referred to are as follows.—EDS. PRESS.]

"The gold placers discovered in the course of last year have attracted the greatest attention, for they extend nearly 30 leagues. The good quality of this metal is made manifest by the certificate of its assay, which was made at the mint of this capital, and by the sample which I send to your Excellency. In order to develop the great elements of wealth in which California abounds, measures ought to be taken only after mature deliberation. I, therefore, shall have the honor, within a few days, of presenting to your Excellency a memorandum detailing these elements and the means of developing them with very little sacrifice. Mexico, March 2, 1844."

"The mining interest in California is of great importance, and I have the satisfaction of assuring you that it forms one of the most valuable resources of that department. Besides the silver mines which are found there, and various other mines which have actually yielded metals, the gold placer, especially, is worthy of great attention, which, extending nearly 30 leagues, was discovered lately, together with mines of mineral coal. It is painful for me to have to confess that mining is in a worse state than agriculture; the latter is in its infancy; the former it can be said is not yet born, notwithstanding that, according to the nearest estimate of reliable persons in Los Angeles, on my departure from that town in December, 1843, there were in circulation about 2000 ounces of gold which had been extracted from the above-mentioned placer, the greater part of it destined to go to the United States. This metal contains, according to the certificate of its assay by the mint of this capital which I sent to the Government at the beginning of this year, twenty-two carats, two and a half grains of gold, and fifteen grains of silver. September 1, 1844."

(To be Continued.)

THE *Kern County Californian*, speaking of the quarries belonging to the Tehachapi Stone Co., says: The brown and yellow sandstone is pronounced equal to the fine brownstone so much in use in the large cities of the East, and the company has a green sandstone that is the same class of greenstone that is all the style for artistic buildings now in Chicago and New York City. The quarries are easy of access, being only about two miles from Tehachapi Summit, on the line of the Southern Pacific railroad. The stone can be shipped readily to market and will supply building stone fully as cheap as it costs in eastern cities.

BENEFIT OF COMPULSORY VACCINATION.—The operation of compulsory vaccination was suspended at Zurich, Switzerland, in obedience to popular clamor, in 1883. The deaths from smallpox per 1000 total deaths for the two previous years and that year had been, in 1881, 7; in 1882, 0; in 1883, 8. They rose, after compulsion had ceased to be used, in 1884, to 11.15; in 1885, to 52; and in the first eight months of 1886, to 85 per 1000.

TUNNELING UNDER THE DANISH SOUND.—The proposed tunnel to connect Denmark with Sweden, it is said, is being actively promoted by French capitalists.

A Region of Subterranean Fires.

The Burning Levels of the Old Bunanza Mines.

Under the guidance of Superintendent Patton, a Virginia *Enterprise* reporter visited the underground regions of the Consolidated California and Virginia mine. The object of the visit was to inspect the apparatus by means of which it is expected to fill the old burning sections with carbonic acid gas, and thus extinguish the fire that for so many years has been smoldering there. An account of the underground trip is as follows:

We descended the C. and C. shaft at 1 o'clock in the afternoon, and remained underground until 3 o'clock. While below we visited the main shaft of the Ophir mine, the old Consolidated Virginia shaft, and all points in any way connected with the region of smoldering fires and the resulting gas.

From the 1500 station of the C. and C. shaft we took our way through the connecting drifts directly to the Ophir shaft. We found the air everywhere pure and fresh, with a draft in some of the drifts that almost amounted to a gale. The air in these places was decidedly cold, and we found the blanket coats we wore very comfortable. We mention this for the reason that there has been much talk of gas underground interfering with the operations of the miners engaged in the ore-producing sections. We everywhere met miners pushing cars of ore and rock along the drifts, and all were working in perfect comfort. The gas is all behind the bulkheads that inclose that portion of the mine in which the fire smolders among the old timbers. A man may stand with his hand upon one of the bulkheads and not be able to detect the slightest scent of gas.

The Furnace

For the manufacture of carbonic acid gas is situated on the 1700 level of the Ophir mine. It is in the station at that level, and is on the east side of the main shaft, from which it is but 30 or 40 feet distant. The shell of the furnace is of boiler iron; in fact, it was originally a large tank (in the shape of an ordinary steam boiler), which was used as a reservoir for compressed air. One end of this tank was cut out to make a door for charging it with coke and charcoal. The tank or furnace, as we may now call it, occupies a horizontal position. Firebricks have been placed in it on which to burn the fuel, and it is lined with brick in order to protect the iron shell against the great heat.

At the end of the furnace, opposite that at which the coke is introduced, is a heavy wrought-iron pipe, 12 inches in diameter. It is through this pipe that the carbonic acid gas, formed in the furnace through the combustion of coke, passes and is carried through a bulkhead into the inclosed space wherein is the fire that is to be extinguished.

The draft through the furnace is very strong, and when the fire-doors are open the flames within roar like a blast furnace. The whole interior glows with an intense white heat. Cast iron or any other ordinary metal would be melted in a moment by the great heat. Indeed, the lining, which is of common brick, is fast melting out of the shell, and it will be necessary to reline it with fire-brick.

In the furnace is burned a mixture of coke and charcoal. It consumes about one ton (of 2000 pounds) a day, producing 40,000 cubic feet of carbonic acid gas, which gas goes directly into the big pipe that leads from the furnace to and through the bulkhead.

The Course of the Gas.

We shall now follow the gas produced in the furnace till it has been carried into the burning section. Where the pipe (12 inches in diameter) leaves the furnace for the first two or three feet of its length, it is almost at a white heat. It is then carried downward and enters a large trough or flume that is full of cold water. This water is brought from the main shaft near by, and a constant stream of 8 or 10 inches passes through the box or flume. This water cools the gas that is flowing through the pipe. The pipe for a distance of 80 feet lies in this trough or flume, and is wholly covered with flowing water. Then the pipe enters the main incline, still lying in its trough, and goes down 70 feet in this way to the 1750 level. The water dashes down through this trough, and over and around the pipe, with the noise of a small Niagara.

At the Bulkhead.

Here (on the 1750 level) the large pipe enters one of the bulkheads that serves to wall-in the regions of fire. The pipe is found to be quite cool, but little warmer than the surrounding air. The bulkhead through which the pipe passes is 24 feet in thickness. All about the pipe is closely walled up, and on the outside it (the pipe) has a puddling of clay, which is constantly kept wet. We sat at this point, listening to explanations given by Mr. Patton, and not a smell of gas of any kind was observable.

A Tremendous Draft.

A tremendous draft inside of the bulkhead sucks in the carbonic acid gas brought there through the pipe. When the bulkhead was cut through for the purpose of inserting the end of the pipe, all were astonished at the draft that was disclosed. It was so great that the workmen were obliged to be on their guard against

being sucked in and carried into the region of interior fire. This may appear to be an exaggeration, but an anemometer placed in the current of air showed it to have a velocity of 500 miles an hour. On the surface of the earth 50 miles an hour is thought to be a fearful gale, but here is a gale of 500 miles. This brings into one's mind at once thoughts of the tremendous gaseous disturbances to which the surface of the sun is subject.

Of course this draft was not long left open, the influx of atmospheric air, combining with the carbonic oxide gas within, being liable to form an explosive compound. The pipe was in readiness, with its lower end closed, and it was at once thrust through the opening and the work of filling in around it begun. As the carbonic acid gas fills up the mine this great draft will doubtless slacken. It may even cease when the inclosed space is filled to a level with the end of the pipe. In case it shall do so, a blower will be placed in the pipe between the furnace and the bulkhead and the carbonic acid gas will be forced in.

The Amount of Gas that will be Required is roughly estimated at 1,500,000 or 2,000,000 cubic feet. As the gas passes in behind the bulkhead, it settles down into the lowest part of the inclosed space, being heavier than the carbonic oxide gas within, and also heavier than atmospheric air. It will go down to the 1900 level. There it will be stopped off and prevented from sinking farther by water. Thus all the inclosed space in which are the smoldering timbers will be filled up with carbonic acid gas, which will displace the carbonic oxide gas just as water poured into a bottle displaces the air.

When all the burning section has been thus filled up, the fact will be known by carbonic acid gas flowing out through the pipe on the 1500 level, through which the gas from the fire is now escaping into the old Consolidated Virginia shaft.

A tolerably close estimate of the amount of coke it will take and the time required to fill the burning section with the carbonic acid gas can be made. One pound of coke produces 20 cubic feet of gas; 2000 pounds of coke a day is consumed in the furnace, sending into the space to be filled 40,000 cubic feet of gas. Thus 50 tons of coke will make 2,000,000 cubic feet of carbonic acid gas, which will fill the burning section, and the time occupied with one furnace (burning one ton of coke a day) will be 50 days. But a second furnace may be put in and the operation shortened to 25 days.

A Second Pipe Now In.

A second pipe, a small one, its diameter being but four inches, was yesterday about in place, which will take gas from the furnace now in use to supply the 12-inch pipe. This pipe runs up to the 1600 level, where it passes through a bulkhead 24 feet thick, faced with two feet of solid masonry. This will pour in the choking carbonic acid gas the same as the large pipe is doing. The operation will, no doubt, prove a complete success, unless there may be in places caves that have closed up and isolated some chambers in which there is smoldering fire. This would prevent the gas now being injected reaching such places. This, however, is a thing to be ascertained after the fire has been extinguished in the sections now attacked. If such isolated chambers shall be found, they will be drowned out with the gas, the same as at present being done in the section of the mine that is being operated upon.

There are some places over the inclosed section (in its roof) from which the carbonic oxide gas now escapes through fissures in the rock, but this will not at all interfere with what is now being done, for it makes no difference whether this gas from the smoldering fire goes out through these fissures as the carbonic acid gas rises, or goes out by way of the Consolidated Virginia shaft.

The Artificial Outlet.

The main outlet for the gas from the burning section is through an 11-inch pipe on the 1500 level, near the Consolidated Virginia shaft. This pipe passes through a bulkhead and thence goes into the bottom of the north compartment of the shaft. There is a great draft through this pipe, the shaft being a strong up-cast. Though the end of the pipe is open to sight where it passes under the bottom of the shaft compartment, one may stand within five feet of it and smell no gas. At the same time the gas is so strong and deadly that a lighted candle held in it is extinguished as quickly as though it had been thrust into a bucket of water. There is no danger in thus thrusting a flame into carbonic oxide gas of this strength, but were there mingled with it a certain considerable per cent of atmospheric air, it would become fire-damp and would explode with terrific force. Indeed, at the time the bulkheads were being put in, several very violent explosions occurred on account of the admission of too much atmospheric air.

Men were at work all about this escape pipe and, indeed, were constantly passing to and fro through drifts where the carbonic acid gas was coming up through fissures in the rock, without the slightest fear or inconvenience. Where the gas comes up at the fissures it is overcome by a superabundance of atmospheric air; it is weakened beyond the exploding point, for there is a draft of pure air rushing through that amounts to a gale—an underground hurricane. Yet,

hold a candle to one of the rock fissures and the light, burning wick and all, is extinguished instantly. Here is the only place in the mine where one gets a smell of the gas, and it is by no means as strong as it is at times found (when the atmosphere is in the right condition) on the surface, near the old Consolidated Virginia shaft.

In Conclusion,

It may be stated that after the inclosed section shall have been filled to overflowing with the carbonic acid gas, it will be allowed to remain a month or two before any of the bulkheads are opened. The opening will be very cautiously done, and only after carbonic acid gas has taken the place of the carbonic oxide gas at the escape pipe. This may be known by several tests. A very simple one is to introduce the gas into lime-water, when a precipitate will at once be formed of the contained lime.

The rock in the mine will retain heat a long time, but this may be overcome by the use of water thrown on through a hose, once the fire is out and the gas gone.

The glowing furnace at the 1700 level of the Ophir, where the gas is made, presents a novel and striking scene—a scene almost startling to an old Comstocker coming suddenly upon it from a dimly lighted drift. It sends a red glare all about the station, such as one sees in a big foundry where small rivers of molten iron are flowing about. The men, too, look in the red glare like beings belonging a little lower down in the subterranean regions where old Satan is firing up. It was yesterday compared with the furnaces in the hold of a big ocean steamer, but here the fire is much fiercer. The coke and charcoal, under the strong—fearfully strong—draft, bring all inside the furnace to a white heat. The heat and glare are so intense that one feels all the time as though there were danger of something giving way or blowing up.

WAVE SCULPTURE AT SANTA CRUZ AND SANTA MONICA.

Then besides the roar of the furnace, there is the roar of the falling water in the incline, the rattle of cages and the clank of machinery. All these sights and sounds taken together constitute a small pandemonium, which it is worth while to experience, as it jolts one out of the every-day, jog-trot scenes and sensations of life.

A QUARTZ MILL IN BOISE CITY.—Mr. O. Jacobs intends to build a five-stamp quartz-mill in this city and attach it to the water-power which runs his grist-mill. The stamps, battery, etc., are in a mill which he owns in Red Warrior district, near Rocky Bar, Alturas county, Idaho, and have not been in use for several years, but are well preserved and as good as new. As soon as teams get in to Rocky Bar he will send for the battery and put it up here. This will afford an opportunity for prospectors and quartz miners in the vicinity, and there are several, and will be many more working quartz mines in the hills north of town as soon as they have an opportunity to reduce the ore or work it near home. There is no doubt but a mill of this kind will pay the owner and be a benefit to the city—something that has long been needed.—*Boise Statesman*.

BUY TAILINGS.—The *Lyon County Times* says: It is our private opinion, publicly expressed, that a person with money to invest might get a great deal better buy tailings with it than stock. It will not be a great while before all the low as well as high grade tailings in this State will be worth considerable money, from the fact that a process has now been found by which they can be worked, and nearly all the bullion in them secured. But a short time will elapse before Dr. Rae's electrical process will be in use in all the mills in the State. There is yet an immense quantity of tailings scattered around in large and small lots in the State, and it appears to me that a man with capital could make many much more investments.

THE Bisbee steam wagon takes the loaded wagons from Bradshaw's station to the town, a distance of nine miles. It makes a round trip daily, and hauls five of Carr's large freight wagons easily. The wagon is fast gaining favor in the eye of the mine-owners of Bisbee.—*Tombstone Epitaph*.

California Coast Scenery.

On leaving San Francisco bay, through the famous Golden Gate, a fine view is presented of that historic portal. One can obtain, from the ocean point of view, a much better idea of the harbor entrance than from the hills on either side. The steamer passes close outside of the Seal rocks, and in its southern course soon passes Point Montara, where there is a fog signal. Four miles below is Pillar Point, behind which is Amersport Landing or Half Moon bay.

Pigeon Point, the next noticeable landmark, has a lighthouse of the first order and a fog signal. The country in the vicinity of this point is a fine potato-raising section, and there are some sawmills near there also. New Years Point (or Ano Nuevo) is 18 miles above Santa Cruz, and is another fog-signal station. Another lighthouse is met at the point at Santa Cruz. Here opens the wide expanse of Monterey bay, around the edge of which are many settlements of more or less note. At the northern extremity is Santa Cruz, and at the southern, Monterey, where so many tourists gather every year.

After crossing Monterey bay and passing Point Pinos, the small bay of Carmel is passed, a place where formerly the whalers had a rendezvous. Between that and San Simeon is Point Sur, a high, round-topped point connected to the mainland by a low neck. Then comes Piedras Blancas (white rocks), where there is a lighthouse marking the northwest point of San Simeon bay. Near San Simeon is a whaling station, and just below is the town of Cambria, where small vessels land for dairy

Learning to be a Mechanic.

Much apprehension exists, not only among young men but also among older and experienced ones, about the means of acquiring the mental and physical skill necessary to become a good mechanic. A cotemporary, in speaking upon this subject, says that proper attention to dictums, and a certain amount of memorizing of rules, is well enough; but the learning to become a mechanic is education, training, discipline. Mere accumulation is not education. Books for the young mechanic are of great service, but oral instructions with examples are of greater value. Books are guideboards pointing the road; living instructions are vehicles that take you on your road.

But, after all these, there is the necessity of personal endeavor. If the phrase "self-taught" ever has a meaning, it is when applied to a good mechanic. The learner must be a practitioner. All the books and all the oral instruction in the world will not produce a good filer or make the apprentice a good chipper nor teach him to properly handle a lathe. These instructions must be supplemented by a long, patient practice, by repeated trials, with accompanying failures.

From the school and the playground the apprentice enters the shop, where one of his first surprises is to ascertain that he has muscles that are unused, or, at least, are not under control. Drawing a file straight is a test of the power of will over muscle; so is the striking the head of a cold chisel with a hammer while the eye is on the chisel point; so is the sudden, instantaneous shifting of the lathe belt in screw cutting—in short, the shop is a wonder-hall where much is new and strange.

No study of books, and no verbal instruction alone, will reconcile these new things to the acquired habits of body. But these, combined with unwearying, painstaking practice, will do it. Let the neophyte settle, once for all, in his mind, that no more dependence can be properly laid upon outside aid, whether of books or men, than of pointing the way and showing the "how." Let him settle solidly to the belief that he is to make his own way in the shop, as afterward in the world, and act accordingly. The way will then gradually clear before him. But let him beware of the conceit that he is independent of books and men—they are only helps, but they are necessary helps. With a fair knowledge of arithmetic, and a habit of observation coupled with a desire to know "the reason why," the mechanics' apprentice is pretty well fitted to enter the shop.

Another writer upon the same subject gives the following important hints as to

How to Learn:

What a mechanic most needs to-day is to know how to think. A man who can do this is never at fault for ways or means; he can meet any emergency. If a difficult job comes along, he rises to it and enjoys conquering the difficulty. He is an inventor. He invents hundreds of things every month of his life.

Such a man loves dearly to go on a tramp. He loves to go into every shop and factory and use his eyes. That man is a scholar; is at school all the time; has learned the one vital lesson and knowledge is his. Our man has learned how to learn. Not a shop does he enter but something appears which he wishes to see. He learns a new kind while he is watching Boh light his pipe or set a lathe tool. He finds a treasure where Mike would see nothing but steel, scrap iron and \$2 a day.

Perhaps our man has got half an idea as to some improvement to a machine. He is working up his odd minutes in perfecting his invention. As he walks through a shop he sees a jig for some peculiar job. It is nothing but a couple of screws and two pieces of iron, yet it suggests something, and his invention is perfected. Like a flash the mind catches the idea of what is wanted, yet the article which suggested it is no more like it than "elbow grease" is like "taper oil."

When you learn a trade or study a lesson, then learn how to catch new ideas. Learn this thing, and if you can do it the trade is yours.

A FINE MARBLE QUARRY OPENED.—Recent developments in the Slover mountain marble quarries, near Colton, San Bernardino county, demonstrate the fact that that mountain is not only composed of some of the finest building material to be found on this coast, but that there are ledges of fine statuary marble that, according to statements of Italian sculptors to whom samples have been sent, is equal and even superior to the finest Italian marble. L. L. Dyer, of Troy, New York—a gentleman who has spent his entire life in fine marble work—is the superintendent of the Colton Marble Company, and is rapidly developing the quarries. Seventy-five men are now in the employ of the company, and this number will be increased to several hundred as soon as the machinery is put in working order for cutting the marble.

THE coal shipments from Seattle during the month of March amounted to 22,218 tons; from Tacoma, 22,171 tons; from Nanaimo, 18,595 tons; and from Departure bay, 11,450 tons. The shipments from Puget sound thus exceed those from British Columbia nearly 15,000 tons.

THE Atchison, Topeka & Santa Fe railroad proposes to develop the coal fields of Northern Mexico.

THE Toiyabes will be extensively prospected this summer. Big discoveries are among the possibilities, as this range is one of the best mineralized in the State and rich in the ores of nearly every known metal. There is not a better field anywhere for a prospector to operate in.—*Belmont Courier*.

Passing Events.

Placer mining strikes are reported both in Arizona and Mexico this week, and have caused some local excitement at Phoenix and Nogales. No details have so far been furnished.

The building of water-power mills on the Comstock, soon to be commenced, is a move of great importance for that section. Everything that will tend to more economy in quartz crushing will help the Comstock mines, where they have such an abundance of low-grade ore.

Railroad building in this State is going on in many directions and new regions are being opened in many counties. It will only be a short time before we shall have direct railroad communication with Oregon. To the South, however, is where most of the work is now being done.

A good many miners seem to be going north this summer, to Alaska, Idaho and Montana. The mining season is about open in all those regions.

MECHANICS' INSTITUTE EXHIBITION.—The Board of Trustees of the Mechanics' Institute announce that the Twenty-second Industrial Exposition of the society will open on Thursday, Sept. 1, 1887, and will close on Saturday evening, Oct. 8, 1887.

On the east side of Panamint valley, Inyo county, is a very large ledge of antimony ore. The metal was quoted recently in London at \$150 per ton. No effort has ever been made to do anything with this ledge.

Prospecting in California.

The season for prospectors' work in the field having now commenced, we may expect from this on to hear of mining discoveries in many directions. While, of course, most of the region near by the more prominent mining camps has been pretty well searched over, there is still a large area of this State where the prospector has a chance to explore. And, moreover, some camps which have been comparatively little worked, but have been known for years, are showing up good properties. Hildreth, in Fresno county, is one of these now coming to the front. The Julian and Banner mines, in San Diego county, are others. The old Holcomb Valley mines, in Southern California, are once more attracting attention. Even in this central and well-known Nevada county mining towns, there is a greater era of quartz development than ever before. Then the Piru mines, in Ventura county, the Cargo Muchacho, in San Diego county, and others thereabout are attracting attention.

There is no reason at all why quite a large range of country to the south, as well as to the north, should not, in time, show up many mines. As the country becomes settled up more than it has, more careful search will be made. Men will not try to cover too wide a range in their prospecting and will confine their operations to more limited fields. This will result in more careful search, as a matter of course. And now that the conditions of quartz mining in California are so much better than they were 10 years ago, there is more encouragement for prospectors and miners. Small mines are now worked profitably, which, when loaded down by companies and officials, were failures. We are learning every day how to work our quartz properties more economically.

New Placer Discoveries.

Boring of artesian wells and searching for water is going on all over this coast. There are so many regions where water is scarce that every effort has to be made to get it. Tunnels are run into hills, springs are opened, wells are bored and dug, canyons and gullies are searched, all to find water. In doing this kind of work it is but natural, in a mining country, that minerals will sometimes be found, as has been the case in several instances. The latest one of the kind is at Phoenix, Arizona, where there is quite an excitement from the striking of rich placer gold at a depth of 41 feet in an artesian well now being sunk in the Courthouse plaza. This sand-pump brought up fine gravel and black sand, which a miner named S. L. Sanders prospected, and out of a single handful of gravel took a dozen colors of coarse, bright gold. This bedrock has not been reached, which makes the discovery more important, as the gold stratum may be several feet deep. The whole of Salt River valley is said to be underlain with such gravel and sand.

A dispatch states that there is also much excitement at Nogales, Arizona, among mining men, over the discovery by some American prospectors of immensely rich placer mines near the town of Bacnacha, in Sonora, 50 miles southeast of Nogales. It is thought that these are the rich diggings worked by the Jesuit priests 200 years ago. There is a general rush from Nogales.

California Railroads.

A great deal of the material progress of California of late years is due to the creation and extension of the railroad systems of the State. For a time a few years back there was a cessation of railroad building, but for months past gangs of men are at work all over the coast engaged in railroad construction. In California the roads are being extended, and new tracts are feeling the influence of the presence of the locomotive. Rapid settlement of the country is the result, and on all sides are seen the evidences of progress and development. Of course, in carrying out this railroad work immense sums of money are expended for labor and material, which goes into business channels. It is a source of congratulation that this work of construction is again so active, since it augurs well not only for present confidence but future prosperity. There are still several parts of the State where little has been done in railroad building, and these parts are not nearly so prosperous, nor advancing so

rapidly, as where the trains are running. The railroad men will not, however, stop with their present plans, but will doubtless look after the interests of other sections in due time.

The following statement of the railroad systems of California shows in brief the miles of road in operation up to the end of last year:

Total miles broad gauge railroad in California.....	2425.07

COL. GEO. E. WARING, the widely-known sanitary engineer, is on a visit to this city. He is on the coast for the purpose of designing a sewerage system for the city of San Diego.	
---	--

Reclaiming Land in California.

The Engines and Pumping Machinery Employed.

Up to a recent date the reclamation of swamp lands in California has been more or less of a failure; most of the early efforts in this direction were undertaken with a very slight knowledge of what was required, and the machinery used was inadequate. In fact the appliances were crude and the systems not of a character to insure success. The greatest difficulty met with was one that was not sufficiently recognized at first, and that was the seepage of water that comes through the best levees that can be constructed with the material at hand in the locations where the levees have to be built.

As a consequence, at various times, when crops inside these levees promised large yields, they were entirely destroyed by seepage water caused by high water outside the levee during the spring freshets. There is little difficulty in making the levees high and strong enough to withstand any pressure which is likely to ensue from freshets. This being accomplished, the only thing remaining to perfect a reclamation scheme is to take care of what water may seep through the levee and the rain-water that falls within the reclaimed area in the winter season. At that time, of course, the evaporation is hardly noticeable, and this water must be taken care of by other means.

Before attempting to explain the methods which have been adopted to take care of the seepage-water in various districts, it might be well to enumerate a few of the advantages which reclaimed lands have over the irrigated lands of the State. 1st. The lands are superior in quality. 2d. The land will, in many cases, yield from two to three crops a year. 3d. It is in all cases, at present, arranged so that it can be irrigated if necessary, as the land lies below the surface of the outside water; therefore, by means of iron pipes with gates, it can be irrigated at will. On the other hand, when lifting the surplus water from the land, it can be kept at the most suitable distances from the surface of the land, thus insuring a full crop every year. As to the cost of reclaiming land, it of course depends on the conditions, of amount of area, length of levee, etc. The cost is from \$20 to \$50 per acre, according to size of district and character of levee.

The cost of this land before reclaiming, in most instances, is \$4 per acre or thereabouts, and after being reclaimed, sells readily at from \$100 to \$1000 per acre. In instances where the land has been properly reclaimed and set out in orchards, prices as high as \$1000 per acre have been offered.

The lands which have been reclaimed are mainly in Sacramento, San Joaquin and Colusa counties and near Stockton. It has been found from experience that it is not practicable to reclaim lands west of Collinsville, as is shown by the failure in reclaiming Sherman island, the failure being caused by the hardship being so far from the surface that it was found to be utterly impossible to build a levee that would not sink. The condition of the islands further to the eastward, along the banks of the Sacramento and San Joaquin rivers, is different entirely from the Sherman, as we shall show further on in this article.

More recently, the conditions of the whole matter have been very much better understood, so that the difficulties which were met with in the earlier history of reclamation in this State have been obviated.

In 1881, the San Francisco Tool Company began to turn its attention to perfecting reclamation machinery and has since then paid special attention to the subject, and erected many successful plants. As a history of this company's work in this direction is, in a measure, a history of recent land reclamation in California, it will be well to follow it.

The first plant they erected (in 1881) was on Rough-and-Ready island, on the San Joaquin river. There they placed a 10-inch centrifugal pump. At the time this pump was put in there had been a break in the levee, and the island had been completely inundated. The island was pumped out at a cost of \$1.50 per acre, and the whole finally reclaimed, making the land worth, after reclamation, from \$150 to \$400 per acre, while, without the pump, it could not have been successfully cultivated. It may be added here that this pumping was done with a 20-horse power thrashing engine, which, during the sum-

mer, was utilized for harvesting purposes. It was found by experience that it was too expensive to continue pumping with the thrashing engine, and eventually a 15-inch pump was put in, with suitable horizontal boiler and a single-acting engine of the San Francisco Tool Company. Some of this land has recently been sold for \$400 per acre.

The Pearson Reclamation District, near Courtland, Sacramento county, is a notable instance of the value and success of the appliances adopted. In the first place, the Tool Company put in a 10-inch pump, which was afterward replaced by a 12-inch one. Then a 15-inch pump was added. In their contract with the San Francisco Savings Union, they guaranteed the 15-inch Gwynne pump, together with the 12-inch turbine, to raise at least 10,000 gallons of water with an indicated 40-horse power against a head of 10 feet. The results of accurate measurements, made by a thoroughly competent engineer, showed that with only 88 revolutions of the engine, or 264 revolutions of the 15-inch pump, and 234 revolutions of the 12-inch pump, they were able to raise 16,000 gallons per minute, with an indicated horse-power of about 50 against a head ranging from 9 to 14 feet. The average daily consumption of coal was 3750 pounds of South Prairie screenings for a run of 24 hours. After awhile the 12-inch pump was replaced by another 15-inch one, and there then was added a 30-inch siphon centrifugal pump. Then later on there was added to this another 30-inch pump, making two 30-inch pumps and two 15-inch pumps, having a capacity of 100,000 gallons per minute, which is equal to a stream 33 feet wide, 7 feet deep, and running 50 feet per minute.

This siphon centrifugal pump is now adopted in all large reclamation districts in Europe to the almost entire exclusion of other systems. Its main features are: The siphon action preventing the pump from at any time raising the water higher than the exact difference between the two water levels; the connecting of the runner of the pump in a direct manner to the main shaft of the engine on a level above any possible flood-water; the discharge pipe conducted over the levee down to a point below the lowest possible low-water mark of the outside stream. No foot or discharge valves of any kind are used, thus avoiding all friction inevitably caused by valves. The pump is charged by means of the vacuum created by the condenser. When the pump is stopped, a water-gate placed at the discharge of the pump, prevents the outside water from siphoning over the levee into the district; the pump in the meanwhile remains charged or primed. Large hand-plates in the aide facilitate the examination and cleaning of the runner. The pump is connected directly to a compound condensing engine with variable expansion gear. The diameter of the high and low pressure cylinders, 14 inches and 26 inches respectively. The stroke is 18 inches; the number of revolutions is from 130 to 210 per minute, according to the height the water is to be raised or the quantity desired to be discharged under any given circumstances—which can be increased from a minimum of say 10,000 gallons per minute to a maximum of 60,000 gallons per minute. The diameter of the discharge pipe was increased from 30 inches to 40 inches immediately after leaving the pump, and that of the suction pipes from 23 inches to 28 inches, insuring a minimum of friction (3½ feet per second, discharging 38,000 gallons per minute), which will greatly save in running expenses the slight excess of first cost incurred. The average of several tests, conducted personally by the agent of the Reclamation Company, showed its capacity to be 37,907 gallons per minute at a lift of 11 feet 7 inches, the engine indicating 156-horse power, with a consumption of 4.4 pounds average Sydney coal per actual horse-power of water raised per hour, the most satisfactory and economical showing so far made by any pumping plant.

This district was at first in the hands of Mr. Pearson, after whom it was named, but finally came into the hands of Mr. P. J. Van Lohensels, at a time when it was really worth about \$3 per acre, there being about 9000 acres in the tract, surrounded by a dike or levee 1½ miles long. The pumping appliances made by the Tool Company were erected under the supervision of Mr. P. J. Van Lohensels, to whom the success of the Pearson reclamation district is largely due.

He was very energetic and untiring in his efforts to carry out the plans, and was confident of ultimate success.

The whole island is now under cultivation, and the land is worth all the way from \$100 to \$150 per acre, and in some places more, where improvements have been made. This pumping machinery is only run during the winter months, and in ordinary years, the two 15-inch pumps will take care of this district, the large 30-inch pumps only being used as a precaution against rains and freshets. This is the largest reclamation plant in the United States.

"Andrus Island."

At Andrus island (Reclamation District No. 407) a ten-inch turbine was at first put in. When it was put in operation in May, 1884, there were from 800 to 1000 acres of tule land under water, varying in depth from a few inches to

SECTION ACROSS BLACK RANGE AND VERDE VALLEY.

four feet. This water was all pumped out in two months, and in October a crop of buckwheat and beans was being harvested from land which was three feet under water in May. Since then they have made a change and replaced this pumping plant with two 16-inch submerged pumps and one compound condensing engine, with suitable condensing apparatus and boiler capacity to raise 33,000 gallons of water per minute. This has all been done under the supervision of J. C. Pierson, C. E. of Sacramento, and chief engineer of Reclamation District No. 407.

The fourth plant is on the land of Geo. F. Smith, at the edge of the river near Stockton. It is a submerged centrifugal pump, plain slide

It will be seen from what we have said that the engineering problems connected with the reclamation projects in California were by no means simple. The San Francisco Tool Company having had great experience in the construction of the drainage machinery, now know exactly what is required in special cases. Of course we have only mentioned a few of the plants constructed by this company. At the Pearson district and Tyler island, especial pains were taken to put up suitable buildings for pumping stations.

The Black Range Copper District.

The copper mines of the Black Range are situated in Yavapai county, Arizona, some 60 miles south of the Atlantic & Pacific railway, and 20 miles east of Prescott. They remained un-

the sandstone, capped with lava of variable thickness. In the distance are seen the snow-covered peaks of Mount Agassiz, some 13,000 feet in height. Mount Agassiz is an extinct volcano and the source of an enormous lava-flow, covering the ground from the Verde valley to the mountain, some 40 miles distant.

In 1883, the mines of the Black Range were first opened on a considerable scale. Roads to the Atlantic & Pacific Railway and Prescott were built; houses and smelting plant were erected. Smelting was begun with a 42-inch furnace in August of that year. True yellow sulphurets are found in these mines, with some silver and a little gold.

Blasting Plug for Timber.

Powder for splitting logs is largely used on this coast, where our trees are of great size. Wm. T. McCall, of St. Clair, Alabama, has patented an improved means of splitting logs, which is especially applicable to long, thick logs. We give an engraving on this page which shows his plan. A designates the section of a tree-trunk of about 22 feet long and 2½ feet in diameter. B is a canal, preferably of circular section, made on a radial line of the log at about the central point of its length. The canal, B, penetrates to a proper distance on the opposite side of the axis of the log.

C is a cartridge filled with gunpowder or other proper explosive, and made to fit snugly in the canal, B. The cartridge is of suitable length to lie, when inserted to the bottom of the canal, with its center in the axial line of the log. c is a central opening through the outer end of the cartridge-casing. D is a block of metal, preferably cast iron, having the extension, E, and the head, F, as shown. The extension, E, is of proper shape to be inserted snugly in the canal, B, upon the cartridge, C, and is sufficiently long to be used with logs of different diameters.

E is a central longitudinal canal through the extension with its outer end bending upward or outward in the head, F, and ending in an orifice, c. The inner orifice of the canal lies upon the opening, c, of the cartridge. The head, F, of the block, D, is provided on its outer end with the re-entering shoulder, f. G is a metal bar, preferably of cast iron, which, in practice, has its upper end formed to fit within the shoulder, f, and has its lower end braided against the metal block or bar, H, which is driven into the ground.

In practice the block, D, weighs about 12 pounds and the bar, G, about 40 pounds. The bar, G, is about four feet long, and the block or bar, H, about two feet long, with one-half its length driven into the ground. The log lies with the canal, B, on one side, and the canal, c, is properly primed up to the orifice, c, so as to fire the cartridge therefrom; or a fuse, I, may be inserted into said orifice and fired in the usual manner. It is found in practice that by these means the log can be split straight or into longitudinal sections. A light wad, i, is placed between the ends of the extension, E, and the cartridge when gunpowder or any material that does not explode by concussion is used; but if a material that is liable to explode by concussion is used, a spiral spring is placed between the extension and the cartridge to prevent such explosion. The inventor thinks that better results are obtained by the use of gunpowder and similar slowly exploding materials than by quickly exploding materials, which would be apt to break the log into small fragments.

SPLITTING TIMBER BY BLASTING.

valve engine, with a suitable boiler, with a capacity of 11,000 gallons per minute. The plant is highly successful, and keeps the land free from water.

The fifth is on what is known as Dr. Toland's ranch, near Rio Vista, where a submerged pump with a 50-horse power, single-acting engine and boiler, was put in under the supervision of E. C. Dozier, the capacity of this plant being 15,000 gallons per minute.

The sixth is on Tyler island, near Walnut Grove, for John Miller. That is a submerged pump, a compound condensing engine with the necessary condensing apparatus, with a capacity of 36,000 gallons per minute.

Those desirous of resorting to the use of pumps for the reclamation of land are referred to the Pearson Reclamation District, Tyler island, and District 407, Andrus island, as being three of the best reclamation pumping plants ever erected so far in this country. Mr. J. C. Pierson, C. E., who has devoted most of his time for the last five years to the construction of levees, etc., was the engineer in charge of putting the pumping machinery on Andrus and Tyler islands,

is crossed, which has some local importance by reason of the gold veins it contains. The Chino valley, covered with a heavy deposit of wash, is next reached, and no rock in place is seen until the west flank of the Black Range is approached. Here another belt of slate, striking northerly and southerly, is crossed; and then the limestone of the Black Range proper is reached.

This is a table-mountain, composed exclusively of limestone, the age of which has been determined as carboniferous, by the finding of the characteristic shell *productus*, so determined by Prof. J. S. Newberry. The limestone range is intersected by many dykes of an eruptive greenstone rock, generally from 40 to 200 feet in width. These dykes are found on the very crest of the mountain. Descending the eastern slope of the mountain, a belt of diorite is reached, and in this are the principal mines of the district.

The Hampton and Eureka mines overlook the Verde valley, which is a valley of erosion in Triassic red sandstone. The western slope of the Verde valley, seen from the Eureka and Hampton mines, presents bold escarpments of

SOUTHERN CALIFORNIA MINING NOTES.—S. P. Blade sends us the following notes from Daggett, San Bernardino county: There is a prospect that Los Angeles parties will build a 10-stamp mill next month at Soda Lake mining district, north of Lndlow, on the railroad line. Another one of similar capacity is projected at the Needles, on the Colorado river, by other men from the same city. The grading for the mill is now being done. A good body of galena has recently been found 55 miles below the Needles by Mr. Thomson. The vein is large and the ore of high grade. Silver has been going down, but the "gold bugs" will take a back seat in 1888 and bi-metalists come to the front. The prospects of the Daggett mines, even in gold, are good, as shown by the tests made.

MECHANICAL PROGRESS.

A New Locomotive.

The Specialties in its Construction and How They Worked on Trial.

At the meeting of the Franklin Institute, held at Philadelphia, Pa., March 16th, George S. Strong, of New York, described the "Strong" locomotive. On the 17th an experimental trip was made on a locomotive of this design, built by the Lehigh Valley Railroad Company, on which road it is in active use. The locomotive was used to draw a train from White Haven, above Mauch Chunk, to Wilkes Barre, and return over the Nesquehock mountains, a spur of the Blue Ridge.

The locomotive is peculiar in several respects. The boiler of the engine consists of two parallel cylinders bolted together and united by a hemispherical shell to a single cylinder which forms the interior portion. The total length of the boiler is over 30 feet. The shell is made of steel plates welded in the longitudinal seams and riveted by a double row of rivets in the circular seams. The fire-box consists of two corrugated steel cylinders, made on the same general plan as the boiler and united by the single combustion chamber, which occupies the hemispherical portion of the boiler, to the tubes. The object of the corrugations is to increase the heating surface and to allow of expansion and contraction. The two fire-boxes traverse the parallel sections of the boiler and are suspended at the middle by a sling, no stays or other supports being introduced. The grate-bars are hollow and connect with a chamber in the bridge of the combustion chamber, through which a current of heated air passes to finish the combustion of the gases generated by coal. The lining of one of these furnaces does not dampen the boilers, for the reason that the gases from the other are being consumed during that process. The valve-gear of the locomotive is peculiar in that it is double, one set of valves controlling the exhaust, the other the steam supply, but both of these are worked from a single eccentric attached to the axle of the driving wheels. The object of this arrangement is to allow a more complete expansion of the steam, and consequent increase of efficiency, without checking the exhaust and causing compression. The valve motion is controlled by a series of levers, and the valves, of the ordinary "gridiron" type, move vertically.

The engine (No. 444) of the Lehigh Valley service has six coupled driving wheels, 62 inches in diameter, on which there is a total weight of 90,000 pounds. Two trucks, one supporting the forward, the other the rear of the engine, bear respectively 27,000 and 20,000 pounds. The total grate area is 62 square feet; heating surface 1848 square feet. Her cylinders measure 20x24 inches, and she carries 160 pounds boiler pressure readily. The general appearance of the engine is very handsome. The cab is situated on the top of the boiler and about in the middle of its length.

The stretch of road over which the trip was made is a very difficult one, no portion of it being at a less gradient than 64 feet to the mile. At some portions the gradient amounts to 96 feet to the mile. The road has very numerous sharp curves, but is well laid and ballasted. From White Haven it is a steady climb of 11 miles to Glen summit, from which point the road leads downward 1400 feet in all to Wilkes Barre, a distance of 19 miles.

The train consisted of eight cars, two of them being parlor cars. Immediately after leaving White Haven a snowstorm commenced, which continued with greater or less violence during the trip. In spite of this severe drawback, the run to Glen summit was accomplished in just 20 minutes. From Glen summit to Wilkes Barre the run was made almost wholly by gravity, and was made in 33 minutes. The return trip occupied a somewhat longer time, owing to several stops. The train consisted of five heavy cars. The steadiness of the engine while running at high speed was remarkable, the motion in the cab, high above the rail, being scarcely more than that experienced in a passenger. —*Colliery Engineer.*

THE HEATING AND COOLING OF CAST STEEL.—It has been observed by Barrett, as recorded in the *Philosophical Magazine*, that if a bar of hard iron be allowed to cool from a white heat to dull redness, there is a spontaneous disengagement of heat, and its magnetic properties suddenly change. This phenomenon has been called recalcence; and M. Le Chatelier has also noticed that at about 700° C. there is a molecular modification of pure iron. In order, therefore, to see if recalcence is due to the heat set free by the modification of the iron, or if it requires the presence of carbon, M. Osmond has made a series of experiments which have been brought before the French Academy of Sciences. He operated with iron containing from 0.16 to 1.25 per cent of carbon. He has found the existence of two phenomena of the kind observed by Barrett. The first is due to the molecular transformation of the iron, the second is evidently recalcence, and corresponds to a change in the relations of the iron with its carbon. It takes place at 675° C., when thermometer suddenly stops and then rises to 681° C., afterward resuming its regular fall as the metal cools. This was observed with steel containing 0.57 per cent of carbon. With only 0.16 per cent of carbon a much lighter effect of the kind was noticed about

749° C.; this was probably due to this phenomenon noticed by M. Le Chatelier. With 1.25 per cent of carbon the two effects appear to confound themselves. When the proportion of carbon is increased, the temperature of transformation of the iron seems to be lowered and the temperature of recalcence raised, so that both come to coincide in hard steel. As a practical use of this discovery, M. Osmond proposes by this method to study the influence of impurities in steel.

The Advantages of Compound Locomotives.

Mr. V. Borries, the well-known German railroad engineer, makes the following statement on compounding in *Glaser's Annalen*:

The advantage of compound working may be stated as follows: In the ordinary locomotive with slide-valves and narrow ports, it is not very desirable to attempt more than three to four-fold expansion, and the steam is passed off at a pretty high temperature, which is utilized somewhat in the second cylinder of the compound machine. Furthermore, the shell of the cylinder naturally takes the mean temperature of the steam passing through it; and as the temperature of the expanded steam falls below this, it absorbs, before passing into the stack, a certain amount of heat from the cylinder shell, which has to be replaced from the entering steam. This operation in a compound machine takes place in the low-pressure cylinder only, since the heat absorbed by the steam from the other cylinder is utilized in the low-pressure one. The steam lost in the clearance spaces and in the leakage around the piston of the high-pressure cylinder is also utilized, and a more uniform pressure on the piston is attained for the same degree of expansion. With steam cut off at one-quarter stroke, the greatest force of the steam is exerted where it is least effective and produces more friction, while if we get the same expansion by cutting off at one-half and expanding into another cylinder, the action of the steam is obviously more effective. By the possibility of expanding two-fold, while giving full steam to one cylinder, and obtaining an eight-fold expansion by cutting off at one-fourth, greater and more profitable range is given to the engineman in graduating his cut-off.

With all these theoretical advantages, a practical average saving of fuel of 17.1 per cent over locomotives of similar construction with ordinary cylinders has been attained. This result is the average of the collective working of three compound engines—respectively freight, passenger and omnibus engines—working against seven different ordinary engines of similar class and weight, for periods of from three to nine months each. The boiler pressure carried on the compounds was 180 pounds, while that of the other engines varied from 135 pounds to 180 pounds. The valve-gear of these compound engines is just as simple as that of ordinary engines, the links for both cylinders being set by the same movement of the lever and not capable of separate adjustment. It is to be noted that in this system both slides receive together the pressure usually thrown upon one for a given quantity of steam used, causing less wear on the parts. Since the pressure on the pistons is more uniform throughout the stroke, and since the work is more equally divided between the pistons, these engines run very steadily; and this, with the smaller quantity of fuel burned, makes the repairs for machinery and boiler less than usual, in spite of the high boiler pressure carried. The great expansion of the steam diminishes the intensity of the blast so much as to cause little or no spark-throwing from the stack.

THE IRON PRODUCT OF THE WORLD.—It is worthy of remark that the United States was the only country in the world that made any notable increase in the production of pig iron in 1886 over the production of 1885, her increase being 1,640,017 tons. It is estimated that Russia increased her production 6000 tons, Spain 4000 and Austro-Hungary 17,000. On the other hand, the other principal iron-making countries of Europe show a total decrease of 920,225 tons, distributed as follows: United Kingdom 379,992 tons, Germany 411,972, France 102,495, Belgium 15,766, Sweden 10,000. Taking all the European countries named, they produced 893,225 tons less of pig iron in 1886 than they produced in 1885, while the United States, as stated, produced 1,640,017 more.

RAILROAD SLEEPERS IN INDIA.—The sleepers recently adopted by the Indian Government are of the transverse description to be used with the flange rail, and it is believed that the Indian Government have now pinned their faith to this particular kind of sleeper and rail as the results of experiments lately conducted when cast-iron sleepers and the old double-headed rail were put in competition with the newer designs. The rails weigh 75 pounds to the yard.

An engraving of Cunningham's new double-cylinder, reversing hoisting engine is given in the advertisement in another column. These engines are made for the Pacific Coast trade, with friction-brake, clutch, lever, etc., to adapt them to mining purposes, so the engine need not move when the load is running down. This engine has very few working parts and is simple in construction and operation.

SCIENTIFIC PROGRESS.

The Nature and Origin of the Elements.

It is very interesting to note that the tendency of the best scientific thought of the present day upon the subject of the nature and origin of the elements is unmistakably toward the view that these are essentially the same in respect to their ultimate constitution—that is to say, in being derived from a single material, and that the differences between them are due to secondary causes.

The opinion that the 60 odd different forms of matter which are recognized by chemists are so many distinct primitive forms of matter, was universally entertained until a comparatively recent period. It was, indeed, one of the fundamental ideas which clearly distinguished and marked the departure of modern chemistry (as developed by its great founders, Scheele, Priestley, Lavoisier and other worthies of the last century) from the vagaries of the alchemistic period of the science which preceded it.

The change of opinion on this subject, which has been slowly taking place during the past 20 years, is one of the most interesting examples of the kind that the history of science exhibits. As the case at present stands, the views of the leaders of thought in the chemical world are so far in accord with those of their predecessors of the alchemistic period, as to agree that the transmutation of one element into another is a thing which is not inherently impossible. This admission by no means involves the acceptance of the various crude and extravagant hypotheses of the alchemists, nor does it involve a belief in the claims—in those days generally believed—that the transmutation of the baser metals into gold had been repeatedly accomplished.

The modern view of the origin of the elements was admirably expressed in a most interesting address delivered at the last meeting of the British Association for the Advancement of Science, by Dr. William Crookes, F. R. S., one of the ablest representatives of science, whose remarkable researches in "Radiant Matter" have won for him an imperishable renown.

Dr. Crookes, in his address, treated of the question here under discussion—namely, whether the various so-called elementary substances (hydrogen, chlorine, iron, gold, etc.) are to be considered as ultimate and primitive forms of matter, or, rather, as different secondary forms of a single primitive form of matter. His conclusions are summed up in the final sentence of his address, as follows: "We cannot, indeed, venture to assert positively that our so-called elements have been evolved from one primordial form of matter; but we may contend that the balance of evidence fairly weighs in favor of this speculation." This hypothetical primordial matter Dr. Crookes provisionally terms "protyle." We shall revert further on to Dr. Crookes' view on this subject, and, meantime, give some little consideration to the reasons on which this general change of sentiment among chemists is based.

The principal reason is found in the fact of the division of the so-called elements into groups, the members of which resemble each other so closely that their separation and identification are often a matter of extreme difficulty. This inter-relationship would appear to be inexplicable on any other grounds than that of a derivation, by a process of "inorganic evolution," from a common source. The relationship of the elements above referred to has found its highest expression in the "periodic law" formulated by Mendeleeff and Mayer, by which it is shown that when the 60 odd elementary bodies are arranged in the order of their atomic weights, beginning with hydrogen (the lowest) and ending with uranium (the highest), they form a series of groups, the chemical and physical properties of which are closely related, and vary with great regularity. According to this "periodic" law, Mendeleeff elaborated a number of hypothetical series, into which all the known elements were naturally grouped. A number of members of these series, however, were missing—that is, there were no known elements which conformed to them. Nevertheless, he indicated their positions in the series, and ventured to predict what their physical and chemical properties should be, and, remarkable as it may appear, those predictions have been verified in at least three cases, namely, in the case of gallium, scandium and germanium—three elements which have been discovered during the past few years. In each of these cases the newly discovered element fitted so perfectly in its appropriate place in the break in the Mendeleeff series that the significance of the periodic law as the expression of an order of nature is no longer a matter of doubt.

The existence of compound radicals, such as cyanogen, ammonium, etc., which, though they are compounds, are in all respects analogous in their chemical behavior to elements, and the so-called allotropism of certain elements, in virtue of which carbon, for example, exhibits itself to us in three distinctly different conditions, oxygen in two, etc., are inexplicable on the assumption that our so-called elements are essentially different in their ultimate constitution.

That there is a remarkable connection of some kind between the elements, the foregoing facts clearly demonstrate. Just what it may be, we are, in the present state of our knowl-

edge, unable to determine demonstrably; but by analogical reasoning we would seem to be justified in accepting this relationship as evidence of a derivation from the same primordial substance.

In conclusion, it may be of interest to quote from Dr. Crookes' address a passage embracing his speculations as to the manner in which the several elements may have been derived from his hypothetical "protyle," on which point he has the following:

"Of all the known elements, the one of simplest structure and lowest atomic weight is the first to come into being. For some time hydrogen would be the only form of matter (as we now know it) in existence; and between hydrogen and the next formed element there would be a considerable gap in time, during the latter part of which the element next in order of simplicity would be slowly approaching its birth-point. Pending this period, we may suppose that the evolutionary process which was soon to determine the birth of a new element would also determine its atomic weight, its affinities, and its chemical position. In the original genesis, the longer the time occupied in that portion of the cooling down during which the hardening of the protyle into atoms took place, the more sharply defined would be the resulting elements; and, on the other hand, with more irregularity in the original cooling, we should have a nearer approach to the state of the elemental family such as we know it at present. In this way it is conceivable that the succession of events which gave us such groups as platinum, osmium and iridium, palladium, ruthenium and rhodium, iron, nickel and cobalt, if the operation of genesis had been greatly more prolonged, would have resulted in the birth of only one element of these groups. It is also probable that, by a much more rapid rate of cooling, elements would originate even more closely related than are nickel and cobalt, and thus we should have formed the near-allied elements of the cerium, yttrium, and similar groups; in fact, the minerals of the class of samarskite and gadolinite may be regarded as the cosmical lumber-room where the elements in a state of arrested development—the unconnected missing links of inorganic Darwinism—are finally aggregated."—*Manufacturer and Builder.*

IN A CHANGING WORLD.—Geologists have described Britain as swarming with a multitude of forms of gigantic reptiles, some of them 60 feet or more in length, during the reptilian age—the middle period in the earth's geological history, when mollusks and reptiles attained their culmination and declined, and when the first mammals and the first birds appeared. A striking picture of England at a later epoch—the middle of Quaternary—is given by Owen: "Gigantic elephants, of nearly twice the bulk of the largest individuals that now exist in Ceylon and Africa, roamed here in herds, if we may judge from the abundance of their remains. Two-horned rhinoceroses, or at least two species, forced their way through the ancient forests, or wallowed in the swamps. The lakes and rivers were tenanted by hippopotamuses, as burly and with as formidable tusks as those of Africa. Three kinds of wild oxen found subsistence in the plains. There were also gigantic deer, wild horses and boars, a wild cat, lynx, leopard, a British tiger larger than that of Bengal, and another and even more terrible carnivorous monster with saber-shaped canines eight inches long. Troops of hyenas preyed upon dead carcasses and feeble quadrupeds. There were a savage bear larger than the Rocky Mountain grizzly, a gigantic beaver, wolves, and various smaller animals, down to bats, moles, rats and mice."

MANUFACTURE OF CARBON.—The following item, says a correspondent in the *Electrical World*, I have picked up, and it ought to be of interest: "The manufacture of carbons for electric lights has become an important business. At a trial in Cleveland for alleged infringement of patent, a witness testified that 150,000 carbons burned daily in the United States; 100,000 are manufactured in Cleveland, where there are 20 furnaces. The carbons are made chiefly of the residuum of oil after it has been refined, but the deposit about natural-gas wells is also coming into use. The material is ground to a powder, a little pitch is added, and the substance is then placed in molds. These are packed in boxes and the latter placed in a furnace, where they are subjected to the most intense heat. The capacity of an ordinary furnace is 45,000 carbons. Through the use of a movable furnace roof, the patent on which forms the subject of contention, two furnaces are constructed side by side, and while the carbons in one are being burned, the other is loaded with boxes of molds. Under this system, two men load a furnace in one day, the carbons are thoroughly burned in five days, and the cooling process continues only 24 hours."

SEPARATION OF IRON FROM CHINA-STONE BY ELECTRICITY.—At Par, Cornwall, a process described as the "extraction of iron from China-stone by means of electricity" has been for some time under experiment by the St. Austell Mining Company, and plant is now being laid down for the permanent application of the process upon a commercial scale.

TELEPHONES IN ENGLAND AND IN THE UNITED STATES.—This country has over a quarter of a million telephones in use. England has only 13,000.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BRET-PULLER.—Robert R. Barrows, Potter Valley, Mendocino Co. No. 361,205. Dated April 12, 1887. This is a garden implement specially adapted for the pulling of those vegetables having roots or bulbs which grow in or partially in the ground, such as beets, turnips, carrots, etc. The invention consists in a handled blade adapted for gripping one side of the vegetable and a peculiarly curved fulcrum lever pivoted to the main handle or blade, and having a blade adapted for gripping and binding on the other side of the vegetable. The distinguishing feature of this implement lies in the employment of an auger lever which enables its foot to act as a fulcrum, and concave blades adapted to enter the ground and grasp the root or vegetable.

GRAIN-DRIER.—Lewis Borland and T. J. Parsons, S. F. No. 361,126. Dated April 12, 1887. The grain is put in a garner or hopper, and thence passes down its throat, completely encircling the steam heater, so that in its passage it receives the necessary preliminary heat. The throat being perforated provides an escape for the heat so there will be no condensation and the grain will not be moist. The entire operation of the drier is automatic, there being no shoveling necessary. By the arrangement of hot air chambers the grain, as it passes the upper series, receives the heat directly on one side, and as it passes the lower series receives it directly on the other, so it never has to be turned.

COOK STOVE OR RANGE.—Francis Jackson, Oakland, No. 361,064. Dated April 12, 1887. This patent has been issued for certain very important improvements in cook stoves and ranges by which a great saving of fuel and economy in the application of heat to the different parts of the stove or range are obtained. One of the principal features of the invention is the series of hinged adjustable grates, which may be tilted so as to increase or decrease the capacity of the fire-box, which enables the user to make as large or small a fire as may be necessary for various purposes; in connection with this a curved-end grate or grates, within the vertical bars of which the ends of the fuel-supporting grates are moved, and in connection with these supporting grates are levers extending outside the stove so that they may be easily raised or depressed. The products of combustion pass through passages or flues down beneath the oven, thence up around its sides and over the top of the stove through proper regulating passages or dampers, which enable the operator to regulate and adjust the heat at will. The sides surrounding the oven are made in corrugated or wavy outline, which considerably increases the heating surface, and a scraper which is made to fit this outline is easily moved backward and forward by exterior knobs or handles, so that all soot or ashes or other deposit can be easily removed by one motion of the scraper back and forward. There are many details of construction which could not be well explained without an engraving, and which go to make up a very perfectly operating range, and one which promises to take an important place in household economy.

PROFESSIONAL FATIGUE.—Medical and other professional men often break down from their inability to keep a regular time for meals. An eminent doctor says: "Being often out for many hours, and becoming too exhausted to digest a full meal when at length able to get it, I conceived a plan which answered admirably well, and which other doctors have gladly adopted. I provided myself with a small bottle of lime-water, which I add to a glass of milk when passing a dairy shop; or I put a small flask of the mixture in my pocket. A water biscuit with this will keep a man harmless on a long fast, and enable him to digest a meal when he can obtain it."

THE LARGEST MINE-EMPLOYER.—It is said that W. L. Scott, of Erie, Pa., employs no less than 10,000 men in and about his many coal mines. This would make him the largest individual employer in the coal industry of the world, a position similar to that occupied by Krupp, of Essen, Germany, in the iron industry, the number of whose employees is said to be 26,000. Who that has ever studied the history of these two giants in the industrial world but must admire the indomitable energy and enterprise which characterize both men; yet who can help but wonder at the dissimilitude between the two in the management of their vast army of employees?

DRAW-GATE.—S. T. Coulter, of Santa Rosa, Past Master of the State Grange, has invented a draw gate that has many excellent features for opening and closing. He has placed one on his farm at the main entrance, which has been in practical use for some time. Any person can open and close the gate with but little effort while sitting in a buggy. We expect soon to illustrate this gate with full description in the *Rural Press*. From a cursory examination, it seems to be in cost and adaptability one of the best if not the best gate that has been placed before the public.—*Pacific Rural Press*.

GOOD HEALTH.

Bathing, and Why We Should Bathe.

Among all the appliances for health and comfort to mankind we may safely say there is nothing so well known, so useful, and withal so comforting, and yet so little practiced, so carelessly and thoughtlessly neglected, as judicious bathing. The skin of the human body, from head to foot, is a network of pores. One cannot put a finger on a single place without covering several hundred little openings, which ought always to be kept free and clear of obstructions. As evidence of the truth of this statement, we need only call to mind the great drops of sweat so often seen gathering on one's face and other parts of the body in warm weather, especially during the time of over-exertion. These pores are the openings into minute tubes or channels, which lead through unseen meanderings into the sanctum of life within.

The dust which comes into contact with animals covered with hair is mostly kept out, and the perspiration conducted away from the pores of the skin by those hairs; hence bathing is not so essential with them as with mankind, whose bodies are practically denuded of such protection. The glutinous mass of perspiration, dust and filth which gathers on the surface of the body naturally covers and clogs the pores, and often enters them and poisons the system. To remove that filth, frequent ablutions and occasional immersion in water are exceedingly desirable, and usually indispensable to health and comfort; consequently, every family should have a convenient bath—and a full bath too—of some kind, not only for general neatness of person, so desirable to every individual of taste and culture, but as a means of preserving health, and in many cases, especially under the advice of a good physician, as the easiest, pleasiest and one of the most powerful and efficient means of combating disease.

Directed by good judgment and wise counsel, a bath is a valuable auxiliary to other remedies, and it can be used when internal remedies cannot. In the long catalogue of diseases to which flesh is heir, scarcely one can be named in the treatment of which a bath is useless. To those blessed with good health, a bath, as a common-sense appliance, gives thrift and growth to healthy functions, a brightness and delightful serenity, a clearness of mind and buoyancy of spirit. It is certainly a blessing to both mind and body. For the mental worker it is a nerve tonic. A thorough immersion in water of proper temperature will calm and give strength and tone to his whole system. The indoor laborer, who gets but a scanty supply of fresh air, needs a bath to obtain those invigorating elements so common in the open air. The outdoor laborer, especially the farmer, who works with heroic energy all day long, unavoidably gathers on the entire surface of his body a complete prison-wall of dust and thickening, gummy perspiration; and when his day's work is done he needs then, more than any other thing, not only a wash, but a good, luscious, full bath to fit him for a clean bed and a refreshing sleep.

Finally, every one needs a bath at times, and every human habitation should contain something for a complete immersion in water; and since convenient and efficient portable baths at comparatively low figures are now extensively advertised for sale, there is little excuse for any one to be without this priceless benefit.—*Western Rural*.

Mercury in the Human System.

Very elaborate experiments have recently been made by Dr. Welanders to determine how mercury is absorbed by and eliminated from the human system. Some of the tests for determining the presence of mercury were so fine that it was found in a solution of corrosive sublimate of one in 10,000,000.

The character of the experiments may be learned from the following results as reported in a German medical journal:

When mercury is given by the mouth, it appears, as a rule, in the urine one or two days later. Administered through the anus, it was already found the following day. When applied through the skin, it appeared likewise, as a rule, on the following day in the urine. Mercury is rapidly absorbed by wounds and ulcers.

Injected under the skin, mercury is very rapidly absorbed, and appears often in the urine as early as one or two hours after the injection.

Mercury is constantly eliminated with the urine; a very great part, and perhaps the greater part, of what has been introduced into the body leaves it in that way.

The salivary glands play quite a secondary role in this respect.

The faeces, on the other hand, contain constantly mercury, and often in considerable quantity.

Mercury is likewise eliminated with the milk, and was found in the urine of the nursing.

The elimination takes place in proportion to the amount introduced.

Welanders discredits the statement of Paechie and Vajda that mercury may remain for 12 or 13 years in the body. He has, as a rule, found it 4 or 6 months after the end of the treatment; frequently it is found from 6 to 12 months, and sometimes even more than a year, after the treatment has been discontinued.

Welanders thinks mercury circulates in a soluble form with the blood. He found it in abundance in this fluid in every case examined. He found it likewise in pus taken from patients treated with mercury, and in ascitic fluid.

This conclusion is drawn for practice from these experiments is that when a rapid and powerful effect is aimed at, the administration of mercury by hypodermic injections is preferable, while for the intermittent treatment of Fournier the mercurial pills will do as well.

Treatment of Bright's Disease.

The increasing prevalence of this disease renders any general information in regard to it, coming from an authoritative source, of considerable interest. We give the following from Semmola, of Naples, taken from an article published by him in the *Wiener Medizinische Blätter*. He advises strongly against allowing a patient who is suffering from nephritis to come in contact with cold in any avoidable way. Such patients are excessively sensitive to cold, and cold baths are followed by great shock and depression. Violent massage and exercise of the muscles the author also strongly deprecates as followed by great shock and weakness.

He would advise the patient to live in a dry and equable climate; to strictly avoid all exposure or going about in severe winter weather; to practice mild gymnastics in a comfortable room rather than venture into a temperature below 18 or 20° C. The author emphasizes the remarkable sensibility of the skin of the sufferer with Bright's disease to all variations of temperature. Sodium iodide and chloride is advised in doses as large as tolerated. When, after two or three weeks, albumen has not entirely disappeared and dropsy has been relieved, phosphates of sodium or calcium are given in quantities as large as 40 grains or a dram daily. The efficacy of these drugs the author believes consists in their power to promote the assimilation of albumen.

The methodical inhalation of oxygen, which Semmola has urged since 1867, has been repeatedly proved to be of the highest benefit. Albumen soon disappears after its use, and although casts may remain in the urine, the patient's general condition is so much improved that the author thinks we have here an argument for the dyscrasic or hæmatogenic origin of Bright's disease.

All astringents are considered not only valueless, but also injurious. Especially is the action of ferrum sesquichloratum and plumbum acetatum thought injurious, because of their astringent influence on the capillaries of the skin.

USEFUL INFORMATION.

Cocoa-Nut Fiber in Electric Piles and Accumulators.

The combination of the negative and positive electrode of each element with a plate of cocoa-nut fiber, or a plate of compressed powdered cork, saturated with the required chemicals, in substitution for the usual exciting liquid, is proposed by Mr. J. Crosse, of Paris. The elements thus formed as above are either placed in a suitable box of wood, cardboard or other non-conducting material, and a spring or other mechanism caused to press on the last plate to keep the whole in close contact, or they may be superposed in a vertical frame, or threaded on a cord fastened to the lowest plate, and passing through the center of the diaphragm, and of the second plate, and thus through the series of elements, in which latter case the weight of the elements acts in place of the before-mentioned spring. The use of these diaphragms enables the exciting chemicals to be used more concentrated, owing to the absorbing power of the cellulose in the cocoa fiber, and also produces a more equal wearing of the surface of the electrode. They also enable jars of glass, of porcelain, etc., to be replaced by wood, or even to be omitted altogether, giving thereby greater lightness and portability.

The fiber plate is saturated with the exciting and depolarizing agents preferably in such a manner that the former is brought into contact with zinc or other metal to be dissolved, and the latter with the electrode of copper or corresponding metal. When zinc and copper are used the fiber plate may be saturated with acidified water on the one side, and with solution of sulphate of copper on the other, or two fibers may be saturated, the one with acidified water, the other with the solution of sulphate of copper; and these two plates placed together to form one plate used as described. The fiber plates may be fed with the necessary solution or solutions by means of a tube or tubes from a reservoir, having orifices at suitable intervals, so that the fresh solution may drip on to the upper part of the fiber plates, also a trough, or the like, may be arranged below the plates to receive the used solution falling therefrom. In place of cocoa-nut fiber, powdered cork, or sawdust, or similar woody fiber may be used, the same being compressed in plates and saturated with the necessary chemical reagents. Or the plates may be made of a mixture of the said woody fiber with cocoa-nut fiber.

IMITATION DECORATIVE STONE.—Excellent imitations of stone, marble, terra cotta and such-like, for the decoration of buildings, for

statuary and other purposes, are produced by the process invented by Mr. D. Cottier, of Regent's Park, London. He applies powdered sandstone, freestone, brick, terra cotta, granite, onyx or marble, sand or dust, to any interior or exterior architectural work, either curved or plain, or to buildings or structures of all sorts, or to statuary, or ornaments made with stone, brick, plaster, terra cotta, cements of all kinds, or to stucco or other like compositions. The powder or sand of any of the above-mentioned substances is caused to adhere to the surfaces by means of paint made with oils, spirits, tars, varnishes, or other sticky materials which are insoluble in water. The powder, or sand, or dust is to be put on by a dredger, or thrown by hand instrument made for the purpose, or by an air blast, or engine driven by hand, water, gas, steam or electricity, or otherwise. It is claimed that work so done will withstand the wear and tear of climate and weather better than any simple paint, while at the same time the natural and artistic effects gained will be evident to all. By its application to the reproduction of stone or marble statuary and ornaments, the self-same look of the originals can also be given. In these cases the stone or marble would have to be reduced to a very fine powder.

Uniting Platinum With Other Metals.

An improved method of uniting platinum or silver and nickel or alloys of these metals in the manufacture of compound plates, wires, and the like has been introduced by La Société de Laminage du Nickel of Paris. The surfaces to be united should be as clean as possible and be filed, planed, or scraped, in such a manner as to facilitate an excellent contact of the two surfaces at all points. The nickel must, moreover, be in such a condition of malleability that the hammering or rolling which terminates the operation can complete the intimate contact of the metals. The surfaces to be united are powdered with any soldering flux, such as borax, and the two pieces are then subjected to a suitable temperature to render them sufficiently malleable for enabling the said pieces to be finally welded by hammering or rolling. In some cases the contact surface of one of the pieces can be electro-plated with a metal which, when the said pieces are placed together and heated, will constitute a solder.

In order that the welding shall succeed it is necessary to prevent the air from coming into contact with the said surfaces, which air would oxidize the red-hot nickel. For this purpose the following process can be employed, which process consists in previously inclosing the metals to be united in thin sheath or envelope of sheet iron, copper, or other metal capable of withstanding the heat. When, after suitable heating and hammering, the metals are united, the metal sheath or envelope is removed by scouring or scaling, or in any other manner. It is sufficient to fold the envelope closely around the pieces to be united in order to render it air-tight.

With the object of avoiding the union of the sheath or envelope with the metals to be united, they coat the said sheath or envelope on its internal surface with a layer of magnesia, lime, oxide of zinc, or other substance having similar properties, in order to prevent the internal contact of the envelope with the metals to be united. When the union of the pieces is once effected, the envelope can be easily removed. If desired, nickel wires can be coated with platinum in the manner hereinbefore described. In this case the platinum covering is bent into the form of an open tube which is closed around the nickel after the latter has been inserted therein. Nickel plates and wires coated in the manner hereinbefore described with platinum, or silver, or alloys of these metals, are adapted for the manufacture of receptacles and utensils which are of use in pharmacy, in chemical laboratories, and in certain industries, by reason of their perfect resistance to the action of acids and alkalis.

STAINING AND FINISHING COMMON WOODS.—A correspondent of the *Wheelwright* desires to know how to stain and finish common woods in imitation of walnut. He does that kind of work, but it looks dingy and black and not at all nice. The answer is given as follows: To stain common woods, as pine, whitewood, ash, oak, etc., to imitate black walnut, take burnt dry umber and mix it with stale beer or with water, to which a little sugar has been added; rub the wood over with the solution, using a sponge or rag, and then varnish when dry. Another excellent stain to imitate black walnut is made by taking 2 quarts of rain-water, adding 3 ounces cal-soda, 4 ounces vandyke brown, and one-half an ounce of bichromate of potassa, and boiling the mixture for 15 or 20 minutes. It can be applied with either a brush or sponge. When dry, varnish (hot or cold). Woods that are stained will finish up nicely if the first coat of varnish be shellac varnish, as that having a spirit varnish assimilate better with the stain coat and enriches it. Beside, it prevents the copal finishing or rubbing varnishes from striking in.

TESTING COALS.—A simple means for testing the value of different kinds of coal would fill the proverbial "long-felt want." It should be something that any man of ordinary intelligence can use and understand, and from which he can obtain results accurate enough for practical purposes.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Ledger, April 23: At the depth now reached in the Wildman shaft is found to be only three feet wide, which necessitates considerable work in enlarging it. So far they have made the enlargement from the footwall side, and in so doing have encountered a body of quartz of good quality. The Mabony is still running 40 stamps. The copper plates have been widened to five feet, and the sluices have been copper-plated their entire length. A party of Italians, working a gravel mine a few miles up the creek, took out a chunk of gold worth at least \$100. It was found about three feet from the surface, round in shape, and perfectly smooth. The new pipe for the Amador canal is making rapid headway. Over one-half of it is finished and ready for laying. The company has a force of men at work digging the ditch between the Kennedy mine and the canal, and the work of laying will be commenced next week.

COPPER.—Amador Dispatch, April 23: Work was commenced on the Newton Copper mine, between Jackson and Lone, a few days since, pumping the water from the shaft, preparatory to taking out ore. A new process of working will be adopted, by which it is thought this mine will be made to pay very handsomely. The work, which has been carried on at these works for some time past, has been principally, we understand, the placing of old iron, etc., in the copper water, and then save the metal which is accumulated and formed thereon. It is said that the ore in this mine is of a very good character, and we believe it will pay to work it on an extensive scale.

GOVER.—Amador Ledger, April 23: This mine is looking better than for some time past. They are making extensive improvements in the shape of additional machinery. The mill has shut down a few days to enable a new Knight wheel to be placed in position. It is the intention to put in Frue concentrators shortly, and also a rockbreaker. Some remarkably rich ore was extracted last week.

MISCELLANEOUS.—It is reported, on good authority, that the Hardenburg or Casco mine, at Middle Bar, has been sold to San Francisco parties, and that the south extension, owned by Mrs. Sargent, is also likely to be sold to the same parties. The Hardenburg has been idle for many years. The resumption of work on this property will be hailed with pleasure by the residents of Middle Bar and vicinity. At the McKenzie Bros.' mine, about five miles east of Jackson, affairs are wearing a very flattering outlook. They have two claims. In one a ledge from five to seven feet wide exists. The ore is of very high grade, assaying as high as \$100 per ton. It is of a rebellious nature, however, and cannot be worked by ordinary mill process. A mill has been shipped from San Francisco to be erected on this claim. This is for the purpose of reducing the ore to pulp, all of which will be saved and sent either to San Francisco or Denver for treatment. Satisfactory arrangements have been made with the railroad companies for the transportation of ore at reduced rates. A large quantity of 15-inch pipe has been made which is intended to bring water to both claims. The Bunker Hill paid its employees last week the two months wages due them. This is satisfactory evidence that the bullion production is on the increase. The work of retimbering the old shaft of the Original Amador has been commenced. It is to be retimbered for 700 feet. A Bryan roller quartz-mill is expected up this week. Messrs. Reed & Askey made a cleanup at their small mill near Irish-town, last Tuesday. The yield was \$7 per ton, which is enough to pay the running expenses. At the Amador gold mine sinking is progressing at the rate of two feet per day; the rock is soft and blasts easily. W. A. Nevills and Capt. Nichols went to San Francisco Tuesday morning to meet Senator J. P. Jones, and arrange matters, if possible, in regard to the big tunnel. George Thomas has been engaged as foreman of the quartz and copper mine at Campo Seco. Water-power hoisting machinery is to be placed over the north shaft of the Kennedy mine.

Butte.

BIG BEND TUNNEL.—Record, April 23: Mr. Harris, the superintendent of the work of enlarging the tunnel at Big Bend, is of the opinion that the work will be completed in August, and that mining in the channel will be commenced in the fall. Of course it will be too late to do a great deal before next winter's rains commence, but enough will be accomplished to test the wealth of the channel. He is confident of rich returns from the mine, and all old river miners agree that the Bend is rich in gold. In places, where it was mined in early days, it proved to be fabulously rich, and not one-hundredth part of the channel has ever been thoroughly mined.

Calaveras.

WILL RESUME OPERATIONS.—Calaveras Chronicle, April 23: The What Cheer gravel mine, which has lain idle for some time, will be reopened again, work commencing next week. Mr. John Brackett, one of our most experienced gravel miners, having an experience of over 30 years in that character of mining, has been given the superintendency of the operations.

El Dorado.

THE ALPINE.—Mountain Democrat, April 23: The Walker Brothers, of Salt Lake, who it was reported were about to purchase the Slate Mountain mine, were at Georgetown and vicinity last week, and decided not to purchase that property, but to put work on other properties they own in the county. It is reported that they will soon do extensive work on the Alpine mine, near Georgetown. F. R. J. Dixon is pushing work ahead rapidly on the Revenge mine at Greenwood, and is now working a day and night force. T. G. Elty, of Greenwood, has recently discovered and located a quartz ledge near Greenwood, which is showing up well, and which is so promising that arrangements are being made to sink a shaft and develop the property. The old Shaw mine near El Dorado, which in days gone by has been such a rich producer, has, we hear, been bonded to Mr. Morgan of the Volante, and others, who will again work the property. The Independent mine, near El Dorado, recently purchased, is at once to be operated by new owners.

Capt. Staples is doing some work on properties in the vicinity of El Dorado, and we hear has several enterprises on foot. He will soon open out several properties in that vicinity. The El Dorado mining district is having a decided boom at present. The new quartz-mill recently brought up from Amador county for erection at Poverty Point is nearly in place, and will soon be in running order. The parties interested have moved up from below and are now living on the claim. Work is being pushed on the property, and soon the clatter of stamps will be heard.

LUCKY.—Georgetown Gazette, April 23: Two miners, who claimed to be greenhorns at the business, brought in to one of our merchants a few days ago about \$26 in gold as the result of a day's prospecting, one piece being worth \$18. We did not learn names of the parties; they are working at the Burnham mine and were out panning while the mill was temporarily shut down. A week since, Dr. Spencer, or rather his foreman Cad and George, struck in the face of their tunnel a large stream of water which came out in great force, causing a suspension of work for a time. The flow continued unabated for two days, since which time it has steadily flowed a five-inch stream. The tunnel is in over 100 feet, and if the water continues to increase in the next 200 feet as it has in the first 100 feet, the doctor will have enough water to run his contemplated quartz-mill.

Fresno.

HILDRETH.—Fine Gold Miner, April 22: The work of development in the Francis-James mine still continues and the results are in every way satisfactory. As depth is attained there appears to be an increase in the value of the sulphurets, while the ore carries the usual amount of coarse gold, and it is supposed that 10 more stamps will soon be required at the mill, as well as additional concentrators. Its successful development is another teststrike for the camp. Supt. Wallis, of the Hildreth mine, is meeting with success, and ore full of free gold is constantly being hoisted to the surface. The new ground opened up since Mr. Wallis assumed the superintendency has given results second to no other mine in the district, and that the yield of bullion will well repay the enterprise of the management there can be no doubt. In the face of the east drift on the second level there is two feet of solid quartz showing considerable coarse gold, and improvement is noticed as the mine is pushed forward. The ore taken from this point in the mine will mill from \$80 to \$100 per ton, including sulphurets. Everything around the Abbey mine presents a lively appearance, and work goes on in the same steady way as usual. The mill is crushing ore taken from the upper levels. The ore maintains its accustomed richness. The tunnels in the Morrow mine are being driven ahead rapidly, and in tunnel No. 3 a fine body of high-grade ore has been encountered. Mr. Morrow has leased the Hanover mill and will shortly put through 500 or 600 tons of ore. The favorably situated Rough & Ready mine, owned by F. Knoblock and the Baker Bros., of Fresno City, is looking up. Prospecting is being done with satisfactory results, the ledge holding its own in size and quality. The ore from actual milling tests runs \$35 a ton with rich sulphurets. Mr. T. Scully reports everything lovely at the Cascade mine. While opening up new ground in the tunnel there is a marked increase in the percentage of sulphurets, which have been demonstrated to be very rich. Considerable prospecting is being done, not only around the Hildreth, but also in the vicinity of the White Rock mine, and we understand that several good finds have been made. H. Towers and Jas. Kirby have struck some fine ore in the White Bear (an extension of the Hanover), and more favorable results are anticipated upon development. Louis Wilson will soon start sinking upon his ledge, seeing what water he has to contend with is surface seepage only. The ore in the sump is two feet wide. Upon the foot and hanging-wall a vein of clay gouge follows the ledge that also prospects well. From the satisfactory returns of the 25 tons worked at Smith's astrata, Smith will have the working of all ore from this property hereafter. Harry Lee and Byrnes have one of the best prospects east of the McNally mine, and we understand Robinson & Clark have secured the extension. As the ore is brought to the surface it is run through their astrata and pays \$30 to the ton. The sulphurets run off in the tailings.

Inyo.

MODOCK DISTRICT.—Inyo Register, April 21: Mining is very active in this district, there being 22 men at work at the Modock and Minnieta mines. Frank Fitzgerald has shipped 94 tons of high-grade ore to San Francisco since the 2d of March, besides sending 105 tons to the furnace. Smith & Wallace have three carloads of rich ore sacked for shipment at the Minnieta. Coal and wood are being delivered at the Modock furnace, and Fitzgerald will fire up about the 20th of May, for a run of 15 days at least.

Mono.

BODIE.—Upraise from the north drift, 700-foot level, was driven 13 feet. The Bodie and Mono joint winze was sunk 12 feet in broken vein matter. The east crosscut, 900-foot level, was extended 36 feet. The water is down below the 900-foot level 63 feet.

MONO.—West crosscut, No. 2, 800-foot level, was driven during the week six feet in hard rock. The east crosscut from the south drift was extended 18 feet. The joint Mono and Bodie winze was sunk 12 feet, and shows no change.

STANDARD CON.—Ore shipped to mill for the week, 308 tons. Mill running steadily. Bullion shipment was made on Wednesday, the 20th.

Nevada.

MILL.—North San Juan Times, April 22: The General Grant Mining Company is making preparations to construct near the mine a ten-stamp mill and to run a tunnel to tap the ledge 500 feet below the surface. The company is incorporated. The mine is believed to be a good one. The owners are abundantly able to develop it, and as they are men of push and perseverance the mine will be developed rapidly.

COE MINE.—Grass Valley Union, April 26: Good progress is being made toward the erection of the new pumping and hoisting works on the Coe mine, and Mr. A. W. Stoddard feels confident that he can start to pumping by the 1st of June. The works will be driven by water-power, a pressure of 220 feet being obtained. The water will be brought from the main canal on Town Talk ridge by means

of a ditch to a reservoir on the high ground west of the Nevada road, and from thence, a distance of 1800 feet, a pipe-line will be laid to the works. Ample power will thus be secured for doing the work required.

Placer.

ORO FINO.—Placer Argus, April 23: J. E. Shea is hard at work on his quartz mine, known as the Oro Fino, and will probably ere long reap a golden reward. The mine, which is about three-quarters of a mile from town, this side of Baltimore Ravine, was located eight or ten years ago by a Mexican named Manuel, who took some very rich rock out of the surface at various places. The mine since then has been prospected by means of an incline shaft on the ledge, and the vein which runs in an east-and-west direction is three feet wide at the bottom. A drift recently begun has been run westwardly some 60 feet in the expectation that it will strike the pay chute. It is in good ore—ore which is uncommonly rich in sulphurets. During the past week a whim has been erected for the purpose of facilitating hoisting operations.

SALE OF A QUARTZ-MILL.—Placer Herald, April 23: The old Pioneer quartz-mill, at Ophir, which was built originally as long ago as 1853, and which has always been run as a custom-mill, was sold a few days ago by Messrs. Lavalle & Hanson to Johnson & Kidd, of San Francisco, who have also bought the Plate ranch and mine. The purchasers have already gone to work to refit the mill throughout, and to add concentrators and other desirable improvements. They will put up also, in conjunction with the old mill, the Wiswell roller-mill, and thus be able to give customers their choice of either system.

Shasta.

POTOSI.—Shasta Courier, April 23: The resumption of work on the Potosi mine at Muleton, seven miles south of Shasta, which mine has been idle for about 20 years, gives rise to lively anticipations. A mill of very crude pattern was placed on the mine some 25 years ago, and the works were run in a wretchedly slipshod manner, but the rock worked averaged \$60 to \$75 to the ton, and the last few tons worked yielded \$90 per ton. The striking of a large body of water in the shaft caused the flooding of the mine, and as no adequate pumping machinery could be procured within the means of the stockholders, the works were doomed to lie idle. John P. Jones finally became proprietor, secured a patent to the mine, and has let it lie idle on account of having "too many irons in the fire." The ledge is well defined, from two to four feet in width from the surface to the bottom of the 66-foot shaft, and it is the opinion of all who have owned in or worked in the claim that it is one of the best and most promising in the county. Senator Jones also owns the Clear creek canal, 40 miles in length, which cost \$100,000. This canal is three feet on the bottom, built with sloping banks, and intended to carry a depth of three feet or thereabouts of water. The great hegira of miners from this county to Montana, Idaho, and other gold fields, and the slight development of quartz and agriculture and horticulture on the scope of territory covered by the canal, caused a temporarily limited demand for water; and, therefore, when several of the large, high flumes went down before the forest fires and storms, 30 miles of the canal was left to utility. The vast placer, quartz, agricultural, viticultural and horticultural possibilities and realities under the line of this canal, plead and languish for its restoration and the renewal of the water flow. It is ardently hoped that Senator Jones will not only go ahead with his Potosi mine, with new machinery, but will also restore to practical use the most valuable water right in the county.

BULLYCHOOP.—Cor. Shasta Courier, April 24: Bullychoop has an altitude of 7200 feet, and is a portion of the range dividing Shasta and Trinity counties. Taking Cleveland as a central point, the quartz deposit seems to run northwesterly to north fork of Indian creek, distance of nearly eight miles, and southeasterly near eight miles of Sunny Hill, the last named eight miles being on the Jerusalem slope. Near one-half of the first eight miles mentioned is located, and several claims patented.

DEVELOPING.—Courier, April 23: The work of developing the Wm. T. Coleman mines this side of the Dingee place, and three miles from town, is going on at a lively rate. A boarding and lodging-house has been erected for the employees, and as large a force of men as can be worked to advantage is busily engaged on the mine. Other buildings, and probably machinery, may soon be added.

Sierra.

MILL.—Mountain Messenger, April 23: Twelve stamps are running at the Cleveland quartz mine, Sierra City; 33 men employed. A. W. Crowell is superintendent, Martin Carroll, clerk, and George Black, head amalgamator. The upper main tunnel is in 578, and the lower one 665 feet. Yield of the ore is good. Altitude of the ledge about 4500 feet above the sea. Twenty stamps in the old Hitchcock mill, of the Sierra Buttes Co., are being refitted to crush the ore left in the dumps at the upper part of the mine.

Siskiyou.

PICK AND PAN.—Yreka Union, April 23: Gov. Daggett finished crushing at the Black Bear last week. Over 520 tons of rock were bailed from the mine to the mill since last July. It is estimated that the rock will yield at least \$40 to the ton. Mr. Daggett is now straightening up his short line railroad, and when it is completed will run quartz to the mill by a little donkey engine. The mines at Scott Bar are looking promising, to say the least. The Quartz Hill Co. is working day and night. J. Brunt & Co. have pumped out their drift and are on to good pay. The Klamath river mines are working, except the Fort Jones. The season bids fair to be prosperous in this section. The Centennial is washing good gravel, and the pay channel has been struck in the Phil. Mott. Fifty ounces of dust was taken out of the Quartz Hill claim at Scott Bar in one day last week.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—Enterprise, April 23: On the 1435 level still continue stopping out ore from the bottom of winze No. 2, 165 feet south from the south line of the Ophir mine. Are still injecting the carbonic acid gas into the burning

section at the rate of 40,000 cubic feet a day. A second gas furnace will probably be set up, which will shorten the operation of extinguishing the smoldering fire. The usual amount of ore is being hoisted, and the average assay of battery samples is about the same as last week.

OCCIDENTAL.—In the upper tunnel on the 48 level the south drift from the north incline winze was extended 10 feet; total length, 203 feet. In No. 3 east crosscut the station is completed and sinking begun. Extracted 12 tons of ore from the 100 level. On the 90 level, in the lower tunnel, the north drift from No. 2 upraise was extended 12 feet; total length, 181 feet. West crosscut No. 1 was advanced 15 feet; total length, 63 feet. East crosscut No. 3, 50 feet north of No. 2, was advanced eight feet. All of these openings are in quartz that gives low assays in gold and silver.

GOULD AND CURRY.—On the 425 level from the east crosscut, a drift has been advanced 10 feet. From the end of this drift a drift running in an easterly course was last week advanced 16 feet, passing a streak of milling ore. On the 300 level short drifts are still being run in various directions. The raise in the old stope is up 54 feet, showing a little milling ore. Repairs to the south compartments of the main shaft are still in progress.

OPHIR.—On the 1065 level west crosscut No. 1, from the south drift, was extended 30 feet. South drift, No. 2, started from this east crosscut No. 1, was advanced 28 feet. The ground passed through was of a favorable character, being a mixture of vein porphyry, quartz and clay, with a preponderance of quartz. This quartz is beginning to yield assays. The new winze (No. 1) below the track floor on the 1300 level is in promising material.

BALTIMORE.—On the 300 level, the main drift is progressing well, and has about reached the edge of the vein where the upraise will be started that is to tap the old 225 level. The raise will follow the course of the vein. On the 400 level, the old drifts are being cleaned out and put in shape for prospecting. There is much new ground to explore on this level.

BEST AND BELCHER.—On the 1500 level east crosscut No. 1 was advanced 75 feet; total length, 502 feet. It has entered soft porphyry. No. 2 was advanced 85 feet; total length, 458 feet. The formation is in vein porphyry, clay, and fine lines of quartz. During the past three days the amount of quartz has somewhat increased.

CROWN POINT.—Sufficient ore is being extracted to keep the mills in operation, and in the prospecting sections some new deposits are being shown up. The Mexican mill is working about 130 tons of ore a day right along. More ore could be extracted could milling facilities be obtained. Meantime ore is being opened out and put in shape for being taken out.

BELCHER.—Are still taking out 100 tons of ore a day. This keeps the Vivian and Santiago mills fully employed. A good deal of prospecting is being done and the force of men so employed are opening up some good deposits of ore. The force of miners is being gradually increased.

HAYWOOD.—This mine keeps the Briggs and Thompson mills fully employed. Could facilities for milling be obtained, an almost unlimited amount of paying ore might be extracted. A large deposit of excellent ore has been opened up in the east drift on the 200 level.

UTAH.—During the week the north drift from the main west drift was advanced 45 feet, and is now in 550 feet. The material is a mixture of quartz, clay and porphyry. The quartz is of a fine appearance, but assays are low.

YELLOW JACKET.—About the usual daily yield of 160 tons is being obtained. This is as much as the mills can work. Nearly all this comes from the 1300 and 1400 levels. Above these levels a large amount of prospecting is being done.

OVERMAN.—About the usual amount of ore is being extracted and deposited on the dump, where it is awaiting milling facilities, as the Belcher is now using the Vivian mill, where the ore was formerly worked.

HALE AND NORCROSS.—The connection between the main south drift on the 1300 level and the old incline gives a fine circulation of air. Crosscutting will soon be commenced at this point.

JUSTICE.—The prospecting drifts on the 250 and 310 levels are making good progress, and a considerable amount of ore that will pay for milling is being saved.

CHOLLAR.—At the Sharon shaft on the croppings a considerable amount of ore is being hoisted. Prospecting will soon be in order on the 1300 level.

SCORPION.—On the 300 level the east drift was advanced 32 feet. It is still in the usual vein material. The ground continues dry.

SAVAGE.—The usual yield of ore is being obtained from the 500 and 600 levels, and the prospecting sections are looking well.

VIVIAN.—The ore-producing sections are still showing well, and a considerable amount of ore is now on the dump.

Belmont District.

CHICAGO.—Belmont Courier, April 23: The Chicago M. & R. Co. concentrators are running constantly. The mine is looking well and the work of development is pushed vigorously. The mill is undergoing some repairs. On the 16th inst. the company made another shipment of nine bars of bullion, weighing 749 pounds, and valued at \$8548.36.

Aurora District.

THE SILVER LINING.—Walker Lake Bulletin, April 20: For some time the Silver Lining mine has shown itself to be one of the most promising properties in the county, and citizens of Aurora have felt that the camp would have a renewal of lively times, through the output of ore from the mine. The past was, however, only a hint of what is now, and what will be. A long delay in work was caused by the necessity of running a tunnel for the sake of more economic working. This tunnel was run along the ledge some distance under the old workings and in its progress developed an exceedingly fine ore body of great extent. Last week connection was made between the workings and everything will soon be ready for active operations. At the end of the tunnel, the ore is of a superior quality, and a winze, which, when last heard from, was down 12 feet, was in good ore all the way. Since the tunnel

began there has been in the present time a constant improvement, and the almost unexpected addition to their available ore assets is very gratifying to the managers. There is a large quantity of good ore in the old works, and the large deposit developed by the tunnel assures many dividends.

Bernice District.

A MILL.—*Cor. Renn Gazette*, April 22: The recent sale of Mr. G. W. Bothwell's mill property at Bernice, Churchill county, has brought new life and activity to a promising mining camp, which has, for two years, been somewhat hidden in obscurity. Mr. W. W. Williams, the purchaser of the mill property, is the individual owner of the Golden Crown mine and also the North Extension claim. Mr. Williams will take possession of the mill and other property which he has purchased of Mr. Bothwell, on or about the 25th inst. The Golden Crown mine has been extensively prospected since the time at which Mr. Williams ceased milling ore, which was nearly two years ago. The mill will start under the auspices of the late purchaser, on the first of May next, and we anticipate that the sound of ten stamps will continuously break upon the ears of delighted miners and old prospectors of Bernice and vicinity, inspiring renewed energy and interest in the coming mining camp of Churchill county.

Eureka District.

ORE SHIPMENTS.—*Eureka Sentinel*, April 24: During the past week ore shipments were made from the mines of the district to the Richmond works—Dunderberg mine, 59 tons; Silver Lick, 23 tons; White Pine, 3 tons. Eureka Co.—Margueretta mine, 1 ton; Lone Pine, 1½ tons; Geddes & Bertrand, 1 ton.

Hawthorne District.

WORKING AND PROSPECTING.—*Esmeralda News*, April 23: The lack of water supply has tended to retard thorough prospecting in Hawthorne district, and whenever prospectors combated this inconvenience, their efforts have been invariably rewarded by a handsome return. This district abounds in ledges showing flattering prospects, and no doubt this summer will not pass without adding an increased supply of gold to this county. The season is now opened with promising advantages, and the miners, prospectors, and residents are already exemplifying confidence in the mines of this district by working, prospecting, and supplying the wherewith to develop them. Frequently a nice lot of ore is extracted and shipped to reduction works, netting the owners adequate compensation for their time and trouble. The district, as yet, is not prospected to any extent.

A RICH STRIKE.—T. J. Brodigan and M. Carabantes, the fortunate owners of the Benus mine, near the Pamlico, created considerable stir on the streets by the exhibition of specimens of immensely rich gold ore from their mine. The specimens presented weigh 5 or 6 pounds each, and show that the ledge must be large and rich. The discovery of this rich ore has just been made, and Thursday morning Mr. B. sent his team out with provisions and tools to more thoroughly develop their new find.

ORE TO BE CRUSHED.—The Lapanta company is going to have 100 tons of Lapanta ore worked at the Moss mill, at Kinkaid. There is plenty of ore in the district which would be milled if a mill should be erected close to the mines, which, as a matter of course, will be done in time.

Northumberland District.

SHIPPING ORE.—*Belmont Courier*, April 23: The miners engaged in the development of Northumberland district feel confident that the mines of that locality will prove rich and valuable. They are still shipping their ore to Austin for reduction.

Philadelphia District.

LEDGE-WIDENING.—*Belmont Courier*, April 23: Judging from present indications, the Laity, in East Belmont, will soon be out of the "prospect" class, and will take place among the first-class mining properties of the district. The ledge is widening as the work of sinking progresses, and the ore is the richest ever uncovered in Philadelphia district.

Reese River District.

WORK TO BE PROSECUTED.—*Virginia Chronicle*, April 22: The work of developing the mines in the Manhattan group at Austin, Lander county, will be vigorously prosecuted the current year. The Toiyabe shaft will be sunk deeper and the new ground at a greater depth prospected for the downward continuance of the vein on the upper levels. The Frost shaft in the center of the group of mines, namely, the Oregon, Paxton, Curtis and North Star, having better facilities than any other shaft for the development of the network of ledges which have in former years yielded immense quantities of rich ruby and sulphurets, will be also sunk deeper and new ground unexplored prospected. The water in the Lander shaft below the 800 level will be pumped out in a few days, and it is the intention to sink the shaft and determine whether the ledges are not as rich deeper down as they have been nearer the surface.

San Antonio District.

PROSPECTED.—*Belmont Courier*, April 23: San Antonio mining district will be beard from as soon as the railroad runs through that section. Some of the mines are being prospected under the supervision of Asa B. Eastwood.

Tybo District.

MILL.—*Belmont Courier*, April 23: It is now thought that the Tybo mill will be in readiness to start up about the 1st of June.

Union District.

CINCINNATI COMPANY.—*Belmont Courier*, April 23: Work is prosecuted vigorously in all the mines in Union district, Western Nye, owned by the Cincinnati Co. Good ore is encountered and extracted daily, and the Knickerbocker mill is kept running constantly, crushing the ores from this district. Several bars of silver bullion were shipped last week. The owners are very much encouraged by the promising condition of the mines, and they will devote considerable of their attention to their development.

ARIZONA.

MOHAVE MINES.—*Miner*, April 23: From all reports there is a prospect of the consummation of 10 or 15 big mining trades in the next three months. During the past week the sampling works have run through two carloads of ore from the C. O. D. mine, besides several smaller lots from the various mines

in the neighborhood. T. L. Ayres has made a sale of the Union mine near Cerbat for \$40,000. The Union mine is one of the largest lead deposits in the county. Mr. Cockburn tells us that the branch sampling works at Prescott are starting in under very favorable auspices; that there are about seven carloads of ore stacked up at the works, and that ore is now coming in at the rate of 10 tons per day. The mill building is about completed and the machinery will be put in place in a few days. Ed. Cook and Hugh O'Donnell, who have a lease on the Flores mine at Cerbat, have opened up a body of gold ore for 100 feet in length, that will measure from 18 inches to four feet in width, and carries from \$40 to \$500 in the free-milling gold in Wallapai district. Thomas McMahon, who has taken a lease on the old workings of the Prince George south, after two days' work, has opened up 18 inches of the rich ore for which the mine is noted. George Bowers has just struck a body of sulphurets ore in the bottom of the main tunnel on the Gibraltar mine at Layne Springs. The tunnel is in 450 feet and he has been running over this rich ore body, as is shown by the recent development.

COLORADO.

ORE.—*Elk Mountain Pilot*, April 23: The Bullion King, at Irwin, is now moving some ore to market, the roads having become passable. They have considerable ore on the dump ready for shipment, and have a large body of splendid ore in the lower level. Supt. Koppel is in Denver. Work is still progressing on the Daisy group and with favorable result. The lessees of the Excelsior mine, in Poverty gulch, who have kept pegging away all the past winter, have opened a trail to the mine, and Ross' jack train is now engaged packing ore to the breaker. It is stated that Mr. Baker, formerly of the Volunteer mine, near Pitkin, has assumed the management of the Sylvanite mine and smelting works at Gothic, and that both will be put into operation as soon as the road to that town is in a passable condition. Work will be begun by the Lloyd Bros. on their Crystal river property some time the coming week. They have some splendid property.

IDAHO.

SALES OF MINING PROPERTY.—*Idaho Statesman*, April 21: The Idaho and California pioneer, Matthew Graham, while abroad effected a large sale of Idaho mining property to an English syndicate. This indicates that Graham has made a sale of a group of mines in the Silver mountain district, about 50 miles up the Boise river. Captain Nye also informs us that V. S. Anderson, of Hailey, who is now in London, telegraphs to his wife that the sale of the Atlanta property is sure. If these reports are true, there will be active operations in Silver mountain and Atlanta mining districts, and a wagon-road or a railroad will be built up the Boise river.

QUARTZBURG.—*Idaho City World*, April 23: Wm. Spaine, from Quartzburg, reports everything jogging along in the usual way. The new Gold Hill mill keeps up a constant pounding, as did the old mill of this company. A hydraulic chief arrived the other day for Wm. Barker. It will be used in the claim in Steamboat gulch, known as the Kingsley and McDonough ground. This claim has not been worked for three or four years. Barker will begin work this week.

WOOD RIVER.—*Hailey News-Miner*, April 20: It is reported that 12 feet of high-grade ore has lately been struck in the lowest level of the Minnie Moore, at Bradford. Twenty inches of ore are reported from the Japan mine. There is good indication of a large output from the mine this summer. There is a fine streak of ore in the Rebellion mine, below Bellevue. The ore vein in the Crossus mine has been cut by the tunnel, and the vein is now open to a depth of 270 feet below the surface.

DEER CREEK.—*Hailey Inter-Idaho*, April 22: Steve James, who has charge of the Montana and Snowfly mines on Deer Creek, came down last evening. He says the ore body in the Montana holds its own for extent and richness as work is pushed on the vein, and that it is destined to become one of the leading mines on Wood river. Also, that the Snowfly is improving at every stroke of the pick.

POTOSI GULCH.—On the Elza claim and the Neill fraction at the mouth of Potosi gulch, Frank Heller and eight men are working, ground-slucing on the bar and piping in the channel. They had one large pit nearly ready to be cleaned up about 10 days ago, when the rains fell and the floods came and got in their work at that pit and in the neighborhood thereof to such an extent that Frank and his partner write—\$1000 as the result of the jamboree of the elements. The ground is good. Above the Elza con., Hall & Co. are working rich ground from which they made a large cleanup Thursday. Above them still Shuster, Range & Co. are piping on a rich bar. They have done an immense amount of work and well merit the large cleanups which it seems probable they will get. Between the bar and the Galivan, Booth Ashman claims, there is a lot of ground which is known to be very rich, having been thoroughly prospected, but with which the owners can do nothing now, the water necessary for piping being controlled by the claims above. Galivan, Booth & Ashman have three full claims on which they have done a vast amount of work. A portion of the lower one is now used for a dump for a 20-inch bedrock flume 600 feet long. Eight men are working in two shifts, sluicing.

TRAIL GULCH.—*Coeur d'Alene Record*, April 20: Near the head of Trail gulch, Bremer, Stearns, Herder and Carr, owners of the old McCauley ground, comprising the Darnell claim and the claims formerly owned by Sullivan & Co., are ground-slucing a long, narrow strip where the bedrock is about eight feet below the surface. Below the above claim 12 men are at work on the rich ground of Nickerson Bros. & Co. They are using a penstock and are washing a rich channel pay streak 40 or 50 feet wide. Sterling & Co. on the upper part of the Horse Shoe are getting good pay. Near the mouth of Placer gulch Maboney & Co. are working rich ground. They have already made one of the largest cleanups of the season. The Miller claim is still flooded. On the Black Hills several men are employed getting things in readiness to begin paying operations as soon as water can be controlled. On the Montana Bar claim on the mountain, Dan McGrath is employing six men and has already piped off more gravel than was handled

all last season. The ground is known to be rich and the claim is likely to rank this season among the best producers in the mines.

NUGGET.—*Coeur d'Alene Record*, April 20: The largest nugget ever found in the Nickerson claim was picked out Wednesday. It is somewhat egg-shaped, weighs 18 ounces and contains possibly two ounces of quartz.

MONTANA.

DEER LODGE COUNTY.—*New Northwest*, April 22: Mr. William Hyde gives the following account of observations recently made in the mining camps near the northern boundary of Deer Lodge county. The Jay Gould mine is 30 miles northwest of Helena, near the head of Gould gulch, whence it takes its name, and is about 7000 feet above sea level. It was purchased last fall by Helena parties for \$75,000, and has been developed by a 350-foot shaft, and 600-foot drift run along the 350-foot level east and west. The lead shows a face at each end six feet wide of free-milling gold and silver ore, the metals being equally divided. A 900-foot tunnel is being run to tap the lead at the bottom of the shaft. It is now in half-way. A steam drill is used for boring it. A new 10-stamp mill was put up during the winter at the mouth of the tunnel, and from two cleanups made in February and March, they realized \$17,000 and \$19,000 respectively, besides some concentrates not included. The mill is from Frazer & Chalmers, with a Corliss engine sufficiently powerful to run 30 stamps, it being the intention to add additional stamps during the summer. There are two true vanners. About 80 men are employed. About half a mile below the Jay Gould mine, and on the south or opposite side of the gulch, B. Ackroy & Co. have struck a bonanza in a six-foot gold lead that prospects \$40 per ton, which they have named the Grabill. At Stemple, 12 men have taken out about 250 tons of gold ore from the Homestake lead, which is only from 6 to 12 inches wide. At Seven-up-Pete, on the west side of the main range, seven men wintered, developing quartz leads that are very promising, and 15 locations were made. The Silver Bell lead, on Poor Man, is being developed, and its extensions, called the Stewart, Comet and Humbug, show a vein of rich silver ore, seven feet four inches wide.

THE BUCKSKIN CO. will open their ground this season, which is distant but a few miles south of the Sheep Mountain country.

PROSPECTS.—*Anaconda Review*, April 22: The last week has been unfavorable to mining operations in this vicinity. The great trouble in the district just west of Anaconda is the snow which still lies very deep but a short distance up the valley. As the mines in the district are all in a very early stage of development and owned principally by men of very little capital, this difficulty is much more serious than it would be in an older camp. The big drifts are disappearing, however, and prospectors are beginning to venture out again. The Ontario mine is located on the eastern slope of Warm Spring Creek canyon, about 2½ miles from the Anaconda and Phillipsburg stage road. Reliable information says that this mine will be bonded within 10 days for \$10,000. The present owners are T. C. Davidson, C. E. Sawtelle and C. B. Caspar. The adjoining claim on the north is the Dead Fir, owned by George Kendall and Lee Rice. The Red Oxide has shipped three carloads of fluxing ore to the Butte Reduction Works. The owners are C. E. Sawtelle, C. E. Keenan, William Sharp and J. F. Todd. The class of ore found in this mine is copper carbonate, black and red oxide. The claim is situated about half a mile west of Oleson gulch on the Warm Spring creek slope. The Bung-Your-Eye gold claim, owned by George Gunn and William Seebree, is showing up a very good body of pay ore, sampling \$23 across the ledge. The Little Lester, owned by Church & Young, is looking well. The boys reached the 100-foot level yesterday and have begun drifting. They are taking out considerable pay ore. The next strike to be mentioned is the Flora Blanche, located by Malcolm McCav, which lies northeast of Sinclair's sawmill. This lead assays 28 ounces of silver and 22 per cent lead from the outcrop. A number of prospectors are expecting to move to the Lost Creek district at an early day.

AROUND VIRGINIA CITY.—*Cor. Butte Inter-Mountain*, April 15: Mining matters hereabouts have taken a tumble. Why this should be is beyond my understanding. Evidence undisputed is upon everybody's tongue that we have developed immense bodies of very rich ore but no one seems to want it. It is gold-bearing and there are thousands of tons of it in sight that runs all the way from \$24,000 to \$15 a ton. The lowest assays that I have ever heard of have not fallen below the last-named figure. Of course the high-grade ore above mentioned is somewhat scarce and expensive to work.

THE FLATHEAD COUNTRY.—*Butte Miner*, April 14: The gold excitement on Wolf creek, about 20 miles above the valley, will undoubtedly attract many to the place this year. Mr. Nelson saw some pretty good rock coming from different places adjacent to the valley, and thinks there is no doubt it contains some fine mineral. One party took out \$2000 of gold last fall, and they will resume operations when the snow disappears sufficiently for them to get in.

BUTTE NOTES.—*Inter-Mountain*, April 21: The Allie Brown is still producing very rich ore. The Josephine is producing a large quantity of ore. At the Cora, sinking has begun from the 250 to the 300-foot level. It is reported that Jacoby & Emigh, the lessees of the east extension of the Josephine, have struck it rich. Salt is being shipped to the Margat Ann mill and everything is being put in shape for the resumption of work next Monday.

NEW MEXICO.

LIXIVIATION.—*Black Range*, April 23: The test of 200 tons of Black range ores by the lixiviation process will begin at the mill about May 1st. This test is looked up to with no little interest by those who are interested in mines in northern Sierra county, as the immediate revival and growth of our mining industry depend upon the success of our lixiviation works, which, however, have every evidence of being faithful to the purpose for which they were intended.

BORNITE ORE has been discovered in the King

mine adjoining the Homestake near Hermosa. This discovery of bornite is the first in the Palomas mining district. The owners of the King, Messrs. Wulford, Davison & Dalglish, are pushing development work on this property and are now down over 30 feet and have an excellent showing of ore. The King promises to develop into value as great as the Homestake, as every foot of work done adds to its appearance and worth. Mining was never more active than at present in this district, every one feeling confident that a bright and prosperous future is immediately in store for us. This district (Apache) with her plentiful showing of mineral confined within true fissure veins, when once developed will astonish the world.

OREGON.

PLACER AND QUARTZ.—*Jacksonville Times*, April 22: Arnett Bros. have struck very rich diggings on Briggs creek, Josephine county. The recent rains have done much to keep up the water supply, which was failing fast. Cornelius & Co.'s quartz-mill started up not long since, but the pump broke this week, causing more delay. The gulch in Galice Creek mining district which Ennis & Cameron have rented to Chinese is turning out very rich. We learn that some very rich pockets of gold-bearing quartz have been found in McDonough & Kahler's ledge near Fort Lane. A test of some ore from the Green Mountain ledge was made recently, and the result proved highly satisfactory. E. K. Anderson is making a big run at the '49 diggings in Eden precinct. There has been a large supply of water and prospects are good. A correspondent of the *Times* writes that most of the miners of Evans and Pleasant creeks are cleaning up. They had a good run and have done pretty well. Wm. Bleckert, of Gall's creek, is doing well this season. He lately picked up some handsome pieces of gold, one of which weighed \$7 and the other \$14. H. C. Martin, of Galesville, has taken another contract of delivering ten tons of quartz from the Green Mountain ledge at the depot at Glendale, which will be shipped to East Portland for reduction at once. The Jacksonville Milling and Mining Co. held a meeting last Monday evening, and concluded to continue prospecting their claims on Timber gulch. There is much activity in Grave Creek mining district, Josephine county, where some quartz ledges are being prospected by the St. Peter's Mining Co., for which E. S. Smith is expert. The results so far have been quite promising. It is said that the company that has been prospecting Green Bros.' ledge in Galice Creek district intends resuming work in the near future. Another tunnel will be run, as the ledge was not reached by that dug last year.

SILVER CREEK.—*Cor. Bedrock Democrat*, April 23: Located just over the mountain, about 25 miles westward from Baker City, and in a broad and beautiful forest-covered cove, surrounded by lofty, precipitous peaks of the Blue mountain range, is the young and promising gold and silver quartz mining camp of Silver creek. Situated as it is, convenient to the railroad over an almost level wagon road, with all the facilities combined and near at hand for mining and the reduction of its ore, and in the very heart of a civilized and enterprising community, lying dormant and unnoticed as it has been in the past, is something that astonishes the old quartz miners who are being attracted here from other regions of the mining world. A more regular and unbroken system of true fissure veins never existed in old Mother Earth than can be seen along the course of this broad and extensive mineral belt. One of these many veins which find their way across the cove is enough in itself to support a large and thriving camp of a few thousand population. For five miles along its course it shows an outcrop of from 20 to 200 feet in width, with numerous seams of high-grade ore, some of them two feet wide—which occasionally unite and form large ore bodies—and so continue along the whole distance of the lode as far as it has been discovered. Another parallel vein but a few hundred feet from the above, and known as the California, is sufficiently developed to produce at the least 100 tons of ore daily, which will average about \$50 per ton. A sorted lot of this ore shipped to San Francisco, yielded \$350 per ton. This, and three other similar mines adjoining each other, have just been bonded for the small sum of \$57,000.

UTAH.

REVIEW.—*Salt Lake Tribune*, April 22: The receipts in this city for the week ending the 20th inst., inclusive, were \$95,643.07, of which \$46,381.46 was bullion and \$49,261.61 was ore. For the previous week the receipts were \$81,697.52 in bullion and \$53,780.11 in ore, a total of \$135,477.64. The Ontario output for the week was 41 bars of bullion, 26,076.17 fine ounces; no shipments of ore. The Daly product during the week was 13 bars of bullion, 18,110.83 fine ounces; no sales of ore. The fine bar receipts of the week were to the value of \$20,966.45; dore bars, \$4000. The Hanauer smelter produced for the week, bullion to the value of \$17,915.

PARK NOTES.—*Record*, April 23: Last Sunday the Mackintosh sampler started to work on Ontario ore with the new sampling machine, which Mr. Mackintosh bought in Denver, with the patent right. It works like a charm and is the best thing yet for accurately sampling ore. Ross-camp & Glenn, the veteran prospectors, report a valuable strike in their group, northwest of the Crescent. The vein encountered averages two feet in width, and assays from it go about 80 ounces silver. The new rate on ore from Park City to Kansas City is \$11 per ton; to Omaha and Council Bluffs, \$10; Denver, \$7; and to Ogden or Salt Lake City, \$4 per ton in carload lots. More unjust discrimination this is. The Crescent tramway is being cleared, cars repaired, and other preparations to resume ore hauling within a short time.

ORE AND BULLION SHIPMENTS.—The Mackintosh sampler received during the week 439,700 pounds of Ontario ore. The Daly will ship ore again very soon. During the week the Crescent shipped 212,000 pounds of concentrates, but no first-class ore. On the 17th inst, the Ontario shipped 41 bars of bullion, containing 23,468 fine ounces of silver. The Marsac mill shipped last Sunday six Daly bars, of 6760 fine ounces. On the 21st, Thursday, the product was six bars, containing 7255 fine silver ounces, and to-morrow or Monday another average shipment of Daly silver bullion will be made.

—IMPROVED—
**James Patent Economic Quartz Mill,
 ROCK BREAKER**

Sectional View of Pulverizer.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

361,532.—MITER-BEVEL—L. H. Lewis, San Jose, Cal.
361,367.—TREATING NIGHT-SOIL—R. W. E. Mac Ivor, Sydney, New South Wales.
361,473.—LASTING MACHINE—S. N. Washburn, Union, Oregon.
361,663.—ELECTRIC ARC LAMP—G. A. Wiese, S. F.
361,341.—VELOCIPEDE MOTOR—J. Witt, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court Department 10, San Francisco:

SEGREGATED WASHOE M. Co. April 27. Location, Nev. Capital stock, \$10,000,000. Directors—M. L. Reynolds, W. G. Edwards, P. S. Dorney, J. H. Maboney, Theodore C. Metzler.

SOUTHERN CALIFORNIA COAL AND CLAY Co. April 25. Object, to engage in mining and selling coal and clay, and to engage in the manufacture of terra-cotta pipe brick and other articles. Capital stock, \$100,000. Directors—John D. Huff, John Dolbeer, George D. Gray, William J. Mcgean, E. L. Allen.

MIDDLE FORK M. Co. April 27. Location, California. Capital stock, \$1,000,000. Directors—George C. Perkins, Thomas Price, Arthur F. Price, F. W. Sumner, R. H. Lloyd.

PERFECT COMBUSTION Co. April 27. Principal place of business, Oakland, Alameda Co. Object, to own, buy, and sell United States and foreign letters patent for all kinds of inventions for saving fuel and smoke burning; to grant or license others under any such patents, the right to make, use, or sell the same; also to manufacture, use and sell throughout the United States or elsewhere; to own, buy and sell real estate; to mine, merchandise or do a transportation business, or any other act or acts necessary to carry out the foregoing. Capital stock, \$100,000 in 10,000 shares. Directors—John H. Hobart, T. J. Pearce, J. G. Pearce, H. Laperle and D. D. Cook.

Mining Share Market.

Some little improvement was shown in the mining share market during the week. Up on the Comstock, matters are looking more lively. The new water-mills will help that section out largely. There is a rumor here that J. C. Flood has disposed of his Comstock interests, but it has not been confirmed.

In the Potosi and Chollar are large quantities of ore that are awaiting milling facilities. Once this ore is hoisted out and sent to the mill, there will be a demand for additional forces of miners.

At the Consolidated California and Virginia mines, carbonic acid gas is still being injected at the rate of 40,000 cubic feet a day, and it is believed with effect. The best evidence there is that the gas is going to where it is most wanted is that it is not coming out at the Consolidated Virginia, where the gas, which is the product of the combustion going on among the old timbers, is escaping.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Bluebird, April 20, \$17,474; Chicago, 20, \$8548; Lexington, 22, \$31,824; Alice, 22, \$27,728; Moulton, 22, \$12,640; Bluebird, 22, \$35,648; Manhattan, 20, \$13,008; Con. California & Virginia, 20, \$9,599; Bluebird, 19, \$19,308; Hanauer, 20, \$1580; Bannock, 20, \$3500; Hanauer, 21, \$1580; Bannock, 22, \$1700; Hanauer, 22, \$2250; 23, \$6573; Crescent, 24, \$3350; Bannock, 24, \$1800; Hanauer, 24, \$4750. Last week's outward mineral shipments from Salt Lake were: 21 cars bullion, \$28,206 pounds; 101 cars silver and lead ores, 2,979,780 pounds; 16 cars copper ore, 439,100 pounds; total, 138 cars, 3,947,086 pounds.

To Every Pump Maker, Owner! Runner! Agent!

If there is any PRACTICAL QUESTION concerning ANY APPLICATION or any ADJUSTMENT of ANY KIND of a PUMP which is not answered in Mr. ROBERT GRIMSHAW'S PUMP CATECHISM, we would like to have it for answer in the next edition or volume.

The Author will answer any such question in our columns, if addressed in our care, by a regular mail subscriber to our paper. "Catch" questions invited, if they have a practical bearing.

Tells, for instance, how to put entirely together, set up, adjust, and run all the leading pumps in the market. This information can be had in no other shape or place. Price of the book, post-paid, only \$1, and worth \$5.

DEWEY & CO.,
220 Market St., S. F.

THE Butte Record says: Louis Glass, for many years superintendent of the big hydraulic mine at Cherokee, but not now connected with it, has, it is said, been engaged to take charge of an extensive enterprise on the Island of Borneo, and will next fall go there to take up his abode.

Steam Engine Catechism.

A SERIES OF DIRECT PRACTICAL ANSWERS TO DIRECT PRACTICAL QUESTIONS—MAINLY INTENDED FOR YOUNG ENGINEERS AND FOR EXAMINATION QUESTIONS.

—BY—
ROBERT GRIMSHAW, M. E.

This book is intended to answer not only "such direct questions as have been asked by both theoretical and practical men," but "questions chosen with the view of saving the reader a long search after some point, and enabling him to get directly at the information desired." Formulas and mathematical gymnastics are avoided. While the book is not written for professional men, it is technically correct and up to date. Published in two parts. Price of each part, \$1, postpaid.

Part II of the STEAM ENGINE CATECHISM contains answers to further practical inquiries received since the issue of the first volume. Sold by

DEWEY & CO.,
220 Market St., S. F.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

TESTIMONIAL.

OFFICE OF THE EUREKA ELECTRIC LIGHT CO.,
EUREKA, CAL., Feb. 15, 1887.

San Francisco Tool Co., San Francisco, Cal.—GENTLEMEN: In answer to yours of Feb. 8, 1887, would say: The four engines purchased from your Company in January, 1886, have been running continuously ever since, from 12 to 16 hours each day, not excepting Sundays, and have never given any trouble; and, furthermore, they have never cost us anything for repairs. I consider them fully as economical as our slide-valve engines, which we are using. One of them is a balanced valve, Haekins' make, and the other is the New York Safety Power Company's make. The relation to the cost of keeping your Single-Acting Engine in repair to the cost of keeping the Slide-Valve Engines which we purchased the same month we purchased your engines, and working under the same conditions, is, that while there has been no expense in either material or labor on the engines furnished by your Company, the expense of keeping the Slide Valve Engines in good running order has cost, on an average, \$8 to \$12 per month for each engine.

A portion of the time the Single-Acting Engines have been run by the fireman, and I can recommend your engines to parties that are not close to a machine shop, and do not want to keep an engineer and fireman, as with your engine all the attention they require is to fill the oil cups once every 16 hours, and turn the steam on and shut it off. The balance of the time the engine takes care of itself. Yours truly,

A. A. OSBORN, Superintendent.

SINGLE-ACTING ENGINE.

SILVER-PLATED AMALGAMATING PLATES
FOR SAVING GOLD

—IN—
QUARTZ AND PLACER MINING.

The Most Extensive and Only Successful Manufacturer of these Plates on the Pacific Coast.

OVER 3000 ORDERS FILLED!

Only Refined Silver and Lake Superior Copper used. Weight Guaranteed.

Old Mining Plates Bought, Replated or Gold Separated.

Awarded every Medal for Silver Plated Mining Plates on the Pacific Coast for the last 15 years.

These Plates can also be purchased of **JOHN TAYLOR & CO.,** Dealers in Assayers' and Mining Material, 112 to 118 Pine St., S. F.

NOTICE.—My Silver-Plated Plates are well known, and in use everywhere. They still continue to assay at least one-quarter more silver for the same money than any plates made here. One trial of my plates in competition will prove this. Light, thin silver-plating looks the same as heavy, but has no durability.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearings, cogs or pulleys.

Power applied direct. Works Ore at Low Cost More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

WM. GUTENBERGER.

Sacramento Foundry, Cor. N and Front Sts., SACRAMENTO, CAL.

DEWEY & CO., { No. 250 MARKET ST. } PATENT AGENTS.

Elevator 12 Front St.

BROCK'S PATENT DROP FORGED CHAIN PIPE WRENCH

MADE ENTIRELY OF BAR STEEL. Six Sizes; adapted for Pipe from 1/2 to 14 inches diameter.

Each number will fit a range of sizes equal to six or more pairs of common tongs, while it will outwear an equal number of any kind.
 All parts are interchangeable, and can be readily renewed.

Jaws are hardened to a saw temper, and can be sharpened with a file.
 Does not crush pipe; has a quick grip; never slips; chain will not unhitch while in use, but can be instantly released.

New Metallurgical Apparatus.

Joshua E. Clayton and Simon F. Mackie, of Salt Lake, Utah, have recently invented some improvements in metallurgical apparatus, consisting of a roasting or heating furnace of suitable construction, with a containing vessel or chamber supplied with suitable tuyeres, for the purpose of introducing into the contained mass of material, air, steam, or other gas or vapors, at such pressure as will suffice to enable them to boil or be blown through said mass.

The mechanism designed by the inventors we give in the accompanying engravings, but it is manifest that numerous modifications are possible. In the engravings Fig. 1 is a side view; Fig. 2 is a transverse section on the line VV, Fig. 1; Fig. 3 is a transverse section on the line WW, Fig. 1; Fig. 4 is a partial horizontal section on the line XX, Fig. 1.

A is the fire-hox end or mouth of an ordinary rotating or other furnace, which discharges into a chamber, B, covering the hopper or receiving-chamber C. This hopper C is formed of three truncated conical portions. One inverted truncated cone, D, catches the roast as it comes from the mouth A of the rotator and delivers it into the truncated conical portion E, whence it passes into the lower vortical truncated portion, F. As figured, the conical portions D and E are of brickwork, and are built upon a deck-plate, G, covering a well or hole. In the well or hole is hung (by four T-bolts, H, taking into lugs I in the deck-plate G) the casing K, whose upper part is lined with fire-clay or other suitable material, while the lower part is shaped so as to form a water-jacket, L.

In the receiving-chamber C are introduced tuyeres for allowing air, gas, or vapor to be blown into the mass in the hopper. These tuyeres M (16 in number) are figured as holes radiating from the lower portion of the cone N, which is supplied with air, etc., by the pipe O, which connects with the three radial pipes P, resting upon the casting K. These pipes P are connected with suitable air-pipes, stop-valves, etc., which, to avoid complication, are only partially indicated in the drawings. The lower portion of the casting K rests upon the box of the discharge-wheel Q, which is keyed on the axle R, this being furnished with a pulley, S, for regulating the discharge. The discharge-gear is of a well-known type, and there are many alternative gears which can be substituted for it. It empties into the hopper T. Opening into the chamber B is the fire-hox U, the products of combustion from which pass over the bridge a through the arch b into the chamber E. The opening from the fire-hox U under the arch b into the chamber B can be closed by the damper c.

From the fire-hox, U, there is an opening, d, leading into the stack or chimney, e, and closable at pleasure by the damper, f. The side of the fire-hox, U, contains a superheater, g, which is furnished with inlet and discharge-pipes, h and i, attaching to suitable connecting-pipes, stop-valves, etc. Under the bridge, a, and discharging into the upper part of the inverted truncated conical portion, D, of the receiving-chamber, C, are pipes, j, which connect with a main, k, furnished with suitable connecting-pipes and stop-valves. In the upper part of the chamber, B, are holes, l, which can be closed by fire-bricks, plugs, valves or dampers.

In employing this apparatus they charge,

CLAYTON AND MACKIE'S NEW METALLURGICAL APPARATUS.

through the ordinary forms of feeding-gear, the pulp, ore, or substance to be treated, into the rotator, and this being put into rota-

tion the pulp, ore, or substance passes down through it, and coming into contact with the flame from the fire-box U or other warm gases

and vapors generated, is heated or roasted to any desired extent, and in such condition empties from the mouth A of the rotator into the receiving-chamber C. When the chamber C is sufficiently full of pulp or roast, air or steam or any desirable gas or vapor at a suitable pressure is let into the pipes P and passes into the cone N, where it is slightly heated by contact with the walls, which are surrounded by hot roast or pulp, and thence through the tuyeres M into the chamber, bubbling or boiling up through the material contained therein, until it escapes into the chamber B, whence it passes out through the rotator.

The air, steam, or gas, when it leaves the chamber B, has the same temperature as the hot pulp, roast, or material in the chamber, and in its passage through the rotator imparts its heat to the cooler material which is fed into it. The discharge-wheel Q, being put in motion as soon as the chamber is sufficiently full, draws off the roast or pulp from the chamber continuously, so that by regulating the feed and discharge the level of the roast or pulp is maintained at any desired height in the chamber.

The dampers, f and c, admit of regulating the amount of flame which passes into the rotator, and the heat therein is thus controlled independently of any regulation of the fire.

If it be desirable to use a deep fire in the fire-hox, U, and for this reason sufficient air does not pass through the grate-bars for the proper combustion of the gases generated, the air necessary for combustion is supplied to the flame by opening wholly or partially the holes l in the upper part of the chamber, B, allowing the air to fall into and descend through the hotter and lighter flame.

The supply of air for oxidizing or roasting in the rotator, or for burning any inflammable products which may be generated in the converter, is introduced under the flame from the fire-hox, U, through the main k and pipes j, and being cooler and heavier than the flame, tends to remain below it in contact with the roast or pulp in the chamber and rotator, and burn or oxidize the escaping gas, pulp, or roast.

By making suitable pipe connections with the discharge-pipes of the superheater, those using the apparatus can pass through the superheater and heat, either blast which is introduced into the cone, N, and thence out through the tuyeres, M, into the chamber, C, or the current of air which passes through the main, k, and discharge-pipes, j, over the mass in the chamber into the rotator, or even the air supplied through the holes, l, in the chamber, B, for the combustion of the flame in the rotator; and by using more than one superheater they can heat more than one of these blasts or currents. Lastly, if they choose, they can use the pipes, P and k, to introduce into the chamber or rotator gases other than air; or, by using more than one of the pipes, P, and employing one to introduce one gas or vapor, while the other introduces a different gas or vapor, they can blow into the chamber any desired mixture of gases or vapors. The skilled metallurgist would at once see that such a form of apparatus could be advantageously used for a great variety of metallurgical operations not necessary to be mentioned here; hence it will be apparent that the converter may in some cases not only suffice to accomplish a desired chemical reaction, but also become a generator of heat which could be utilized in the rotator.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Letter From a Miner.

EDITORS PRESS.—I am one of those unfortunate hydraulic miners, and have been enjoined from further working my mine either by the hydraulic or any other process, by orders from Judge Keyser's Court, therefore my occupation is gone. I don't know what to do, but think I will have to emigrate, for I cannot make a living here unless I can work my mine. I have worked in the gold mines of California more than 30 years; have made a good deal of money and lost it again; I have expended more than \$10,000 within the last eight years in improvements. I have now got my mine in a condition that I can get it all back again, and more with it, if I am allowed to work it. I am working in the bed of a creek with a hydraulic elevator, elevating all the material and dumping it on higher ground, where it is out of the way of freshets or high water. I am putting no foreign material into the creek, but I am enjoined all the same. All of the principal mines of Plumas county have been enjoined also. It is the greatest outrage that has ever been perpetrated on a free people, for it cannot be shown that the debris from the mines of Plumas county has ever done the valley a particle of harm. The fact is there is nothing that ever reaches the valley but discolored water, but there is now a clamoring for clear water. There is an attempt to make us out a lot of bandits and outlaws and even felons, but that point would not go down with the last Legislature. If we are not pursuing a legitimate calling why don't the general Government step in and stop it? But if we are, why don't they give us the same protection that every other class of citizens has? The time was when miners were all powerful in this State, but it is changed now and the Grangers can out vote them.

S. S. T.

Spanish Ranch, Cal., April 22, 1887.

Gold in California.

(Continued from our last.)

[Translated for the MINING AND SCIENTIFIC PRESS from *El Minero Mexicano*.]

An American, John Hoppe, went in 1850 from the Atlantic to the Pacific Coast, and settled near one of the cascades of the Sierra Nevada, with three companions, to fell timber. They set up their tents and proceeded to accumulate wood for the winter of that year. One day when John was digging, the pick-ax found and extracted a fragment of virgin gold from a whitish and hard earth, which revealed the nearness of an auriferous ore deposit or criadero. According to a

Report of Hon. T. Butler King.

Made in 1850 to the Government of the United States, by which he was commissioned, the auriferous region includes a surface 500 miles in length by 50 in width, its zone situated in a direction parallel to the Sierra Nevada. It contains within its limits the series of hills and cordilleras which rise on the east above the plains of the Sacramento and San Joaquin, following that direction 60 miles, terminating in the highest part of the Sierra Nevada at an altitude of 1219 meters above the level of the Pacific. From the slope of the Sierra issue a

Number of Streams.

Which increase their wealth with the rains and melted snow in their progress to the Sacramento and San Joaquin rivers. These rivers and all these rivulets have shown gold in their sands. The rocks which predominate most in the geological construction of these hills are talcose-slates and chlorites, traversed by veins of quartz presenting a green appearance. The general direction of the strata is from east to north, with a strong inclination toward the north. The eruptive rocks which have upturned these lands are, it appears, the diorites and the porphyry diorites, the land having an identity with that of the Ural mountains. The geologists who have visited one of these lands identify it with the other. Both localities are opposite, in a similar meridian, and in the northern hemisphere. Two lands, the most classical and the highest! In both countries, great contrasts of temperature are experienced, varying from snow to rains, excessive heat and dryness, especially that part of California near the coast. All these circumstances, which damage so much the animal constitution, are precisely those which most favor the decomposition of the rocks and those which occasion the auriferous deposits in the bottom of the valleys by the carriage of the detritus and disintegrations.

The Criaderos of Alta California

Are like all the auriferous deposits that we have observed—modern alluvions—very rich, containing gold in stones of quartz and some loose kernels in sands or placers, as much in the ancient rivers as in the modern; very abundant in pepitas and small grains of metal, and from whose sands is obtained by washing, a dust, the finest of gold; and lastly, veins or threads of auriferous quartz, which, when in proximity to the surface of the land, recompense amply the labors of the miner, but not, however, if they penetrate to a certain depth. The quantity of gold collected from its primitive date is impossible to calculate. The production has depended on the

number of persons engaged in digging, washing, and manipulating it, and as the placers were abundant and the veins rich, the thousands of laborers who have gathered to them have found gold, and at last they appear as if exhausted. If the United States contain immense wealth distributed among many persons, among whom are found more millionaires than in other nations of the world, California, like England in Europe, is the one which has the most. The criaderos of Siberia will be more durable because they belong to the Government and are exploited moderately; for this reason they seem to be of great richness. In the auriferous criaderos of California it has happened, as in other countries, that the exploitation has fallen principally upon the alluvions and veins, or eruptive quartzose dykes. The alluvions originate from the separation of the auriferous quartzose veins, says M. Simonin, and sometimes from the decomposition of granitic or other rocks which contain the injected gold. The principal dyke is that which, appearing in Monte Ophir, in the county of Mariposa, reappears again at Jamestown, in the county of Tuolumne, and from there as far as Jackson, in the county of Amador, having an extent of nearly 145 kilometers in direction of northwest to southeast, following a mean inclination of 60° northeast. This dyke is generally in concordant stratification between the hojillas or small leaves of the ancient slates. Its thickness varies from one to 25 meters. The third part of its length separates from the Monte Ophir and river below the town of Coulterville, and is divided into two branches which reunite themselves afterward on the height of the Pena Blanca.

The Most Important Branch

Follows in concordant stratification with the slates; but the other branch cuts them to separate itself from the first, although they again unite. The maximum separation is about two kilometers, and the total length of each branch is nearly 16 kilometers. The principal branch, which performs the office of vein-crozier (veta cruzadora), has cut in the Mary Harrison mine a vein of quartz, which has a direction from north to south, according to "Barron." In support of his opinion upon the eruptive origin of the quartzose criadero, M. Simonin cites the two following facts: 1. In some points of the height, the quartz is polished and washed as by violent mechanical friction. The streaks are parallel and are in the inclination of the criadero. Sometimes they are also in a direction diagonal to this inclination; they form upon the pieces of quartz in which they appear an impression particularly analogous to that of the calamites upon the carboniferous slates. 2. In the Mary Harrison mine a rebosadero or dissemination of chlorite and steatite has appeared at the same time as the quartz, and this chlorite is as lustrous and brilliant as a mirror in the alto of the vein; besides, the gold which it contains, frequently abundant, is in general, scattered in hojillas or small leaves outspread, and as polished as in a laminador.

M. C. Beaumont remarks that the description of M. Simonin, relative to the polishing and streaking of the quartz of the alto, adapts itself with admirable precision to certain specimens of the auriferous quartz vein de la Gardette (Isere), which the School of Mines possesses. And yet, M. C. Beaumont doubts much whether the vein, de la Gardette, has an eruptive origin properly speaking. Besides the veins that M. Simonin believes eruptive, he has recognized others called contact veins, arranged between the serpentines and the elevated slates.

Gold is Generally Found

Scattered in small crystals isolated or grouped sometimes in alambres, or in thin plates, and sometimes in bolsas or hollows. The medium richness of the quartz in the mines exploited is \$20, or 100 francs per ton. The gold contains from 4 or 5 to 20 per cent per 100 of allied silver.

In regard to the alluvions, the gold which they contain is found in a native state in form of kernels or of needles.

Duprenoy reports that the auriferous cuenca or earthen bowl of California extends from the Sierra Nevada to the Pacific; that it includes all the valley of the Sacramento, which has its birth in the mountains and submerges itself in the ocean in the harbor of San Francisco. The valley of the San Joaquin, which unites with that of the Sacramento making the parallel 38°, and the lengthened-out California mountains, complete this vast auriferous basin. The mountains which limit this valley and link together all its coasts, exhibit the ancient rocks at their base covered with a compact calx, quite modern, and crowned on many of their points by lands not often tranquil. The veins of gold which by their destruction have produced the richest alluvion of California, are found near the limit of the ancient rocks and of the calx that we have indicated. Their matrix is of quartz; many of them appear to have been objects of exploitation in times far distant.

All the Small Valleys

which unite with that of the Sacramento are auriferous. The exploitations are on the richest placers of the borders of the American river, and in the valleys of the Bear, the Yuba, the Feather and the Three Buttes. The placers of the San Joaquin are less rich than those which group themselves around the valley of the Sacramento. There are, however, some important ones in the valley of the Mariposa, which river is one of the affluents of the San Joaquin.

(To be Continued.)

Medical Advice to Prospectors.

To Keep Healthy in Hot Climates.

Dr. J. A. Nealon, late medical officer to the Akankoo Gold Coast Mining Co., writes a letter to the London *Mining Journal* concerning the means which should be adopted to keep in health on the west coast of Africa. Some of the advice given is applicable to other hot countries, and we print the letter referred to for the benefit of prospectors and miners: Very few indeed know how to adapt themselves to the circumstances of a tropical climate, and to this fact I believe a good deal of the illness and many of the deaths occurring, especially on the west coast of Africa, are due. Most Anglo-Africans bring with them the idea that the climate is exhausting, and that they must make up for loss of energy by eating. They eat more meat and a greater number of times than they do in England. At home the working man has to be content in the majority of cases with one meat meal daily. In Africa they must have three, because a company finds him in food. Three meat meals at home, with insufficient exercise, would soon produce deleterious effects, yet men expect to do the same in Africa, and with impunity. I have no hesitation in saying that most of the cases of fever I have seen were due to excessive meat eating, and to wilful and deceitful disobedience of medical orders. With regard to alcohol I have not seen its use in moderation attended with any evil results. Of total abstinence I cannot speak, as I have never known a total abstainer on the coast, either on board ship or in any of the mines. As to the particular kind of alcohol, most medical men with coast experience agree that good whisky, well diluted, is the safest and best. Claret for working men I strongly object to. All cheap clarets are very acid, and taken in quantity soon impair digestion. Lager beer is preferable if alcohol is to be given. The objection to withholding alcohol *in toto* is that men will then secretly buy trade gin and get drunk on it, as I have known them do more than once. On the abuse of alcohol it is unnecessary to dwell. The fact that three-fourths of the deaths on the coast are due directly or indirectly to it, speaks for itself. When traveling, especially over land and on foot, cold tea is the best drink to quench the thirst, which must of necessity arise. Alcohol in such cases only intensifies the thirst, and requires frequent repetition if once used. Europeans newly arrived in malarious countries are more susceptible to malaria than those longer resident. At the same time it must be borne in mind that no length of residence on the west coast will give a complete immunity from fevers, though it may lessen the attacks both in frequency and intensity. Bearing this in mind, old coasters as well as new will do well to adopt ordinary precautions, of which the following are the most important:

- 1.—Avoid undue exposure in the early morning while the fog still hangs on the ground, during the heat of the day, and after sunset when the dew begins to fall. A light repast (biscuit and tea or coffee) should be taken first thing after rising, and before leaving the house.
- 2.—Avoid getting chilled by standing or sitting for any length of time when the body is unduly heated, or by neglecting to change underclothing as soon as possible after profuse sweating.
- 3.—The use of strong purgatives is especially to be avoided; they weaken a constitution already enfeebled by tropical residence, and may bring on dysentery. At the same time, it is essential to secure a daily motion from the bowels, naturally if possible, by saline laxatives, such as Euc's fruit salts, pyretic saline, etc., if need be. Diarrhea, if persistent and painful, should at once be attended to by a change to a lighter diet and the administration of 30 drops of chlorodyne, to be repeated in a couple of hours if necessary.
- 4.—When fever comes on there is no use trying to fight against it, or work it off; by not laying up in time the attack is invariably severe in its course and longer in duration, and convalescence is retarded. Much valuable time is thereby lost which might easily have been avoided. Besides, it must be remembered that what would otherwise be a light attack may, if neglected, will end fatally, while the severest attack, judiciously treated, will end in recovery.
- 5.—Where practicable, a plunge bath should be taken every day after work, and the whole body carefully scrubbed. At home cleanliness is one of the first laws of health; in the tropics where the pores of the skin become so readily occluded from dried-up secretions, daily ablutions are imperative.
- 6.—When the premonitory symptoms which usually precede the onset of fever are felt, the patient should immediately go indoors for the remainder of the day, and take 10 grains of quinine every two hours until three doses have been taken, if no effects (noises in the ears, etc.) have been previously felt. A podophyllin pill followed after some hours by a saline draught or the latter alone will also be of advantage. If taken thus in time, and so treated—quinine, purgative, and light diet—most impending attacks will be averted.

If, however, as sometimes happens, the fever should come on, the patient should at once retire to bed, get well wrapped up in blankets, and get hot drinks (tea or coffee) to make him sweat. A purgative should also be taken if he has not already done so. After the sweating

ceases, and the temperature has gone down, which it usually does in five or six hours, 20 grains of quinine should be taken, to be followed in two hours by ten grains, if no effects have been produced by the first dose, and the ten-grain doses may be continued every two or three hours till effects are produced. Next day at the same time as the attack first manifested itself, the fever again returns, and the same treatment (minus the purgative if it has acted) has to be gone through. Returns may thus occur daily for four or five days. In all the cases I have seen the first return was the severest, subsequent ones getting less and less till the fever went off. Convalescence is usually quickly established, and the patient is able to resume his ordinary vocations, as a rule, the next day.

7.—The diet during an attack must be light—chicken broth, prepared soups, and arrowroot, with brandy and eggs in the more severe cases, where the patient shows sign of prostration. For vomiting, which is often a prominent symptom at the onset, I have never found anything effective; but when the excess of bile is got rid of it usually ceases of itself.

8.—If retching is continuous, and exhausting the patient, champagne alone or combined with soda-water given in small quantities (teaspoonfuls) frequently seems to answer best. To overcome the restlessness at night, which is nearly always present, and which if not relieved greatly exhausts the patient, an anodyne draught of chloral hydrate and bromide of potassium, 15 grains of each, dissolved in a wineglassful of water, should be given at bedtime even in the absence of a medical man; it should not be repeated, however, if it fails to have the desired effect, unless under medical supervision.

9.—As regards ordinary diet, three meals a day are quite sufficient; food should not be allowed in the intervals as is frequently done. The hours for meals best suited to working men are the hours they have been accustomed to at home. I have heard many complaints from men against tropical meal hours. It is not, however, always practicable to change the hours. The regimen they seem most in favor of was as follows: Breakfast, bread and butter with tea or coffee with or without meat; dinner, meat with fresh vegetables and fish, and if alcohol is allowed, a pint of bottle beer; supper, same as breakfast minus the meat.

Hardened Petroleum as a Fuel.

How it is Made and How Burned.

Efforts and experiments are constantly being made to utilize petroleum as a fuel. The Russians burn the waste after refining. Experiments in this country have generally been made with the natural product, just as it comes from the wells, in which condition it varies greatly in character and quality, and of course may require different conditions for being utilized as fuel.

But the most recent proposition is to reduce the natural oil to a solid substance and burn it after the manner of burning coal. This discovery comes to us from Russia. Dr. Kauffman, in his report to the Russian Government upon the matter, describes the manner in which it is converted into a solid and burned, as follows:

"Petroleum, which is a hydrocarbon of the so-called methane group, may be saponified just like the oils, fats, fatty acids and wax, thus oxidizing the oil and combining it with soda or potassa salts. For this purpose the oil is heated and from one to three per cent of its weight in common soap is added, with which it is boiled for about half an hour. After that time it will be noticed that the soap is all dissolved in the oil, and the fluid will suddenly turn into a hardened, putty-like substance, which will get as hard as stiff tallow when cold. This may be pressed into any shape desired. The substance is very hard to light and burns quite slowly, without making any smoke, with a reddish flame producing great heat and leaving about two per cent odorless, black and hard residuum. Compared with coal, it burns about three times slower, producing, if the draught be well regulated, about seven times more heat than anthracite coal. It could well be used in a stove specially constructed for the purpose, or in the old stoves if they are changed, which will not be very difficult. It is, therefore, very probable that petroleum will take the place of coal in many instances in the near future, which fact stove manufacturers will have to take into consideration."

Should these results be realized, solidified petroleum as a fuel may lay claim to the following decided advantages:

1. It is universal, abundant and cheap.
2. It may be pressed into any form desirable.
3. It burns slowly, without smoke, and produces great heat.
4. The fluid petroleum can be piped to the point where it is desired to solidify it at a less cost than coal can be carried on cars.

When the great Pennsylvania Railroad Company becomes interested in the subject, it is natural to look for early and tangible results.

THE Oregon Railway and Navigation Co. has leased its railroad to the Union Pacific. This change of management is said to give great satisfaction in Portland, as the O. R. & N. Co. has been regarded as very oppressive in its freight charges, and the U. P. is expected to pursue a more liberal policy.

The Mining Outlook in Amador County.

The outlook for the mining interests in Amador, says the *Ledger*, was never brighter than at the present time. There is a renewed activity all along the line. From Plymouth to Jackson, prospecting is being actively pushed ahead. The New London and Chicago mines near Plymouth continue to give every promise of turning out good paying properties. The addition of 40 stamps to the Pacific mill, which will give the Plymouth Consolidated mines a capacity of 160 stamps—probably the largest number of stamps operated by one company in the world—will soon be pounding out the gold from its native matrix. This wonderful mine, notwithstanding the steady drain upon its resources which has been going on for so many years, shows no signs of decay. The ore body is vast enough to give the 160 stamps, crushing over 300 tons of quartz per day, employment for an indefinite period. Should the New London and Chicago properties develop into gold-producers, Plymouth will become the liveliest if not the most populous mining town in the State.

The country between Plymouth and Amador is also showing up prosperously. The group of mines comprising the Loyal Lead, North California, North Gover, Potosi, Pennsylvania, Cosmopolitan and others, located near the Black Hills, or the region known as the lava beds, which has already yielded so handsomely in precious metal by superficial working, are generally believed to be in the center of as rich a portion of the mining belt as there is in the county. It is more than probable that all that is needed to develop rich and permanent mines in this district is the judicious expenditure of capital. The Loyal Lead, as far as its development has been pushed, shows up well. It looms up as one of the big mines of the future, and a number of other claims thereabout will undoubtedly respond to the expenditures of a little capital by opening up in an equally satisfactory manner.

Around Amador the outlook continues flattering. The famous Keystone moves on in its career of gold production as of old, and the South Spring Hill, the young giant of the county, is as strong as ever. The Original Amador is taking on a new lease of life, after lying dormant for a number of years.

The resumption of work on this Wildman is not unlikely to restore Sutter Creek to its old-time prosperity.

Around Jackson everything wears a prosperous aspect. The Kennedy is evidently destined for a long life of gold production. It has now passed through the experimental stage and may safely be ranked among the steady mines of this section. The last cleanup, it is freely reported, was very satisfactory. The ore is low grade, probably not yielding more than \$5 per ton in free gold, but this yield will leave a fair margin for profit. The Zeile is looking as well as usual. This is perhaps the lowest grade of rock worked in the county, but the mine pays running expenses, if it does not put dividends into the pockets of its owners.

Altogether there are nearly 500 stamps in operation in the county. Taking two tons as the average daily capacity, this would give 1000 tons of quartz crushed every 24 hours. This is a greater number of stamps in activity than Amador county has ever witnessed in her history. Taking \$6 as the average yield per ton of quartz, we have a monthly output of \$180,000, or \$2,160,000 per year, which is probably not far from the truth as regards the ratio of our contribution to the world's supply of gold. And basing our judgment on present prospects, the outlook is favorable for the output increasing rather than diminishing for many years to come.

A PENNSYLVANIA COMPANY has received a contract for the manufacture of 1,000,000 blocks of slag for paving purposes. This is a good way to utilize slag.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RIVET.—Matthew Arnold, S. F. No. 361,360. Dated April 19, 1887. This improved rivet is intended for securing flexible materials, such as leather, etc., together. It consists of a rivet having a circular head in combination with legs or extensions projecting at right angles therefrom, these legs being corrugated or fluted longitudinally.

APPARATUS FOR TREATING NIGHT SOIL.—W. E. MacIvor, Sydney, New South Wales. No. 361,367. Dated April 19, 1887. This relates to the treatment of night soil, so that its products are merchantable commodities. The object of the invention is to profitably dispose of night soil. The products of the process are a measure of marketable values and sulphates of ammonia. The patent covers an apparatus for the treatment of this night soil.

WOVEN FABRIC.—Robert H. H. Hunt, S. F., assignor to the Hunt Automatic Loom Company. No. 361,360. Dated April 19, 1887. This improvement in woven fabrics consists in

The Anaconda Smelter.

The Greatest Copper Smelter in the World.

The statement was made last year, says the *Anaconda (M. T.) Review*, that the Anaconda Company owned the largest copper plant in the world. The statement will have to be enlarged in some way this year, because the plant has been enlarged and improved in many ways. Any one who had been absent from the smelter for a year would now scarcely be able to recognize it. At the upper works the new machines-shop, the tailings building and the extensive addition to the concentrator have been the principal external improvements.

The changes inside appear even more extensive than those on the outside. Last year the difficulty that the works had to contend with was that the 26 furnaces overbalanced the producing power of the concentrator. It was probably this fact which first led to the idea of building a new concentrator. This deficit has now been made up in a simple manner. The delivery of ore in the concentrator was made automatic, and a steam stamp, with a capacity for treating 200 tons per day, was added to the concentrating plant. Last month offered the first opportunity for a continuous test. The whole 26 furnaces were kept running all month, and the concentrator got so far ahead that it

not done, as it appears now, the whole work of building the lower concentrator will have been wasted. We have heard rumors of the letting of contracts for the construction of smelting furnaces, but so far have been unable to verify them.

Notes.

Otto Stallman, on Friday, was appointed superintendent of the entire concentrating plant at Anaconda, including both the upper and lower works.

Thirteen carpenters are busy at the lower yard, making the framework for a new tailings-mill, 50x155 feet. The framework will be brought to the upper works as soon as completed, and the building put up just across the track from the present tailings-mill. The last year has been a pretty hard one on Anaconda on account of the long shut down. This spring opens up, however, with the prospect of a more prosperous season for the Smelter City than she has ever before enjoyed.

A Freak of the Yucca.

To those crossing the Mojave, the yuccas are objects of constant interest. Their verdure in the midst of arid wastes is a great surprise. The strange and almost fantastic forms which they assume excite wonder and give full play

to the imagination in investing them with grotesque significance. The correct form of the tree is upright, with quite a symmetrical arborescent outline; but their insecure rooting in the desert sand places them at the mercy of the frequent windstorms and they are seen distorted and misshapen. The engraving shows one of the most interesting of these freaks to be seen on the desert. The top has evidently proved too heavy for the trunk, and it has gradually sunk to one side until it has returned to the plain and become imbedded in the sand. Storms have no doubt contributed to this result, but the trunk was too strong to break and the rooting too secure to let go its hold, and the result is that the tree assumes arch form, and now, braced at both ends, bids fair to defy the elements for years to come.

Our engraving is from a copyrighted photograph by C. R. Savages, now a resident of Salt Lake City, and our reproduction is by his special permission. The arch is broad enough to allow several horsemen to ride abreast beneath, and its height, as shown by the figure of the man, is probably from 12 to 15 feet at the apex. From the upper surface, as the picture shows, a single branch has approached this vertical as nearly as possible, and may yet form quite a tree-head at this point.

This yucca of the Mojave is the tree from whose trunk most excellent pulp is obtained for paper-making, and its manufacture is now being carried on by an English company, furnishing paper stock for the *London Telegraph*, as has already been described in our columns.

EXPERT MINING PROSPECTORS.—Jas. Bannalack yesterday received a letter from Georgetown, British Guiana, from the agent of a mining company who desired him to secure the services of two expert mining prospectors, who understand their business and know how to rough it. They are wanted to prospect for quartz and placer diggings in the newly discovered gold fields in British Guiana, near the boundaries of Venezuela. The placers are already yielding well, but quartz veins have not yet been discovered, and a London company with an ample capital, has been organized for that purpose, and it is proposed to prospect the country thoroughly to find quartz. Mr. Bannalack is authorized to send two of the right kind of men, who will be paid good salaries, and their expenses on the trip. The journey is a long one from California, being by rail from here to New York, thence by steamer to St. Thomas, in the West Indies, at which point another steamer is taken to Georgetown, Demerara, British Guiana. From Georgetown the travel is by river steamer to within 70 miles of the gold fields, the latter distance being made in small boats.—*Grass Valley Union*.

CURIOUS GROWTH OF A YUCCA ON THE MOJAVE DESERT, CAL.

a novel combination of the warp and weft, and especially in the construction of the selvage. In this ordinary woven fabric, the thread is reeled off the bobbin and laid in by the passage to and fro of the shuttle in one continuous thread, while in this improved fabric the thread forming the filling is cut in pieces the length equal to about twice the width of the fabric, and laid in so as to interlock and bind the selvages.

ELECTRIC ARC LAMP.—Gustav A. Wisse, S. F. No. 361,663. Dated April 19, 1887. This may be best described without going into the details of the operating mechanism as follows: The lower stationary carbon and upper moving one, with the controlling escapement, gearing and pinion by which the rack carrying the upper carbon is allowed to move downward by gravitation, in combination with a frame horizontally fulcrumed, and having the escapement pivoted upon one side of its fulcrum and the escapement wheel upon the opposite side, and an electro-magnet with which one end of the frame is connected, so as to be raised and throw the escapement out of action. The horizontally fulcrumed frame has one end connected with the armature of the magnets so that it is raised or depressed by the varying resistance of the current. In this way the carbon-carrying mechanism and its carbon is stopped when it has approached to a proper distance from the negative carbon.

The Carbondale mine, Alum creek, has joined the ranks of the producing mines of Nevada.

had to be shut down for five days. The product of the furnaces for the month of March was 4070 tons of matte, which considerably exceeds the output for any preceding 30 days in the history of the works. These are facts and figures for the grumblers, and especially for the New York *Engineering and Mining Journal*, which last week displayed its underhandedness by estimating the Anaconda's output for this month.

The number of men now employed at the upper works is about 600. The details of the work have been so perfected that this number of men is amply sufficient to carry on the work, though they seem lost in the vast buildings.

Work is still progressing at the lower works. Some 30 carloads of machinery has already arrived and is being placed in position. A large part of the machinery is for the 60-stamp silver mill, which will be the first part of the lower works to be gotten under way. It is the intention of the company to provide the concentrator with three steam stamps similar to the one in use at the upper works. The machinery for one of these stamps has arrived, and the work of placing it in position has begun. Supplied with three of these stamps the new concentrator will be able to produce 400 tons of concentrates daily. This will require the hauling of 1200 tons of ore daily from Butte, or, in other words, will exactly double the capacity of the largest copper-smelter in the world.

Now, the idea which at once suggests itself is: What is going to become of all these concentrates? The upper concentrator is now more than able to supply all the furnaces that the company owns. Hence the building of furnaces at the lower works seems inevitable. If this is

Passing Events.

It is reported that the old placers and the silver mines which were formerly worked by the Aztecs have been found in the Sierra Madre mountains, Mexico, by a party of prospectors.

The Anti-debrie Association officially announce that it has no contest with quartz or drift miners, notwithstanding assertions to the contrary.

Quite a boom is expected in Montana mining matters this season. Of course, Butte is the center of mining operations in that Territory, but there are several other camps which are making a very good showing.

The mining men in the Territories are very much excited over the probable workings of the Alien Land law, which they fear will entirely prevent English and other foreign capitalists from investing in mining properties. The law applies only to the Territories.

It is evident that the quartz interests of California will be further advanced this season than ever before. From all parts of the State, accounts come which give good promise of the future.

MINING DIVIDENDS in April aggregate \$268,000, as follows: Homestake Mining Co., \$25,000; Con. Cal. & Virginia Mining Co., \$108,000; Ontario Mining Co., \$75,000; Paradise Valley Mining Co., \$10,000; Plymouth Con. Mining Co., \$25,000; Silver King Mining Co., \$25,000.

The So-Called "Alien Act" and its Effects.

Congress at its last session passed a law by the provisions of which no person not a citizen of the United States, or who has not declared his intention to become such, can acquire, hold or own any real estate in any of the Territories or in the District of Columbia, unless it be acquired by inheritance or in the collection of a debt by ordinary process of law; this inability applying, also, to any incorporation not created by or under the laws of the United States or of some State or Territory. Under this law no incorporation or association whatever, more than 20 per cent of whose stock is owned by foreigners, can acquire or hold any real estate in any of the Territories or in the District of Columbia. Under this law no incorporations, except such as are organized for building railroads, canals or turnpikes, are allowed to own more than 5000 acres of land in any of the Territories; nor can any company organized for building such structures own any more land in the Territories than is necessary for operating the same, unless such land has been granted to it by Act of Congress. Any land acquired and held in violation of the provisions of this law is liable to be forfeited to the United States.

This Act of Congress, of which the above is a synopsis, appears to us to be open to criticism. In the first place, it seems to have been drafted in a loose and careless manner. What does the author of this law mean by "territories in the District of Columbia," as he has it in the last clause of the second section of the Act? Or why does he speak of the "territories," commencing the word with a small "t," as if he supposed they consisted of unsegregated portions of the public domain instead of representing organized political divisions of the country?

Though obscure in its meaning and faulty in its style and phraseology, this law is open to other and more serious objections. Indeed, we are at a loss to guess why it ever was passed at all. Granted that it will be repealed at the next session of Congress, that fails to satisfactorily explain the reason of its enactment! Of course, we know that it was ostensibly designed to prevent the further acquisition of large tracts of farming and grazing lands by foreigners. But why extend its provisions to mines and mining properties? Who was complaining because foreigners were investing their money in real estate of this kind, or what possible cause could there be for such complaint? None whatever! The owners of mines in the Territories were only too anxious to have them do so. To the Old World, with its cheap and abundant capital, they naturally looked for aid. To induce these people abroad to assist them with their ample means is what these miners have been laboring to accomplish from the first. Overlooking the many losses they had in times past sustained in mining ventures, these people, beginning once more to regard this class of investments with favor, had been turning their attention strongly of late to these west-lying Territories of the United States.

At this juncture, when foreign investors were beginning to take a lively interest in our mines; when the sales of many valuable properties were being negotiated abroad, and millions of unemployed English capital was about to be transferred to this country, Congress in its wisdom enacts a law that not only tends to discourage foreign investment in our mines but may have the effect to prevent it altogether. From every quarter we hear of the mischief it is likely to cause, and has, in fact, already caused. We see it stated in the *Engineering and Mining Journal*, by a party claiming to be conversant with the facts, that sales of mines in Idaho alone to the amount of \$10,000,000, pending in England and Scotland with every probability of being consummated, have already fallen through and been abandoned in consequence of this law. That Montana has from this cause suffered to an equal, and the other Territories to a proportionate extent, may reasonably be inferred. But the injury already caused will be as nothing compared with what will in the long run result from this ill-advised enactment.

The English, if late accounts from London may be believed, have, with much unanimity, determined to give our mines the "cold shoulder," and turn their attention to those in their own colonial possessions and in other countries. Of such significance did London manipulators of

South African mines consider this Act to be that they cabled the whole of it to the Caps of Good Hope the moment it came to hand. This effect of the measure in the British metropolis is described by a correspondent of the New York *Times* as follows:

"The detailed provisions of the Alien Land Act, when made known here, created the greatest excitement in financial circles. One great city speculator tells me that not less than 300 big American land schemes are knocked in the head by it. For years London has been full of American promoters of all sorts—mines, ranches and estates, to sell or float in companies—these ranging all the way from millionaires to needy adventurers. These gentry are now conscious that they have sustained a grievous setback. Dorsey, who recently gave a great and ostentatious dinner here, is now in Holland, where he was negotiating with an Amsterdam company to buy a tract of several millions of acres in New Mexico, with a view to selling it here to a London syndicate if he succeeded. He is now badly left, since he will be unable to find a purchaser either here or in America, Rufus Hatch is also here, trying to unload a nice little ranch, and finds himself high and dry. City investors and agents are in almost a state of panic, since it is uncertain how deeply the clause forbidding aliens to have even an indirect interest in land may shake mortgages and loan companies. The Mines Company of Gresham House, the biggest concern of negotiating agents in Europe, has passed a resolution that hereafter it will refuse to deal with any and all American mines, lands, and securities in the Territories, even if the way is found to evade the law. The fact has scared the heretofore credulous English public out of all notion of touching American investments."

If the foregoing statements do not grossly exaggerate the feeling aroused by the enactment of this law in England, it is going to inflict serious and all but irreparable injury on two of our leading interests; irreparable because if the law is repealed that will not repair the harm it has already done. Confidence destroyed and capital diverted into other channels cannot be restored in a day nor by any legislative proceeding. What renders this whole business the more stupid and provoking is the fact that there existed for this law no necessity whatever. Its enactment was wanton and uncalled for both as it applies to these wild lands and the mines. No public interest demanded, and no intelligent portion of the community asked for it. The author of the bill, one Payson, a member of Congress from Illinois, doubtless supposed he could make some political capital out of it by catering to the prejudice entertained by certain classes against foreign investors. This person, when questioned, admitted his ignorance of mining matters, and the probable effect the measure would have upon that industry. That this bill was suffered to become a law was due probably to its having been passed at the very close of the session, whereby it escaped the scrutiny of the other members of Congress. That it meets with universal condemnation throughout the mining regions it is needless to say.

Napa County Quicksilver Mines.

We had a conversation this week with a gentleman from Napa county, from whom we gather the following information concerning the quicksilver mines: The Etna Consolidated Company is at present doing little in the way of taking out ore. They have been engaged in sinking the shaft at the Star claim, where they are vigorously at work. They have run back from the bottom of the shaft about 130 feet, and in another month hope to strike the vein and ore. Then the coarse-ore furnaces will be started. At present they are running only the continuous-feeding coarse-ore furnaces. The company's mines are now yielding from 125 to 130 flasks of quicksilver per month. When the coarse-ore furnaces are also at work the mines yield about 275 to 350 flasks per month. At present 35 men are kept at work, but when all the furnaces are running full blast 125 men are employed.

The Oat Hill mine, owned by the Napa Consolidated Company, is being worked with more or less vigor, and one furnace is running.

Some new prospects are being started up in the vicinity of Middletown. Two new furnaces have recently been built at Middletown on a new claim. The claims in that vicinity have produced comparatively little mercury so far.

W. P. STOUT, who has been for a long time one of the trustees of the Mechanics' Institute, has resigned and has been appointed general agent of the Mechanics' Fair, at a salary of \$150 per month, his duties to commence May 5th.

Sewerage of Cities.

The city of San Diego has adopted a wise course in employing the distinguished sanitary engineer, Col. Geo. E. Waring, Jr., of Newport, R. I., as consulting engineer, for the purpose of advising a system of sewerage.

In conversation with Col. Waring, we learn that the proposed sewerage of San Diego is as follows: A main-intercepting sewer runs along the lower part of the city in which three other main-intercepting sewers enter. The topography of San Diego is very favorable for sewerage. The grades of the streets are sufficiently steep to secure a rapid flow. The largest pipe of the main-intercepting sewer is 24". All sewers are ironstone pipes. The end of every branch is provided with an automatic flush-tank, discharging about 20 feet of water every 24 hours, clearing the branch sewers. The outlet is 24" cast-iron pipe, which carries the sewage from the intercepting sewer into an automatic tidal reservoir, filling at high tide and discharging at low tide. From this tank the sewage is carried by a 30" cast-iron pipe into the deep channel of the harbor, which carries it out to the ocean. This system is perfect. The city of San Diego has issued \$400,000 bonds, 5% interest, and redeemable in 20 years. The specifications for all the work are advertised for a period of 20 days in the *San Diego Union* and the *San Francisco Chronicle*.

Col. Waring uses the separate system. The difference between the separate and combined systems is, that no rain-water is admitted into the sewers in the separate system. In Colonel Waring's work on "The Sanitary Drainage of Houses and Towns," pages 133, 134 and 135, the following paragraph occurs: Sewers choke and overflow during heavy storms mainly because they are too large for the work they are ordinarily called on to perform. If a sewer is so small that its usual flow is concentrated to a sufficient depth to carry before it any ordinary obstruction, it will keep itself clear. But if, as is almost always the case, where the engineer lacks experience, or where he defers to the ignorance of the local authorities, it is so large that its ordinary flow is hardly more than a film, with no power even to remove sand, we may be quite sure that its refuse solid matters will gradually accumulate until they leave, near the crown of the arch, only the space needed for the smallest constant stream. And, in order to make room for a rainfall flow, the whole sewer will have to be cleared by the costly and offensive process of removal by manual labor. A smaller sewer would have been clear by its own flow. The smaller and broader the stream, the more the friction against the bottom and sides, and the greater the retarding of velocity. A brick will stand unmoved in a shallow stream of water running sluggishly through a 15" drain, while if the same stream were concentrated into one of 5" drain it would have so much greater depth, force and velocity that the brick would be entirely covered and swept away.

One principle is very apt to be disregarded in regulating the sizes of sewers; that is, that after water has once fairly entered a smooth conduit having a fall or inclination toward its outlet, the rapidity of its flow is constantly accelerated up to a certain point, and the faster the stream runs the smaller it becomes; consequently, although the sewer may be quite full at its upper end, the increasing velocity soon reduces the size of the stream, and gives room for more water. It is found possible, in practice, to make constant additions to the volume of water flowing through a sewer by means of inlets entering at short intervals, and the aggregate area of the inlets is thus increased to very many times the area of the sewer itself. Where a proper inclination can be obtained, a pipe 18" in diameter makes an ample sewer for a population of 10,000.

The presence of Col. Waring on this coast has caused other cities to take advantage of his experience, and several have requested him to examine their ground, in reference to a system of sewerage, among them Los Angeles.

The city of San Diego, in this prompt movement, has acted more wisely than any other city or town in California.

San Francisco is the worst-sewered city in this State. We have no system at all. All brick sewers are 3'x5', without consideration of the number of persons contributing to them; in many cases the sewers do not join any main branch. There are a great many instances

where sewers along one street are of different sizes. For instance, on Washington street, from Drumm street to Mason street, brick sewer, 3'x5'; the elevations at the crossings of streets of this part of the street are: Drumm, Davis, Front, 0'; Battery, 1.75'; Sansome, 3.5'; Montgomery, 6.0'; Kearny, 28'; Dupont, 64'; Stockton, 102'; Powell, 152'; Mason, 182'.

From Mason street to Taylor (one block) 16" cement pipe; Taylor to Jones (one block) 18" ironstone pipe; Jones to Leavenworth (one block) 16" cement pipe; Leavenworth to Hyde (one block) 18" ironstone pipe. The elevations at the crossings of streets are: Mason 182'; Taylor 252'; Jones 332'; Leavenworth 305'; Hyde 255'. The area drained by this sewer is 13,500 square feet. At Battery street, a branch sewer joins this sewer, a 3'x5' brick sewer; the elevation of the crossings of streets are: Jackson 1.75', Pacific 4.7', Broadway 12.0', Vallejo 10, Green 7.5, Union 5.0, Filbert 2.5.

This example is sufficient to prove that no system of sewerage whatever exists in this city. The worst feature of our sewerage is that all main sewers discharge into the bay at the ferry landings and wharves.

The Mayor and Board of Supervisors should take advantage of the presence of Col. Waring in this city, and employ him as consulting engineer for a new and effective system of sewerage. The State Board of Health has often called the attention of the Board of Supervisors to the danger threatening the city from the exceedingly bad sewerage; cases of diphtheria are frequent here, and if the cholera should be imported here from Mexico, and Chili, and Peru, where it now prevails, no quarantine will help to prevent its introduction. San Francisco is a large city, and has, in fact, no system of sewerage, so that it should follow the example of the wise action of San Diego.

Production of Gold and Silver.

The estimate of the entire production of gold in the United States since 1804, as given in the report of the Department of Mineral Statistics, U. S. Geological Survey, amounts to \$1,708,715,670; the corresponding total for silver is \$792,283,217; total yield of both metals equals \$2,500,998,887. (In 1885 California ranked first in gold, eighth in silver, and second in the combined production, as compared with other States and Territories.

The above estimate is based on the following figures: Output of Southern States from 1804 to discovery of gold in California in 1848 (based on estimates of Prof. J. D. Whitney), \$13,243,475. Product from 1848 to 1879, inclusive, by fiscal years, gold, \$1,480,041,532; silver, \$422,722,260; total, \$1,902,763,792. Fiscal year ending June 30, 1880 (census figures), gold \$33,379,663; silver, \$40,110,957; total, \$74,490,620. July 1, 1880, to Dec. 31, 1880 (estimated on the basis of half product of fiscal year 1881 in Mint Report), gold \$18,250,000, silver \$21,050,000; total, \$39,300,000. Calendar years 1881 to 1884, inclusive (as reported by Director of Mint), gold \$128,000,000, silver \$184,800,000; total, \$312,800,000. Calendar year 1885 (reported by Director of Mint) gold \$31,801,000, silver \$51,600,000; total, \$83,401,000.

These make the sum totals given in the first paragraph above. The annexed diagram shows the varying production for each year up to Dec. 31, 1885, of the whole United States.

MINERAL LANDS.—The Secretary of the Interior has advised the Commissioner of the Land Office to request the California & Oregon railroad to relinquish Section 27, Township 24 north, Range 3 east, in the Marysville land district, and if the company refuses to relinquish the same, to bring suit to recover. It appears from the report of Special Agent Rainey that the section of land in question is gold-bearing mineral land, and that therefore the company is not entitled to it under its grant.

WALTER E. DEAN, one of the trustees of the State Mining Bureau, before leaving on a visit for the East and Europe, left his resignation with the Governor. George W. Grayson, of Oakland, has been appointed in his place. Mr. Grayson is well known among the mining circles, and has large mining interests.

The output of coal from the coast collieries is easily supplying the deficiency caused by the scarcity of foreign descriptions.

Prosperous Quartz-Mining Centers.

In contemplating some of the prosperous quartz-mining centers of California, few persons are aware of the ups and downs they have experienced and the struggles their present advanced position has cost them. Take Grass Valley for example, now one of the most active quartz-mining localities in the State—who, looking at it to-day, would suppose it had ever had its setbacks and reverses? And yet it has had to encounter these even in the flash days of gold mining, as is shown by the following, extracted from a sketch of the place, prepared by the Hon. A. A. Sargent, and published in 1855:

As late as January, 1851, there were but three or four cabins in Grass Valley proper. Shortly after, the population increased rapidly and an attempt was made by the people to change the name to Centerville, as there were so many places known as Grass Valley it was difficult to have letters properly sent. The growth of Grass Valley in 1851 was most remarkable. Probably no town in the State has ever sprung so suddenly into importance. Much of this was owing to an excitement in reference to quartz mining, then in full operation. The first piece of gold-bearing quartz was picked up on Gold Hill in September, 1850, by a German, who disturbed it with his foot while

Conway & Preston in the fall of 1851, and is now working profitably. Col. Richardson erected one in the summer of 1851. The Mount George mill was erected about the same time. In 1852 the French Company erected a mill; the Rocky Bar Mining Co. and James Winchester in the same year. The latter has been used only for lumber, though originally designed for quartz. The Union Co. constructed a mill in 1853, but the lead was abandoned and the mill removed.

The first quartz mining was on Gold Hill, the next on Massachusetts Hill, where the first claims were taken up in December, 1850, by A. Delano, generally known as "Old Block." We believe the "chips" did not snit him, so he turned his attention to expressing for Wells, Fargo & Co., in which position he occasionally expresses the ideas that have made him so generally known in the State.

In continuance of the above reminiscences it may be added that in 1851 Commodore Stockton put up two quartz-mills, one in Mariposa and one in Grass Valley, the crushing being effected on the plan of the pestle and mortar, the cam being so arranged as to partially revolve the former. In these mills a separate mortar was provided for each stamp or pestle. The first blankets employed for catching gold in California were introduced by Melville Attwood, in the Gold Hill mill. Here also the

ANNUAL PRODUCT OF GOLD AND SILVER IN UNITED STATES.

carrying a bucket of water. The piece was sold by him to F. Squire for \$5, and proved to be worth \$100. Several of the miners of the neighborhood, and a good many from Deer creek, immediately went on to the hill and broke up the pieces of quartz which lay exposed, but as they found nothing, the excitement died away till the 1st of November, when a party—of whom James Huff was one—in getting out rock for the chimney for a cabin they were building on Gold Hill, struck a quartz ledge, where it was rich. Claims were immediately staked off, and men began to pound the quartz in mortars with spring poles. Huff's company took out about \$20,000 in ore; this was during the winter and spring. The first quartz-mill was built in January, 1851, on Wolf creek, nearly opposite the present Empire mill, by two Germans, for Mr. J. Wright, Jr. The building still stands. The mill (a water-mill) was a small affair and not successful, but it was the second one built in the State, the first mill being built in 1850, in Mariposa county, which also proved a failure. Grass Valley claims the first successful quartz-mill in California. In the winter of 1850 and 1851, Messrs. Sowers, Abby & Ridgell built a small steam-mill. In the spring of 1851, Judge Walsh erected a quartz-mill, which he afterward sold to Collins & Crossett, which mill has always paid. The Gold Hill Co., about a month afterward, commenced the erection of a mill, and Judge Walsh another one later. An English company, called the Agua Fria, bought the interest of the proprietors in the mills and leads in August, 1852, and still conduct the business under the superintendence of Melville Attwood. The new Helvetia mill was erected by

first shoes were added to stamps, these too being the invention of Attwood. This gentleman before coming to California having had much practical experience in quartz mining—gained in South America—was able to render valuable service to the young industry in this State. For advice and aid freely rendered, Attwood has an abiding place in the memory of our pioneer quartz miners.

Early in the history of Grass Valley the Allison Ranch, the Empire, and other notable mines, ran their brilliant careers and subsided. In the Empire, the notorious Lola Montez, then a resident of the town, was a large owner. From its profits this woman obtained most of her wealth, at one time considerable, though she at last died poor.

Scarcely any town in the State suffered more from outside excitements than Grass Valley. The Fraser river stampede having taken away in 1858 many of the working miners, the Washoe heira in 1860 robbed her of her moneyed men, millwrights, metallurgists and other skilled miners, leaving the place for a time poor indeed. But she has long since recovered from these disasters, standing to day one of the most thrifty and progressive quartz-mining towns in the country. Besides many valuable new mines developed since the era of her decadence, several of the old ones, after a long season of idleness, have been resuscitated and are now yielding splendidly, with the promise of a long life ahead of them. That other of these neglected properties will in like manner be restored to a profitably productive condition, there is good reason to believe, there being but few mines in the neighborhood that are probably dead beyond resuscitation.

Quartz and Drift Mining.

The hydraulic miners of this State made a strong fight for what they considered their rights, before the courts in a litigation that lasted some years. The decision was against them, as is well known, and they were enjoined from doing further work on their mines. This decision virtually destroyed their property, since they were no longer allowed to use it for profit, and it had no value for sale. Thousands of men were thrown out of employment, and property worth millions was rendered valueless. The controversy was a most unfortunate one for the hydraulic miners and for the State, but it was one which was bound to come. As to the merits of the decision, they have been discussed thoroughly by all interested, though those who were injured will never be convinced that they were justly dealt with.

Toward the latter end of the litigation, effort was made to draw into the controversy the owners of quartz and drift mines. The hydraulic miners had been compelled to advance large sums for legal expenses, and they desired the assistance of quartz and drift miners, as money was not plentiful. Those miners not engaged in hydraulicking, however, generally refused to place themselves in the position of defendants, when there were no complaints against them.

It was perhaps natural that the hydraulic miners should seek pecuniary assistance from men in other branches of the same vocation. But the judgment was, to say the least, questionable, that would draw these men into litigation against their will, or that would in effect cause them to confess that they were engaged in a pursuit that the courts afterward, whether justly or not, decided to be illegal.

While there may have been an exception or two, the quartz and drift miners generally have not been interfered with. And we are not among those who ever thought they would be. While some hot-headed and fanatical enemies of the miners may have desired such interference, it was not a thing which those who were fighting the hydraulic debris proposition would have urged as a body; and if they had, it is not at all probable the courts would have upheld them. Even should such a thing, however, have been possible, the debris from this class of mines would easily have been disposed of to the satisfaction of all, as it is now.

It is rather remarkable, it may be noted, that the effort to draw the quartz and drift miners into the debris controversy was fostered more by some of the hydraulic miners than by their avowed enemies. But no man with a quartz-mining property, particularly, has been deterred from pursuing his work for fear of injunction based on the Woodruff decision, and drift mines are being worked in all directions. While the quartz and drift miners very naturally sympathize with their brethren of the pick and pan, it would have been a poor business proposition to place themselves in a necessarily embarrassing position in order to assist them.

The mere bringing up of the question of accountability in the matter of quartz and drift mines, and making it a subject of frequent public comment, was calculated to more or less prejudice these interests, and, as a result, the gold-producing interests of the State. It was had enough to actually stop the production of hydraulic mines, without suggesting that other branches of gold mining were in danger of stoppage too. It would destroy the confidence of intending purchasers, and hinder development as well. For these reasons the PRESS has had less to say concerning the subject, for it never saw any real danger to these interests. The matter is only mentioned now for the reason that official action by those parties who have been fighting the hydraulic miners for years, has been taken, and they officially declare they never had any intention of interfering with the other branches of mining.

At a meeting held at Marysville, May 2d, the directors of the Anti-debris Association and their advisory committee of 40 unanimously adopted the following:

WIRELESS. It is continually reiterated by the hydraulic miners and their organs, notwithstanding the repeated assertions to the contrary by the Anti-debris Association of the Sacramento valley, that our people are hostile to all kind of mining, and that we intend to enjoin the quartz and drift mines; therefore be it

Resolved, Once more by the directors of the Anti-debris Association and their advisory committee, that we have no quarrel or cause of action against quartz mining, and none against drift mining when legitimately conducted as in the past.

MECHANICAL PROGRESS.

California and Oregon Woods for Decoration.

The natural woods of California are beginning to be largely used for decoration—for the interior finish of expensive residences. They have been used quite extensively, indeed, for eight or ten years, both at home and abroad. The woods most generally used are the redwood, the white cedar, the laurel and the eucalyptus. The redwood takes the lead for general use, and is largely used for interiors. It will take a good polish, and is the best cheap wood for finish that California produces. For general use, wear and staying qualities it has no superior in any forest in the world. The laurel is smooth, firm, beautifully figured, and altogether a most desirable wood. The value of the eucalyptus as an ornamental wood has only quite recently become generally known. Its grain is much like that of the Eastern beech—has waving lines close together. At the East it is called buttonwood. It is quite tough and strong, qualities which give it value for veneering. At several of our Mechanics' Fairs have been shown excellent exhibits of California fancy woods—plain and polished—which have greatly surprised people, both at home and from abroad, who have not familiarized themselves in regard to what California forests can do in this way of such desirable products. A similar exhibit was made by the C. P. Railroad Co. at the Centennial Exposition in Philadelphia.

Oregon Woods.

Oregon is also able to make a fine display of woods. The Oregon ash is a very pretty and useful fancy wood. It is figured with concentric curves and admits of a good polish. The maple of that State is also beautiful. It looks very well in furniture and is beginning to be sought after for such purpose by manufacturers in San Francisco. Light yellow in color, its surface is covered with small, wavy lines. A somewhat enthusiastic writer says: "It reminds one much of a sheet of burnished gold, and when the gaslight plays upon its burnished surface the effect is grand." Still, like most of the Oregon woods, it is but little known. Indeed, aside from the world-renowned redwood, the real beauties of either Oregon or California woods are but little known. They are known only to the few who have become efficiently interested in them to make them a study. It is only such persons who are anything like fully aware of the undeveloped industry which lies dormant in the beautiful figured woods of the Pacific Coast.

THE NEW STEEL GUN.—The army ordnance officials are quite jubilant over the results obtained last week at Sandy Hook with the new 8-inch steel gun, which was recently hooped to the muzzle after having been fired successfully 24 rounds. Since the rehooping, the gun has been fired 19 rounds, making 43 rounds in all. The ordnance officers who witnessed the trial report that during the last firings, the gun, with a powder charge of 110 pounds and a 289-pound shot, gave the following results: Initial velocity, 1878 feet; pressure, 36,000 pounds per square inch; energy, 7066 foot-tons. With a 302-pound shot, the powder-charge and density of loading being the same, the results produced were: Velocity, 1857 feet per second; pressure, 37,000 pounds per square inch; and energy, 72.19 foot-tons, which is equivalent to an energy of a shot of 289-pound weight with a velocity of 1,893 feet per second. These results are considered equal to those given by the Krupp 8½-inch gun, and considerably in advance of anything produced by guns of similar dimensions.—*Army and Navy Journal*.

AN IMPROVEMENT IN THE SHUTTLE.—A man named Thompson, of this city, has patented a device which is attached to loom shuttles, for the purpose of doing away with the necessity of drawing the weft with the breath in order to get it through the "eye" of the shuttle. This continual drawing in of the air laden with dust is the most fatiguing part of a weaver's work. The new arrangement which is simple, consists of a longitudinal groove at the "eye" end of the shuttle, which returns at an angle, slipping the yarn into the "eye." The groove is lined with a thin metallic plate to regulate the "draft" and prevent "fuzzing." It has been tested by practical weavers, and it gives perfect satisfaction, the threading of the shuttle being done as quickly as by the old way.—*Fall River Globe*.

STEEL IN LOCOMOTIVES.—A change of some moment is being made in the construction of the locomotives of the Northeastern Railway of England. Hitherto the hulk of the locomotives on that line have had their boilers made with plates of iron—the iron of some of the South Yorkshire firms; but now steel plates are being used, and steel axles are also being substituted.

STEP CONE FIRE-BOX.—An English firm, Messrs. Partington & Co., of Bradford, are putting on the market a step cone fire-box, with the object of securing strength and firmness from the steps of each cone, and a form which makes studding unnecessary and facilitates examination and cleaning. It is claimed also that the flanged-stepped cones present a greater

amount of impinging surface to the action of flame, and thus increase the efficiency of the heating surface, while the increased water space at the crown of the fire-box, gained by its conical form, is effective in preventing priming.

INDUSTRIAL TOWNS on the plan of Pullman, near Chicago, seem to be getting popular. A few weeks ago the announcement was made that Jay Gould proposes to found such a town near St. Louis. Now it is said that the Atchison, Topeka & Santa Fe Railroad Company will build another Pullman about 11 miles west of Kansas City. Large manufacturing establishments will be located there, surrounding which will be a miniature city with all the conveniences and advantages of modern life. Another scheme of the same sort is reported to be under way near Lincoln, Neb., promoted by the Chicago, Burlington & Northern Railway Company.

If there is one thing of which American manufacturers may justly feel proud it is their reputation for furnishing what they contract to furnish, both as to material and workmanship. With no intention to boast of this, the helahorings which English technical journals are giving manufacturers for their shortcomings may well lead us to a little pride in the matter. Chains, we are told, are made in England with an occasional link only of good iron; articles of hardware are sent abroad which are so abominably bad that trade is ruined thereby; textile fabrics are about as bad as had can be, and so on through this list. We should be sorry to give English manufacturers so poor a character as they get from their own technical press.—*American Machinist*.

FLOAT TIMBER AND DRY ROT.—It has been ascertained that timber which has been floated in water for a considerable time is no longer liable to the attack of dry rot. The alumen and salts are slowly dissolved out, thus depriving the fungus of the nutriment needful for its development. A French experimenter has shown that fresh sawdust rots away in a few years in damp earth, whereas sawdust from which the soluble matters have been soaked by water remains unchanged under like circumstances.

THE FASTEST TORPEDO-BOAT.—A torpedo-boat for the Chinese navy, built by Messrs. Yarrow & Co., had her official trial, when she attained the remarkable speed of nearly 24 knots per hour as a mean of six runs over the measured mile in the Lower Hope—three with and three against the tide. To be exact, the speed was 23.582 knots, and a subsequent run of two hours' duration gave a mean speed of 22.94 knots, with the engine running easy. The boat had on board her torpedo armament complete.

VALUE OF DIFFERENT PIG IRONS.—It is well known among old pig iron users that charcoal iron is first in purity, firmness of grain and tenacity, while anthracite iron comes next, coke irons next and bituminous next. There used to be a great deal of Scotch pig used, but the proportion is steadily diminishing, as it is the poorest iron coming into this market, and founders have discovered that several American irons, costing a great deal less, furnish a greater amount of castings.

THE DECAPOD LOCOMOTIVES.—The Decapod locomotives built last year by the Baldwin Locomotive Works for the Northern Pacific Railroad, are now at work in construction on the Cascade mountain division. The engines have been a surprise to the mechanical department of the road, owing to the unexpected ease with which they pass round the sharpest curves. They will go anywhere that an eight-wheel engine can go.—*American Machinist*.

A BELGIAN glass-blower at Meadville, Pa., accomplished the feat of driving a locomotive and train of cars with gas manufactured from crude oil. The device, which occupies a small space on the tender and is connected with the furnace, is very simple. The experiment has been pronounced by competent persons a complete success.

A GUN larger even than any of the monsters hitherto produced is now under construction by Krupp. It is 52½ feet long and weighs 315,000 pounds, although only 15½ inches in bore. Its lightest projectiles will weigh 1632 pounds, and will be propelled by 1070 pounds of prismatic brown powder.

HEATING CARS BY STEAM.—The Pennsylvania Railroad Company gives out that its experiments in heating cars by steam have been so successful as to authorize a definite announcement that the car stove will be banished from its passenger trains so soon as the requisite changes can be made.

PRESIDENT HOWELL, of the East River bridge, proposes to meet the demands for increased accommodation on that thoroughfare by utilizing the driveway as cable roads, thus permitting 14 four-car trains carrying from 30,000 to 35,000 passengers every hour.

THE output of the locomotive works of this country at present is estimated to number nearly 40 engines per week.

SCIENTIFIC PROGRESS.

Hard Water.

As the hardness of water is a matter which occasionally comes up for investigation by mechanical engineers, the following remarks by a correspondent of *The English Mechanic*, Mr. H. J. Hardy, F. C. S., will prove interesting. We quote: The hardness of water consists of two kinds—temporary and permanent. Permanent hardness is that which cannot be removed by boiling. To determine the total hardness proceed as follows: Take 50 c. cm. of the water, place in a stoppered bottle of about 10 ounces capacity, and run in standard soap solution until, after well shaking, allowing the bottle to lie at rest on its side for four or five minutes, the lather does not break up—or, in other words, until a permanent lather is obtained. Sometimes a false permanent lather appears, but by always adding another cubic centimeter of soap solution, when the process is thought to be finished, this error may be obviated, as the lather will at once commence to break up if it is not permanent. Should the water be a magnesium water, the entire solution must be so regulated that only about 8 c. cm. of this soap solution is used. If 50 c. cm. of the sample takes more than 10 c. cm. soap solution, dilute 50 c. cm. of the sample with 50 c. cm. of distilled water and work in half, doubling of course the number of cubic centimeters of soap solution used. For every 50 c. cm. of water used, whether sample or distilled water (for dilution) 1 c. cm. must be deducted for absorption. Magnesia may be estimated by precipitating the lime and applying the soap test to filtrate. Multiply result by 42.75, and it will give grains of magnesia per gallon. The permanent hardness may be estimated by taking about 0.5 liter, placing in a flask connected with an inverted condenser, and boiling for an hour. The water is then filtered from deposit, 50 c. cm. of the filtrate taken, and the soap test applied as before. This gives permanent hardness. This total hardness, less the permanent hardness, gives temporary hardness.

Car Lighting by Electricity.

The regular Boston "special," on the Boston & Albany Railroad, was, last week, lighted by electricity and heated by steam—an arrangement which adds much to the comfort of passengers and removes altogether the danger from fire, always imminent in trains lighted and heated in the old way. The use of incandescence lighting on railway trains is not novel, nor is steam for heating. The Pennsylvania and other railroads long ago used this system of lighting on some of their special trains, and steam has been used for heating cars and other conveyances for years. But, up to the present time, no system of electrically lighting trains has proved satisfactory from a practical standpoint, and if that now adopted on the Boston "special" fulfills its promise, a really important advance will have been made in applied science.

In the system in use, electrical accumulators, commonly called "storage" batteries, are placed under the cars, and these having previously been charged from a dynamo-electric machine, while the train was lying in the depot, give out electrical energy as required. In this particular case, there are 60 cells to each car, and these, it is said, are good for this round trip between Boston and New York, thus necessitating the maintenance of only one electrical station.

In every car there are 20 incandescence lamps, each of 16-candle power, thus being equal in intensity to a five-foot gas-burner. As these lights glow in a vacuum without combustion, there is no danger of their setting anything afire in case of accident. Indeed, the entrance of oxygen, through the breaking of a globe, puts an instant end to the life of the lamp.—*Scientific American*.

ALUMINUM BRONZE.—The melting point of aluminum bronze varies slightly with the amount of aluminum contained, the higher grades melting at a somewhat lower grade. The "A" grade melts at about 1700 degrees F., a little higher than ordinary bronzes or brass. Aluminum bronze shrinks about twice as much as brass, and hence due allowance has to be made for this in the mold and pattern. As the metal solidifies rapidly, it is necessary to pour it quickly and to make the gates amply large, so that there will be no "freezing" in the "gates" before the casting is properly fed. To obviate the shrinkage as much as possible, the metal is allowed to enter the mold at a temperature no higher than will admit of its running freely. Where there is a heavy mass of metal in the shape of an envelope surrounding a core, the contraction upon solidification will cause the metal to split unless the core is made to yield equally with the contraction. Baked sand molds are preferable to green sand, except for small castings.

ELECTRICITY FOR FARMING PURPOSES.—In a paper read by Mr. Rix, of London Colney, St. Albans, on "Harvesting," before the London Farmer's Club, says *Iron*, an interesting account was given by the lecturer of the employment of electricity as a motive power on the Hatfield estate, belonging to the Marquis of Salisbury. It appears that electricity is used at Hatfield for

many purposes, the elevators for building the hay and cornstacks being worked by its means. Arrangements have also been made to thrash by electricity. The power is obtained from a water-wheel in a central position, and carried by wires wherever it is required. Mr. Shillitoe, the resident engineer at Hatfield, supplies some details. He states: "We are using electrical power for pumping sewage for the purpose of irrigating the higher lands. This is most useful, as the power obtained from the river running through this estate can be had for nothing. We not only use the power for thrashing and for working the elevators, but we employ it at a much greater distance from the river—1½ miles—for cutting the rough grasses into chaff for ensilage, which has proved a great success. The same power is also used at a farmstead, half a mile from the river, for grinding all the barley, maize, etc., for cattle feeding." It thus seems that there is no limit to the use of cheap electric power wherever work is required to be done, thanks to water-power.

A LARGE BALLOON.—A captive balloon is proposed by M. G. Yon for the French Centennial Exhibition in 1889, which will have the enormous capacity of 60,000 cubic meters (2,119,000 cubic feet). The greatest altitude proposed to be reached in the ascensions will be 1000 meters (3280 feet), and it will be possible to take 100 passengers, a winding engine of 600-horse power being employed. In the construction of this balloon, the following point is of some interest—a principle of construction which, if we remember rightly, has been applied in a previous balloon. As the surface of the balloon must always be tight, in order to prevent the damage which otherwise a strong wind might cause, and to preserve this tightness, notwithstanding variations in temperature, another small balloon is placed inside the large one, and the volume of this small balloon, which is filled with atmospheric air, can be increased or diminished by pumping in or exhausting air by means of an air pump, worked by an electric motor on the car, the current for this motor being supplied by a twin cable from a dynamo on the ground.

HEATING TRAINS.—It is generally considered that the methods used in Europe for heating trains are far inferior to those employed here. The footwarmers generally employed in England and France are certainly very inefficient during a hard frost, and though very safe, not only hardly keep the passenger's feet warm, but entail a great deal of labor on the railroad staff at stations, as they have to be changed every two or three hours. A totally new system has been introduced on the Caledonian railway by Mr. D. Drummond, the superintendent of motive power, and has been used with great success on through trains running between Glasgow and Aberdeen during the last two years. It is claimed that the cars have been kept steadily at 62 degrees, which is considered a very satisfactory result, as in Great Britain dwelling houses are never kept at the high temperature usual here. Exhaust steam from the engine is used, the condensed water being allowed to escape under each car. When the engine is first attached to the train, live steam is turned on and the train is soon heated to a comfortable temperature.—*Railroad Gazette*.

A NEW USE OF NATURAL GAS.—Natural gas has been put to a new use at Sewickley, near Pittsburgh, Pennsylvania. According to report, around natural gas posts, within a radius of 20 feet, grass has been as green all the winter as in summer. For more than a month, pansies planted near these posts have been in full bloom. Taking advantage of this influence of natural gas, a market gardener is raising asparagus in the open air by the aid of the gas, and proposes to test its use in beds of vegetables heretofore grown in greenhouses.

NEW MODE OF PREPARING OXYGEN.—Into a suitable generating apparatus introduce two parts of commercial solution of peroxide of hydrogen (3 per cent) and a pound of dilute sulphuric acid (1.5). Into this mixture allow to enter gradually through a safety funnel a solution of 800 grains of potassium permanganate in 28 fluid ounces of water. Oxygen will be rapidly disengaged without application of heat, the yield from the above quantity of materials being five gallons.—*Bulletin de Pharm. de Lyon, Arch. de Pharm.*

A NEARLY PERFECT SIMPLE PENDULUM.—Mr. J. T. Bottomley, of the University of Glasgow, suspends a small shot of about 1.16 of an inch in diameter, by a single silk fiber (half a cocoon fiber) two feet long, in a glass tube three-quarters of an inch in internal diameter and exhausts the latter to about one-tenth of a millionth of an atmosphere. Starting with a vibrational range of one-fourth inch on each side of its middle portion, the vibrations can be easily counted after a lapse of 14 hours.—*Phil. Mag.*

METAL SCARFS AND NECKTIES are a new German invention. Gold, platinum and silver strips are welded, after the mosaic style, upon a metal ground, prepared by the incandescent process, then compressed by means of powerful presses, and finally elongated by rolling into long sheets or strips. The colors are yellow, red, green, white, gray and black, and the scarfs, being indestructible, are considered of practical value. They are manufactured chiefly at Baden and Pforzheim.

ENGINEERING NOTES.

Progress in the Art of Tunneling.

A French writer directs attention to the constant progress made of late years in tunneling and drifting through rock. Along with the improvements in rock-drills have come no less marked improvements in explosives. The results have shown themselves in a constant increase in the rate of advance in the daily amount of work performed. Thus in the Mont Cenis tunnel the average daily rate of progress was only 1.75 meters a day. In the St. Gothard tunnel, where more powerful explosives were used, the rate was 2.75 meters. In the Arlberg tunnel still further improvements in drills and explosives were used, with a better organization for work, and the rate of daily progress advanced to 4.15 meters. More recently the Levant tunnel was driven at the rate of 4.50 meters. And in the last great work of the kind, the Carrizo tunnel in Italy, where blasting-gelatin was used in deeper holes than those in which dynamite could work effectively, the average daily advance was 5.40 meters. Some allowance must, of course, be made in these estimates, for difference in the character of the rock encountered and other conditions of the problem; but as these averages are for the whole work, they represent approximately the progress made in the science and practice of mining since the completion of the Mont Cenis tunnel.

The Crnton Aqueduct Tunnel.

The work of driving this tunnel has awakened such earnest rivalry between the leading makers of drilling machinery, and the contractors and the men are so thoroughly imbued with the spirit of emulation which this rivalry has excited, that the work is progressing with unprecedented rapidity. When it is completed, the record of this tunneling done upon it will undoubtedly exhibit the most rapid and effective work of this kind that has ever before been accomplished, and will be highly creditable to our manufacturers of tunneling machinery, evincing, as it will, that the efficiency of this class of machines has been brought to a higher state in the United States than elsewhere.

THE INDO-EUROPEAN CANAL by way of the Euphrates valley and the Persian gulf, is still a matter of serious consideration, and will, no doubt, ere long become a necessity to the commerce of the world, as the Suez canal will soon be absolutely unable to meet the demands upon it. The project is a canal with a double aim, a canal of irrigation and of navigation. In this way it is proposed to restore fertility to these wastelands. The plan is to create a river from Soudieh to the Persian gulf by making the Euphrates flow to the Mediterranean by Aleppo and Antioch; from Beles, in deepening the river from Beles to Fendjah (near ancient Babylon); in passing from the Euphrates to the Tigris by the canal of Saklavijah; and lastly, in descending the Tigris from Bagdad to Kornab, Bassora, and Fao on the Gulf. The new canal would shorten the present route of going and coming to Bombay by six days. M. Eude, the chief promoter and engineer, does not consider the engineering difficulties of a serious kind—nothing which would seriously resist modern appliances. This was in ancient times the great route of commerce, before the founding and development of Alexandria diverted it on Suez and led to the Suez canal. The estimate of the total cost of the works do not exceed a milliard of francs, and the maximum capital required would be 1,500,000,000 francs.

THE TRANS-CASPIAN RAILWAY.—Naphtha is the fuel used for working this line. Prof. Vamhry has furnished the *Fortnightly Review* a very interesting description of this distant railway. After describing the manner in which the new fuel is used, he says: "In a country where there are no roads, where no fences, no gates and no watch-boxes are required, it was quite sufficient to place a watchman's hut every 12½ versts. Such a hut is built in the form of a barrack, and serves as the dwelling place of several workmen and watchmen. By its side is erected a small tower, from which the road can be surveyed for some distance right and left. But in order to inspect more minutely the state of the permanent way, to try the rails and to remove obstacles, two men start daily from the barracks, going six versts in each direction up and down the line. For this purpose each barrack is provided with two horses. On their journey out one rides and the other walks; on their return journey the one who rode walks, yielding the horse to his comrade, who now in his turn rides. By this clever arrangement, the inspection of the vast line of railway does not require more than 110 or 120 such guard-houses, and a by no means contemptible economy is effected.

A RUSSIAN SHIP CANAL.—Some attention has been directed in Russia to a project for a second connection between the Sea of Azof and the Black sea by a canal through the isthmus of Perekop, which connects the Crimea with the mainland. As now outlined it is proposed to build a canal 12 feet deep and 65 feet wide through the isthmus, with ports at each end. The object of the canal is to avoid the dangerous navigation of the Straits of Kertch,

GOOD HEALTH.

The Cancer Discussion.

EDITORS PRESS:—Having spent several years of my early professional life in a cancer ward of one of the largest hospitals of Europe, I am very naturally interested in the one-sided discussion of cancer now going on in your paper, which has accidentally fallen under my observation during my brief stay in your city.

My experience in the treatment of this disease had led me to the belief that no treatment had yet been found whereby the well-defined cancer, after a certain stage of development, could possibly be made to yield to the skill of the medical practitioner.

Like every physician of experience in the treatment of cancer, I had secretly admitted the force of the declaration of a certain distinguished physiologist of the last century, who said: "There are yet some diseases which medical skill hath not encompassed, and must therefore be placed among the incurables." This admission, of course, was not for my profession, but for myself, when left alone, in moments of secret thought. What other conclusion could a candid mind reach when cognizant of the universal failure to cure, which marks the history of this treatment at every step, whether it be in hospital or in private practice, both in Europe and America? In the Middlesex hospital of England alone, they have in the cancer ward 310 beds, with an annual average number of in-patients of 2700 and of out-patients of over 30,000. This proportion, all things equal, is the same in all the hospitals of the continent, and yet the entire medical fraternity is halled in a successful treatment of this disease. To stand at the doors of the hospital wards and witness the immense throngs of unfortunates who pass in, and the very few who pass out as cured, is to witness one of the saddest phases of human misfortune. Here it is more than at any other post of duty that the physician feels his ignorance and his professional hypocrisy in assuming to cure with the surgical knife. Here it is, if ever, that he bows to science and asks with fervent emotion for a new pathological revelation, for some substitute for the butcheries of the surgeon. Of course, the knife is the only accepted remedial agent at present throughout the world.

In some incipient cases it proves a success. And then again, the question arises here, whether the diagnosis after all in such cases may not be erroneous, knowing as we do the character of the scirrhus tumor? With my experience and observation, then, it is not strange that I should feel no small degree of interest in the assumed discovery here in this city of a veritable cure for this formidable disease. My surprise is, however, that the medical faculty of San Francisco do not investigate and ascertain the merits of this alleged discovery, particularly when so many evidences of truth exist in their very midst. I well understand the proverbial disinclination of physicians to depart from orthodox dogmas, and particularly the common disinclination of men to adopt the views of the so-called weaker sex, especially in matters of intellectual or scientific research.

But inasmuch as pathological knowledge still remains to a great extent in the domain of the experimental, it is due to themselves, as representatives of a noble calling and as ministers of benevolence to the race, that they calmly and considerately examine, without prejudice or jealousy, the alleged discovery in question. Because the successful treatment of cancer has thus far baffled the skill of the ablest practitioners of these and all former times, it does not follow that a specific has not now been discovered.

The eighteenth and nineteenth centuries are brilliant with discoveries involving the amelioration and the progress of man which put to shame the grandest achievements of the best intellect of all the former periods of our history. And because a woman is the discoverer of this alleged panacea, it does not follow that it is not a discovery which is destined to prominently stand out in the history of pathological triumphs. Looking over the intellectual and scientific fields of woman's labor, the candid mind must frankly admit that it is not alone for man that Genius has woven or twined all her chaplets and crowns. From the manger sprang the only moral philosophy that bears the seal of God.

From the ranks of the million have come some of the mightiest embodiments of inspired thought.

From the unwashed multitude are constantly stepping to the front those to whom the diplomas of the schools would add no luster. Sheepskins and oils are of human creation and are pleasing confirmation of personal merit. But neither Moses, David, Plato, nor Paul, Shakespeare, Sheridan, Herschel, nor Watt, Cromwell, Cullen, Davy, nor Burns, Washington, Lincoln, Clay, nor Grant, were ever honored with any certificate of merit from either priest, prelate or college president. Hence the claims of every disciple of science should meet with respectful consideration on the part of the conventionally anointed; for savans and Meselars are necessities in the great order of evolution, and may be looked for at any hour of the grand march and at points when least expected.

Therefore, neither dogma nor jealousy should separate or estrange the different schools of medical practice; especially for the sake of science and humanity, Allopath should shake

hands with Eclectic across "the bloody chasm," and so on down the full line of the schools. Truth often drops her pearls where dogma and arrogance little dream.

The pride of Judas saw no good that should come out of Nazareth. Socratic philosophy as embodied 2300 years ago would fall flat on the ears of Cambridge and of Oxford to-day. Had not Lincoln been led by a discerning and almighty Power over diplomats, sheepskins, and anointing vessels, the grandest character of American history would have been lost to the world. In conclusion, I will remark that acting in accordance with my faith, I have spent a portion of my brief visit to your city in investigating the discovery in question.

I do not regret it. I have done it profitably. I have caught a glimpse of a light which I hope may finally burst into a vast and luminous orb. I am satisfied that the assumption of a great discovery in the treatment of cancer has the appearance of being well founded. I have seen what cannot be seen in any part of Europe or America. I believe it to be a triumph for humanity and science. In its presence I stand again in the cancer wards of the Old World, holding in my hand a promise of hope to the hopeless. The medical faculty of the Pacific Coast should at once give it countenance and a respectful hearing. To reject it is to betray a dogmatism, a jealousy and a disloyalty to science and humanity that borders on criminality.

MEXICO ON THE WING.

LIME-WATER AND ITS USES.—Lime-water, when applied to suppurating or mucous surfaces, checks or stops secretion and produces dryness of the parts; hence it is a desiccant, and is useful in sickness and irritability of the stomach during teething. The power of exciting and changing the mode of action of the absorbent vessels and glands has been ascribed to lime-water, and probably with some foundation, for under its use glandular enlargements have become softer and smaller—in other words, it is resolute. It often relieves the superficial but painless ulceration of the mucous membrane of the mouth observed in dyspepsia. In these cases one part of lime-water to two or three of milk is usually sufficient. Given in this form, it will often stop the most violent sickness. In some scrofulous ulcers its power of checking secretion is most marked.

HONEY CURE FOR CHOLERA.—C. E. Willis contributes the following to the *Santa Barbara Press*: Dr. George Sowers, practicing physician in Socorro, has used pure honey as a specific for cholera for two years past, and has not lost a single case. He has had a large number of cases under his care, whole families being often attacked, and gives them honey, first, last and all the time and nothing else, for food or medicine. It is distasteful to the cholera patient, but is good medicine all the same. John A. Helphingstine, at present Superintendent of the Coronado Beach Company, San Diego, was long a resident of New Mexico, and reports that he has witnessed the wonderful success of this simple remedy.

HOW TO TREAT THE FAINT.—Old Dr. Gittings, of Columbia, S. C., being called to a lady who had fainted, found the patient stretched upon a sofa, with a high pillow under her head. The doctor's first instructions were: "Take that pillow from under her head and place the family Bible under her heels, and she will be all right in a minute." One who heard him say it has never forgotten this remedy, and has practiced it repeatedly with great success. Fainting is occasioned by lack of blood in the brain. When the sufferer is placed in the position described above, the blood flows back into the brain and the fainting fit is over.

USEFUL INFORMATION.

Important to Architects.

A question is asked in *La Semaine des Constructeurs* which is not infrequently heard in this country, and the French opinion on the subject is of interest to all architects. It seems that a proprietor invited estimates from a number of contractors for the execution of a monument, after plans and specifications prepared by his architect. The work was not carried out, and one of the contractors sent to the proprietor a demand for payment for his trouble in making the estimate. The correspondent inquires whether he is entitled to receive such payment. To this the editor of *La Semaine* replies, that the fact of the submission of plans by a proprietor to a contractor, and an inquiry as to the sum for which he will carry them into execution, does not legally imply any engagement of that proprietor with the contractor. The process is simply an ordinary consequence of the custom of competitive bidding. The contractor knows the risk, as well as the advantage, of responding to the invitation to submit an estimate, and he is free to do so or not as he chooses. If he chooses to make a tender, he can only do so intelligently by studying the plans, and this he does for the sake of making the offer, and not as a favor to the proprietor.

Another question of some importance is also answered in *La Semaine des Constructeurs*. It appears that a certain church was in process of construction or repair, under the direction of an architect who had made proper calculations, and had taken the necessary means for insuring the stability of the edifice after its comple-

tion. During the progress of the work certain centers, placed to support the arches temporarily, failed, and the building was injured. The point to be determined is, whether the architect or the builder should be held responsible for the accident. The reply to this is, that as a general principle, the contractor is alone responsible for defects in execution, and the architect for vices in the design. The contractor is supposed to know, better than the architect, the order in which the several portions of a construction should be carried out; he is expected to understand the modes of preventing injury or failure in unfinished work; he is constantly present, in person or by deputy, to direct the operations in progress, and is relied upon to watch effects and supply remedies. The architect, on the contrary, so far as regards his plans, is concerned only with the finished work, and if that is designed in accordance with the laws of stable equilibrium, his duty in relation to the plans is fulfilled. If, being present at the work, he should give wrong directions, he would have at least a share of the responsibility to bear, but in his absence the contractor is certainly bound to pursue his operations in accordance with the rules of his own art. For these reasons *La Semaine* decides that the contractor alone should be held responsible for the dam-knots, burls and other marks usually found on branches of trees. One in particular, representing a branch cut off close to the main limb, is very effective. With these screws, our man will take a little table or a chair and make a rustic concern of it in ten minutes. The device is not patented, and the man who gets the idea worked down into practice by the wholesale stands a chance of making a good thing.

FOOD ADULTERATIONS.—The chemists of the Agricultural Department, under direction of the Commissioner, have for a year been investigating the extent and manner of food adulteration practiced in this country. The report relating to spices and condiments is already completed by Mr. Clifford Richardson. It shows that of 20 samples of ground cloves only two were pure; of eight samples of cayenne pepper only one was pure; and of ten samples of mustard none were pure, though several had only suffered the loss of their fixed oil. Ten samples of allspice were examined, eight of which were pure. Four samples of cassia were all pure. Of ten samples of ginger four were pure. Only one out of 13 samples of black pepper was found to be what it purported to be. Two samples of white pepper out of five were pure, two samples of mace out of five were pure, and of three samples of nutmeg examined all were pure.

THE PANAMA CANAL.—An ex-official on the Panama railroad who recently returned to New York, states that it is almost impossible to describe the waste and extravagance which are going on along the canal. Engines, dredgers, excavators and everything of that sort, lie along the line of the canal very much as bones used to line the old wagon trail across the prairie. It looks like a woeful miscalculation to order machinery which cannot be used, and then let it rust in the rain and sun. The whole enterprise is covered over with red tape, and, in the midst of all the circumlocution, the money is lost by the thousands. There are first, second and third chiefs to each division, and they have a lot of assistants, so that when anything is wanted the order has to be checked and counter-checked by a dozen officials who draw big salaries and do nothing.

SUMMING UP the results of some 3000 special reports on industrial matters, *Bradstreet's* concludes that, in the region covered by these reports, about 27 per cent more hands were at work March, 1887, than in January, 1885. This study is confined to "industrial, mechanical and mining employes." The increase of wages in the same time has been 10 to 15 per cent, which seems to be just about the same as the reduction from 1882 to 1885.

SOFT SOAP with half its weight in pearlash, one ounce of mixture in about one gallon of boiling water, is in every-day use in most engineers' shops in the drip pans used for turning articles bright in wrought iron and steel. The work, though constantly moist, does not rust, and bright nuts are immersed in it for days, till wanted, and retain their polish.

THE Secretary of the Navy, Washington, D. C., has invited proposals from American ship-builders for building the Newark, a 4000-ton cruiser, cruisers Nos. 4 and 5, and gunboats Nos. 3 and 4. All of their parts are required to be of domestic manufacture, and the contractor is required to guarantee a maximum speed of 19 knots an hour.

SIMPLE TEST FOR GOLD.—Take a piece of flint and rub against it the metallic object to be tested, until the latter leaves a sufficiently marked trace upon the stone. Upon bringing the flame of a sulphur match in contact with the spot, the latter will remain intact if it has been made with gold, but will disappear if the contrary be the case.—*La Science en Famille*.

COTTON-SEED AND CACTUS FOR BEEF.—It is said that a trainload of 330 cattle, from Cotulla, Texas, which had been fattened on prickly pear and cottonseed meal, was lately marketed in Chicago. They attracted considerable attention, being the first large lot of cattle ever fed that way for market, and were sold at \$4.25 per cwt.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NEW LONDON.—Amador *Ledger*, April 30: A fine body of ore has been struck in the shaft of the New London, near Plymouth, at the depth of 950 feet. The ledge is over three feet wide, of blue ribbon rock, showing free gold, and carrying a heavy percentage of rich sulphurets. The principal owners are up from S. F., and are highly pleased.

MISCELLANEOUS.—Noah Bowman and F. M. Pense have struck a rich claim about 300 yards from Mace's mill. They have taken out several pockets. The ore is sprinkled with gold. The Plymouth Con. Mining Company of California will pay, May 5th, their forty-eighth dividend of 25 cents a share, or \$25,000, making \$125,000 paid this year, or \$1,950,000 paid to date. At the Kennedy, some extraordinarily rich ore was taken out last week. It was so freely charged with free gold that it was put in sacks and sent to the surface. Some five or six sacks were taken from the pocket. Jake Griesbach has sold his mine in Pioneer district to a party from S. F. The price paid is given at \$7000. The parties are talking of having the ore on the dump hauled to Pine Grove and crushed at the Dane mill. The test crushing of ore from the claim of Spagnoli Bros., near Clinton, was completed last week, and averaged \$12.11 per ton. S. D. R. Stewart has purchased the Summit mine, south of the old Eureka at Sutter creek. He intends to start work thereon as soon as he can make the necessary arrangements. There is a shaft 700 feet deep on the property, and this he intends to drain and sink deeper. A large Huntington roller quartz-mill has been shipped for the McKenzie Bros. to be erected on their mine near Irishtown, about six miles above here. Further particulars about the strike in the New London state that the ledge is from seven to eight feet wide, and contains a small seam of free gold-bearing rock that will yield at the rate of several thousand dollars to the ton. In the opinion of many it is thought to be the richest body of ore that has been struck in the county for years. It is the intention of the owners to put down another shaft, and also to erect a 40-stamp mill, which may be kept running while the second shaft is being sunk.

DRYTOWN.—Cor. Amador *Sentinel*, April 29: The claim of Ebe and Shoemaker, also that of M. Jorganson, on Dry creek, are on the same lead. Both claims have tunnels run to the depth of 400 feet. Mr. Jorganson intends to erect water-power hoisting works and sink a shaft during the summer. The Cosmopolitan, lately sold by Jennings and Nute to an Eastern company of which ex-Governor Hale, of New Hampshire, is the principal owner, have but two men at work at present running a tunnel; in doing so they have come across some old work done by Wm. Hooper in '54. The company intends to erect, during the coming summer, very extensive works. The old Potosi, which has been lying idle so long, has been bonded by Carrara and Mayden, who are crushing some very rich rock taken from a tunnel lately run by them just east of the old shaft. M. C. Randolph is trying to form a company to take hold of his claim, the Olive. The mill is not running now, owing to lack of machinery for keeping water out. The Loyal or Black Hills and the Gover still continue to pound out the gold.

Butte.

UNEXPLORED GOLD FIELDS.—Oroville *Mercury*, April 27: The *Mercury* has always contended that quartz and drift mining in Butte has never even been prospected. Evidences are constantly coming in of the truthfulness of this position. Through the hills around Enterprise, Mooretown, and Forbestown there are veins of quartz which certainly contain large quantities of gold. Whenever one of those ledges has been followed any distance, gold in fine paying quantities has been found. The same is true of the ridge from Bidwell's Bar to Quincy, and from Oroville to Big Meadows by way of Magalia, Inskip, Butte creek, and Humboldt valley. If there isn't in the near future a grand era in gold mining in Butte, we are badly mistaken.

Calaveras.

COPPERPOLIS.—Cor. County *Record*, April 27: Col. H. D. Ranlett has been here with D. L. Merrill, of Mokelumne Hill, to make an approximate measurement of the amount of water to be pumped out of the Union mine. This is to be done by a measurement of the vast amount of rock and debris found outside, to learn the displacement. The owners of this mine reside in Boston, and the proposed sale is to parties in England, recently visited by Col. Ranlett, and who say they can't purchase without seeing the mine, and that involves the cost and time of clearing it of water. The old pumps are not fit for use, so it is proposed to hoist it out with large buckets. A detailed report has to be made to the company as soon as possible of the *modus operandi*, a close estimate of the cost, and the length of time it will consume to accomplish the work. Then the company will decide whether to go ahead or drop the subject. The mine is 500 feet deep, divided into levels, with quantities of full grade ore yet unworked. Immense quantities of this copper ore were taken out and shipped to Stockton, in wagons, during the late civil war, at which time copper was worth from 40 to 45 cents a pound; it is worth now about 10 cents.

MURPHEYS.—Cor. Calaveras *Prospect*, April 29: Mining is still the main stay of our industries, and now that there is something more than chemical experts and broke pauper alloy capitalists coming among us we can reasonably expect that something may be done in the way of developments. Good mining men representing sufficient capital to develop a mine and perseverance to determine whether they have a mine or not, are daily coming among us. A group of three mines near here it is said have been sold to a San Francisco party, who will proceed to work at once. And still another party will be here in a few days to look at another valuable property. Mining and mills are being worked and some with good results in this and adjoining districts.

El Dorado.

COUNTY NOTES.—Mountain *Democrat*, April 30: Mining in the vicinity of Latrobe is looking up, and

there are indications of a rapid advance in mining matters in that section. Thomas Davidson, who for some time past has been busily engaged upon his mine just west of El Dorado, was in town early this week, getting the last few odds and ends together preparatory to starting up his property in full blast. He intended starting up the mill on Wednesday last. There is already a large amount of ore on the dump, and more being taken out. Messrs. Neff, Church, and others, proprietors of the El Dorado claim, have during the week been on a visit to their property near El Dorado. They are more than pleased with the prospects. The company is now running drifts and prospecting the claim with a view to determining just where the permanent workings will be located. The present hoisting and pumping machinery will soon be replaced by heavier works now on the Baltic property at Grizzly flat. The activity in mining circles was added to this week by the purchase of the Kelley mine, in Kelsey, and we believe also an adjoining property, by Supt. Pierson, of the Gopher Boulder claim. He comes prepared to do extensive mining developments in this county. Before long a number of properties spoken for by his company will be put in operation which will materially increase mining activity in this county. Messrs. Skinner and Swansborough, who have been operating a gravel claim above Newtown, recently, in washing out gravel, unearthed a seam of quartz running through bedrock. They immediately began opening out the find, which proved to be a good wide lead of decomposed quartz, between well-defined walls, showing a handsome body of ore, which has panned out remarkably rich from the samples already crushed. They have opened out the lead for 30 feet, and find it equally good throughout.

NEW MILL.—Placerville *Observer*, May 3: Some of the principal owners of the El Dorado mine, consisting of W. T. Garrett, J. H. Neff, Gen. W. H. Brown, T. R. Church and Alex. Badlam, visited their mine for the purpose of witnessing the starting of their new 10-stamp mill. The company having several tons of good paying rock in the dump, the mill will be kept running continually, and a large force of men will soon be employed. The La Planta tunnel is being run rapidly, and the first roof will be completed in a few days. Thomas Davidson is running his mine north of town, with quite a force of men. The mill and concentrators have been put in order. Mr. Morgan, supt. of the Valanta mine, has gone below to purchase a larger pump to be used in that mine.

Fresno.

HILDRETH NEWS.—Fine *Gold Miner*, April 29: Hardly a week passes but that some lucky find is made; while prospecting underground continues to improve our reputation, as nothing yet in the shape of a setback has been encountered, but development invariably means improvement. This is notably the case in the Francis-James mine, which a short time ago was nothing better than a promising prospect, but now acknowledged to be one of the finest properties not only in this district, but in the State. The shaft is 235 feet deep, with levels running east and west every 100 feet. The ledge is four feet wide and the ore high grade, with galena sulphurets to the amount of from two and one-half to three per cent. The Hildreth shaft is to be sunk 200 feet deeper in order to open up more stopping ground. Work in this mine has progressed very favorably and its value established. It is estimated that 450 tons of \$60 ore are now on the dump ready to be crushed, and the company is putting up concentrators and repairing the mill to put this ore through. The Abbey continues its steady work and regular hulsion shipments, and everything in the vicinity wears a prosperous appearance. A fine body of ore has been encountered in their northeast second and third levels. The condition of the Dahlonega mine is very flattering. This property is located in Fresno mining district, about three miles west of Hildreth, and is owned by Geo. W. Grayson, James R. Nicholson, O. D. M. Gaddis and Jack Morris, and is the extension of the much-talked-of Blue Streak mine that Haggin & Haywards own. The Dahlonega shaft is sunk on the ledge 100 feet with a four-foot vein in the dump, and lies in a contact formation containing very good ore and carrying about three per cent sulphurets. Robinson & Clark have put six tons of ore through their arrastra, and got a cleanup of \$240. The sulphurets, which are rich, were not saved. White Rock ore is now being hauled and crushed at the Abbey mill. The last rains exposed much ore containing free gold in the Mountain View ore dump. Many locations are being made in that vicinity. Mr. Wilson in a few days will start sinking the shaft, and employ seven or eight miners for that purpose upon his noted Wilson mine. The ledge is two and one-half feet between walls that contain two prospecting gouges.

Mono.

FROM SWEETWATER.—Bodie *Miner*, April 27: A. C. Raymond came in from Patterson district last evening in the interest of the Monte Cristo mine. He has purchased supplies, picks, shovels, and all that sort of thing. The first work to be done is to build a road from Cameron City to the mine in order to get in machinery for hoisting and milling purposes. The machinery is on the way, and this road must be completed in time to meet it. The building of this road is quite an undertaking in itself. Mr. Raymond started out a force of men to-day, and other bodies will follow to-morrow and hereafter.

BODIE.—*Miner*, May 2: Here at home we know that the Standard Con. is running 15 stamps and shipping bullion regularly. We also know that Captain John Kelly is again among us, and has been industrious in his group of mines all day. A revival of business in Bodie, anywhere in the near future, rests on what may be developed through the Lent shaft.

Nevada.

BANNER.—Nevada *Transcript*, April 28: Before the pay chute was lost, more than 20 years ago, the Banner mine produced in round figures over three-quarters of a million dollars worth of gold. Owing to the imperfect methods of working ores then, it is estimated that less than one-half of the royal metal in the ore was saved. After a period of idleness, work was resumed last fall on account of circumstances arising from the agitation of the Gold Bank tunnel scheme, and has ever since been steadily prosecuted. A short time since, splendid ore was opened on the 120-foot level, 75 feet north of the shaft, and picked samples of it assayed from

\$212 to \$380 a ton in gold, and in some instances as high as \$25 in silver to the ton. The ledge is from 20 to 22 inches thick, and the vein runs parallel to the old one. There is now between 10 and 12 tons of high-grade ore on the dump. This is regarded as a very important development. Work is being pushed steadily ahead at the Union mine, near the Banner. New hoisting apparatus has been recently put up. It is reported that some prospectors have recently struck a very rich stringer on the southeast corner of the Merrifield claim.

RICH ORE.—Nevada *Transcript*, May 1: O. Maltman has purchased from the lessees of the Banner mine 12 tons of ore, paying for it \$150 a ton on the dump. Some of the ore being taken out is estimated to be worth as high as \$300 a ton. They expect to get out 50 tons more of high-grade ore within a fortnight. Grading is being done at the mouth of the Champion tunnel for a mill. It will have a capacity of 20 stamps, but only ten will be put in at present. A shaft will also be sunk in the same locality, a good ledge being known to exist there.

Plumas.

GENESEE.—Cor. Greenville *Bulletin*, April 27: Affairs here in the mining line are somewhat on the boom. Ward creek promises to be lined with arrastras. There are three in active operation at present, and more in contemplation, with the prospects of the old Robertson mill waking the echoes in the upper part of the canyon, and the Genesee mill answering the same in the lower part. This latter is now working.

San Diego.

JULIAN DISTRICT.—Julian *Sentinel*, April 29: Mining operations in this district are now in full blast, and mines that have for years been running regular have increased their force, such as the Stonewall, Owens and Ready Relief. Many claims adjacent are being vigorously prospected, and work in taking out ore for crushing is going ahead, and the mining outlook was never brighter.

RED HILL.—The Red Hill mines, situated midway between Cuyamaca and Julian, have just been relocated by Mr. James Stratton and Governor Waterman, who have now commenced work on the claims sinking a shaft. These mines were formerly located by Mr. Stratton some four years ago, and at that time the ore being of a refractory nature, machinery could not be procured to work it satisfactorily, but being able to place the proper machinery on the ground, it is now thought a rich harvest is near at hand. Work will soon be resumed on the Richmond mine, between here and Banner, by the proprietors, Jas. Low and Thos. Lick.

Sierra.

SIERRA BUTTES.—Sierra *Tribune*, April 26: Forty-six miners have been discharged at the Sierra Buttes mine during the past week, but it is understood that their places will soon be filled again. A party of miners are about to begin operations in the Typhoon gravel claim near Alleghany. This mine was worked extensively in former years, and big pay was taken from it.

Shasta.

GOLD.—Shasta *Democrat*, March 27: Billy Conant brought down from the Uncle Sam mine another gold brick weighing 23½ pounds—the cleanup from a 12 days' run, crushing about 15 tons a day. Geo. McDaniels has a couple of fine prospects on Clear creek, about two miles northwest of Muletown. Another rich chute of ore was struck on the Uncle Sam mine last week, that surpasses in richness anything heretofore discovered on Squaw creek. The ore actually hangs together with threads of gold. The Shasta County Milling and Reduction Works, now being erected on the old Shasta road near the old Four-mile house, are rapidly assuming shape. This is a custom plant and will be of great convenience to miners.

LOST CONFIDENCE.—The most encouraging results are attained in milling the ore of the Lost Confidence mine at Iron mountain. Jas. Salle, the superintendent, is working the ore up to 93 per cent of the assay value, and the bullion is a little over 600 fine. The company is confident they can yet work the ore closer and produce finer bullion with improved apparatus they see is needed. Last week they shipped ten fine bricks to Denver, Colorado, and have over half a ton more bullion that will be shipped as soon as they get new and larger molds in which to run the bullion into larger bricks. This shipment of bullion tells the tale of the successful reduction of this base ore. The owners of the Lost Confidence believe they have enough money in Iron mountain to pay the National debt with.

PROSPECTING.—Shasta *Courier*, April 30: The amount of prospecting now going on in this county is astonishing, but much of it is superficial, merely surface scratching. Some parties knock off a chunk of quartz, and unless they see gold enough to make a watch-case, pass on.

MILL.—The Johnson Cannon Ball steam quartz-mill, a mile and a half north of Shasta, is running regularly and doing custom work on ore brought from mines near town. The results obtained show that the ledges about this place are good paying.

Trinity.

EASTMAN GULCH.—*Journal*, April 30: J. H. Fisher has completed the wagon road to his mine near Eastman gulch, intersecting with the Venecia Mine Co.'s road. The mill on the Venecia mine will be started up about the 15th of May.

Ventura.

NEWS FROM THE MINES.—Santa Maria *Times*, April 28: Mr. Ramie returned on Thursday last from the Piru mines. He says that beyond doubt the Piru mining district is very rich in gold and silver, that all the miners are jubilant over their prospect, especially Newton Nun, who has discovered and located a vein of quartz three feet in thickness, that is very rich in free gold. He reports very favorably on all the locations he visited, especially the Esperanza mine, owned by Capt. Harper and others of this place. He anticipates a regular mining excitement as soon as the weather and roads are favorable. Mr. R. reports many experienced miners coming in from Arizona and elsewhere, all of whom are well satisfied.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—Enterprise, April 30: On the 1400 level, the west drift from the

main south drift still shows ore of fine quality. This body of ore is doubtless the upward extension of the development made last January in winze No. 1 then being sunk below the 1400, and which is now being stowed out. On the 1500 level from the south drift, 200 feet from the Con. Virginia shaft, an upraise has been started. At a point 600 feet from the shaft two crosscuts have been started from the south drift; one, a west crosscut, is designated as No. 2, and the other as east crosscut No. 3. The first has been advanced a total distance of 43 feet, and the second a distance of 61 feet. The south drift from the Ophir 1065 level, which entered the Con. California and Virginia mine on its 1200 level, has now been advanced 62 feet in Con. California and Virginia ground. The usual shipments of ore have been sent to the Morgan and Eureka mills, and the average assay of battery samples will be fully up to that of last week.

SAVAGE.—On the 600 level the upraise in the ore body is now advanced 76 feet above the sill floor of the level, and the ore chute is completed up to the tenth floor. The winze in the ore body has been sunk 45 feet in fair ore, and is now 75 feet below the sill floor of this level. On the 800 level, No. 1 west crosscut from the south drift has been extended 45 feet in the quartz body. At this point they have put in four square sets preparatory to upraising in the quartz body. No. 1 east crosscut on this level (800) has been advanced 69 feet. They struck a flow of fully three inches of water in the face of this drift on Friday of last week.

IOWA.—All the work during past week in east and west vein and boulder drift has been in good gold-bearing rock. Grading for a mill has been started and will be pushed. All the machinery is expected here first of next week and mill will be in operation by the middle of May. A new tunnel has been started on level of mill through which the ore will be delivered at mill.

HALE AND NORCROSS.—Since last report the south drift on the 1300 level has been advanced 92 feet, where connection was made with the Chollar mine. At this point they have excavated and finished a large working station for that company, and have repaired and equipped the incline for a distance of 100 feet above this level.

OCCIDENTAL.—On the 90 level, in the lower tunnel, the north drift from No. 2 upraise was extended 15 feet; total length, 197 feet. East crosscut No. 3, 50 feet north of No. 2, was advanced 10 feet; total length, 23 feet. No. 2 west crosscut was advanced eight feet. All of these openings are in quartz of low value.

BALTIMORE.—On the 400 level good headway is making in cleaning out and repairing the old drifts. On this level there is much new ground that will soon be explored. On the 300 level an upraise will soon be started in the vein to tap the old 225 level. The drift on the 500 level has now about drained out.

CROWN POINT.—There has been some difficulty in regard to obtaining milling facilities, and meantime about 30 miners have been laid off. These, however, will be put to work again in a day or two at the extraction of ore. Meantime much ore is being opened out and put in shape for being taken out.

BEST AND BELCHER.—On the 1500 level east crosscut No. 1 was advanced 80 feet; total length, 590 feet. No. 2 was advanced 90 feet; total length, 554 feet. These crosscuts are in softer porphyry, showing clay. In No. 1 there is a little warm water flowing from the face.

MEXICAN AND UNION CON.—On the 1300 level the joint Union and Mexican drift running northeasterly was extended 22 feet. This drift is now 498 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 15 feet; total length, 387 feet.

CHOLLAR.—A considerable amount of ore is still being hoisted at the Sharon shaft on the croppings. A good deal of underground work is being done for the company by the Hale and Norcross folks, as will be seen by the report on the operations of the latter company.

SIERRA NEVADA.—On the 520 level west crosscut No. 9, from the north lateral drift No. 2, 160 feet south from west crosscut No. 1, was extended 65 feet; total length, 162 feet. The face is still in porphyry and clay that contains some quartz.

BELCHER.—There is still a lack of milling facilities, but this will be partially remedied in a short time, when more men may be kept at the work of ore extraction. A good deal of ore is being opened up at several points in the old upper levels.

YELLOW JACKET.—The daily yield has been increased from 160 to 200 tons since putting on the additional mill. Nearly all this comes from the 1300 and 1400 levels. Above these levels a large amount of prospecting is being done.

ALTA.—Work is progressing about as usual at the various points. A curious circumstance is the finding of some small streaks of coal in a sedimentary stratum that occurs about the 825 level.

OPHIR.—On the 1065 level west crosscut No. 1, from the south drift, was extended 30 feet; total length, 285 feet. This crosscut is showing a good deal of quartz of a promising appearance.

GOULD AND CURRY.—On the 300 level some good milling ore is being found. The work on this level is principally confined to running prospecting drifts and making upraises in the old stopes.

UTAH.—On the 472 level the north drift from the main west drift was extended 30 feet; total length, 566 feet. The face is in vein porphyry and clay of a favorable appearance.

ANDES.—A deposit of ore of very good quality has recently been found on the 240 level. It was about eight feet in width, and appears to be holding out very well.

SCORPION.—The east drift on the 300 level is progressing at the rate of 30 feet a week. It is in a mixture of quartz, clay and porphyry.

VIVIAN.—Ore that it is thought will pay about \$30 is now in sight in this Silver City mine. The last lot was worked at Pollard's mill.

JUSTICE.—A considerable amount of fair milling ore is still found in prospecting on the 250 and 310 levels.

HAYWOOD.—The Briggs and Thompson mills are still running on ore from this mine.

Central District.

LOCOMOTIVE.—*Silver State*, April 27: J. F. Clark, who owns the Locomotive mine in Central district, informs the *Silver State* that it is paying handsomely. He built a small mill, which is run by water-power, on the river, and runs it in the day-time only, crushing about three tons of ore daily. This pays a fair profit and gives employment to several persons. If silver was higher the mill and mine would be run day and night.

Lone Mountain District.

THE KING MINE.—*Tuscarora Times-Review*, April 29: From Mr. S. G. Weston, we learn that the crosscut from the bottom of shaft No. 1 has cut through an ore body 23 feet in width which gives an assay of 30 ounces in silver and \$5 gold per ton. The ore at that point is carrying more lead, and the indications are that at a greater depth it will turn to smelting instead of milling ore, as nearer the surface. The mine is owned by Edward Rielly and George Bliss, a well-known banker of New York City, and S. G. Weston, of Tuscarora.

Montezuma District.

LIVENING UP.—*Inyo Register*, April 29: Fred Mengel reports the old Montezuma district, in Esmeralda county, Nevada, as livening up to a certain extent. J. B. Stoddard, the agent in charge, has a large lot of ore on hand, which will be shipped to Reno for reduction. Work is being pushed on the mines, and a great deal of ore will probably be shipped this summer.

Morey District.

PROSPECTING.—*Belmont Courier*, April 30: Prospecting is being pursued systematically in the mines of Morey district.

Ophir Canyon District.

STRIKES.—*Belmont Courier*, April 30: Supt. T. A. Oliver informs us that two more rich strikes have been made in the Chicago M. & R. Co.'s mine in Ophir canyon, Nye county. This mine is gradually developing into one of the finest properties in the country. The concentrators are doing good work.

Osceola District.

CONSOLIDATION.—*White Pine News*, April 25: Duff Brown has high hopes of the future of Osceola, but thinks the days of her prosperity would be much nearer if a consolidation of all her quartz mines could be made, and a wealthy corporation induced to take hold of the whole enterprise. He has been working for that end all winter.

Rebel Creek District.

A NEW MINING DISCOVERY.—*Silver State*, April 26: Commissioner Stone is the proud owner of a one-third interest in the Centipede claim, recently discovered two or three miles from Snapp's station, on the Idaho road. A sample of the croppings of the lead assayed \$44.77 in gold and \$38.60 in silver to the ton. A few feet below the surface free gold is visible in the quartz.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, April 29: North gangway from the south end line, advanced 20 feet. The formation remains the same.

NAVAJO.—Winze on east vein, 150-foot level, sunk 15 feet. The vein continues about the same. Have commenced enlarging the pump station on the 350-foot level to make room for an additional pump, preparatory to receiving the water from the north end mines. The lower levels are filled, and the vein is within 12 feet of this level.

NEVADA QUEEN.—Have started drift from the 70-foot level of North Belle Isle at the line. It is 135 feet from the surface; 16 feet made since starting. Work of rebuilding hoisting works is progressing. Foundations for engine and reel will be finished to-morrow. Other parts of the works will be pushed as fast as material can be obtained.

Wild Rose District.

PARADISE VALLEY.—*Silver State*, April 27: For the week, milling ore produced and delivered to the mill, Paradise mine, 61,670 pounds; Wild Goose mine, 65,360; total, 63 tons, 1030 pounds. Average assay value, per ton, 36.34 oz. silver; 0.18 oz. gold. Mill run 188 hours and reduced 94 tons of ore and 63 tons blanket sweepings. Number of men on payroll, 97. Getting some good ore from the stopes in the upper level of the Wild Goose mine. The south drift, 100-foot level, continues to improve as we advance. The south drift, 200-foot level, looks more encouraging.

ARIZONA.

MOHAVE.—*Miner*, March 30: Messrs. Kennedy and Richards made a three-ton shipment from the Little Chief mine, at Stockton Hill, to our sampling works on Wednesday which worked over \$300 to the ton. The Golden Gate M. and M. Co. are making preparations to patent their millsite immediately. It is reported that the Peabody M. Co. has sold the Signal mine in Owens district for \$75,000. The mine joins the old McCracken. Mr. Dana, of the C. O. D. mine, had about 14 tons of ore run through the sampling works. The ore sampled 260 ounces per ton in silver. Gray Bros., of Stockton Hill, sent down two big lots of ore from some of their claims at that place.

CHANCE.—Considerable work is being done at this mine, the property of Messrs. Gage and Leach. Drifting from the main shaft is being done at 150 and 175 feet, and quite an amount of good ore is being extracted.

GRAND CENTRAL.—*Tombstone Democrat*, April 30: On the new double compartment shaft on the Grand Central, sinking was discontinued yesterday, and will not be resumed until the hoisting engine is in place.

SILVER THREAD.—Crosscuts are being run on the 200 and considerable stoping is being done on the 100-foot level. About 160 tons of ore have been shipped up to date for the month of April.

LUCKY CUSS.—The main product of this mine is being shipped to the Girard mill, while the manganese ore goes to the Charleston smelter. The mine is a steady producer.

JONATHAN.—Sinking in the shaft is being continued, while two drifts are being run along the vein, with encouraging prospects.

BOSS.—The shaft is down 280 feet, and sinking will be continued. Considerable ore has been shipped during the month.

MAINE.—This is turning out its usual ratio of good ore, which is being shipped to Socorro and

Pueblo, Blaett, Trozona and other chlorides are doing very well at the Mamie. The ore occurs in small seams, but it is very rich.

TRIBUTE.—Considerable development work is being done, and some ore extracted from the upper levels.

COLORADO

STRIKE IN THE BELCHER.—*La Plata Miner*, April 25: An important strike was made in the Belcher mine Tuesday, which bids fair to mark an epoch in the history of that property. It is the largest body of ore opened in the mine for over a year. For several months the lessees have been driving an exploring drift from a winze, between the second and third levels. After doing some 60 odd feet of work in barren ground, they suddenly opened up a body of galena heavily seamed with gray copper, and of a splendid grade. The streak averages ten inches in thickness, and is as solid and compact as it can be. A block of ground 150 feet high is above the level, and represents just that much stoping territory.

TUNNEL ENTERPRISE.—*Georgetown Courier*, April 29: That Georgetown is to have her share of prosperity in this bright and hopeful year of our Lord, 1887, our readers cannot doubt when they learn the magnitude of the work to be immediately undertaken by Hon. G. W. Hall for the development of the Leavenworth mountain mines. Immediately east of the Big Mill, on the C. C. road about a mile south of the town, Mr. Hall has already secured ample dumping ground, building room and the land necessary to inaugurate in a practical way his idea of running a tunnel through Leavenworth mountain, cutting well-known properties in its lateral course, and possibly projected to the Colorado Central mine, 4500 feet away, which vein it will cut 500 feet below the Ocean Wave tunnel level, or 250 feet below the deepest workings of the mine, passing 2000 feet below the apex of the mountain. The size of the tunnel is 8 by 7½ feet, and it is to be supplied with double track. As soon as the tunnel reaches bedrock the heavy plant of machinery will be in place, and the work will be prosecuted with Sergeant power drills and three shifts of men per day. This tunnel will cut the tremendous veins on the north slope of Leavenworth, hitherto almost inaccessible because of the deep slide, and will open up the gold belt that is now attracting the attention of Eastern capitalists.

IDAHO.

OPHIRVILLE.—*Murray Record*, April 27: Yesterday a *Record* reporter took a ramble to the arastras above town. At the mother lode the tub was grinding away as usual. A fine body of ore shows up in the breast of the Clark tunnel, as also the one above. A new tunnel has been started farther up the hill where the work is being done by contract. The Occident boys are running the two tubs of their arastra, reducing three tons of ore per day. The Treasure Box Co. is also running its tub, making a sum total of five tons per day, or say 150 tons of ore crushed per month, estimating \$50 per ton saved by the arastra process, and we know it has averaged far in excess of this sum. The yield of these three arastras by this crude method of reducing is \$7500 per month.

THE TYRANNUS MINE. under lease to Charley Davis, is working four men, who have been steadily employed all winter. The result of operations is about \$14,000 worth of ore on the dump.

THE GALORE.—The controversy over the possession of this property has reached an amicable settlement, and work has again been resumed.

THE KING OF THE WEST is looking better than ever before. Fourteen men are now at work—all that can be advantageously employed at present. New machinery for the mine has been ordered.

THE DOLLARHIDE MINE looks extremely well, and a fine quality of ore is being taken out. The property is now in good shape to produce a large quantity of ore.

THE KEYSTONE MINE, owned by Wm. Kirkham, has lately come into prominence and is earning a good reputation. The find in this property has given the greatest encouragement to owners of claims lying in close proximity, and prospecting will be earned on vigorously along the line.

THE CROCUS VEIN.—*Wood River Times*, April 27: Thompson, the foreman of the Crocus mine, came in yesterday, and reports that the ledge was cut into in the tunnel, a few days ago, and that although the drift is now in and over 20 feet there is yet no sign of the other wall. The ore is of high grade.

THE NAYAU MINE.—Foreman Thomas, of the Nayaug, is getting in his supplies and completing preparations to start up work next Monday, with a force of ten men. Mr. Thomas feels very sanguine of making a good record, as he has 300 feet of "backs" to start with.

OTHER SIDE MINING NOTES.—*Murray Record*, April 23: Work commenced yesterday on the Myrtle claim. Night and day shifts will be employed in drifting. On account of the extra flow of water this work could not be started sooner. The Black Hills claim will be a scene of bustling activity in a few days. Dan McGrath is piping on Montana bar. In Placer gulch the Miller claim is being worked by a day and night force. Gill Chinn and Ortiny are cleaning bedrock with good results. In Potosi gulch on the Heller claim they are driving the flume toward bedrock in the gulch and piping on the bar. Hall & Co. are working in a side gulch and doing well. Tom Shuster is cleaning bedrock and piping in American gulch, a tributary of Potosi, and is getting splendid pay. A day and night force is kept busy on the Galivan claim sluicing and cleaning bedrock.

ON UPPER TRAIL.—Nickerson & Co. are working six or eight men on the Nickerson claim. Carr & Co. have four men ground-slucing. Bankin & Co. are sluicing a bar and cleaning bedrock. On Prospect gulch, a tributary to Trail, Felton and Fisher are at work. They took out 14 ounces the first week, which is not considered much in that locality. On Beaver creek at the mouth of Bob Tail gulch, Malarkey & Co. are working Beaver bar. The adjoining claim, close to Scott's gulch, is being piped and is producing well. All the above mentioned claims and many others in that section

are well-known gold-producers, and while the water holds out a stream of gold will be pouring into the back at Delta.

AT SMOKY.—*Cor. Ketchum Keystone*, April 30: The improvement in the camp is not confined to one or two mines, but appears to be universal, and some of the claims barely prospected bid fair to develop into bigger paying properties than any of the best producing mines of the present. With the brilliant prospects of a busy and remunerative season before them, the miners and claim-owners are anxious for the snow to go. It is estimated that when work is fairly started there will be fully 500 men at work here within the radius of a few miles. From every quarter the news is of the most encouraging character. One of the most important of the late strikes is that made in the Carrie Leonard mine, one in the lower tunnel, the other above the Pot Wrestler location. The character of the ore in both these strikes is similar to that found in the Fourth of July tunnel of the mine, of a fine grade, and there is every indication of the new find developing into a great body of good-paying ore. The ore-houses are filled and the drifts piled up with ore waiting for shipment.

MONTANA.

VIRGINIA CITY.—*Cor. Inter-Mountain*, April 26: Guleh miners realize that they have abundance of water stored away in the huge banks of snow which crown our mountains, but are a little impatient at the indifference of the weather clerk in thawing it out. All the fluming companies are ready to commence operations, and the indications are good for a very busy season in the placer mines. Quartz mine trades which promised so much during the winter have come to naught by reason of the alien law. It is now understood that H. C. Foljambe, who had a bond of the Prospect mine, and who considered that he had the property placed in London, attributes his failure to the operations of this law. Late reports from Mr. Foljambe assure us that he has interested New York parties in our mines.

DIVIDEND.—*Inter-Mountain*, April 27: The Moulton has declared another dividend of \$30,000, making the twelfth to date, and aggregating \$350,000. The mine and mill are in fine shape, and there is a certainty of frequent dividends in the future. The Moulton is one of the best managed mining institutions in the West, and is a credit to the camp and to the Territory.

BLACK PINE.—A letter from J. H. Harper, who is over at Black Pine, reports that they now have four feet of fine ore in the east drift of the 100-foot level of the Oxide.

ORE.—*Butte Miner*, April 27: The Old Lexington mill will start up in a few days on ore from the Josephine and Sister mines. The work of putting the mill in readiness is rapidly going on; 225,000 feet of lumber was consumed in this camp last month, chiefly used in and about the different mines. The Morning Star sent home all their men last evening for the purpose of closing down. Pumps will be kept running two or three days longer in hopes that some arrangements may be arrived at as to further workings. When the pumps are hoisted, it will compel other mines on the same vein to pump or close down.

NEW MINING DISTRICT.—*Salt Lake Democrat*, April 29: A new mining district has just been discovered in Montana, not far distant from Lyon City. Rich samples of copper galena ores are coming from there to this city to be assayed. Some ores carry not only a very high percentage of copper, but also 60 ounces of silver, and specimens of galena, carrying 17 ounces silver and 70 per cent of lead, are also coming from there. New locations are being made, and all in that section are pretty much excited. The district will be known as the Vipond mining district.

JEFFERSON COUNTY.—*Cor. Butte Miner*, April 30: The Kit Carson mine, owned by ex-Governor Hauser, and superintended by Robert Gibbons, is well developed, and but very recently shipped seven tons of ore taken from a new level. The mass assayed by battery \$70,000. In this locality the ore carries gold as well as silver. Placers have been worked and prospectors are now handling the surface ground. Among the latest discoveries is one called the Georgiana, and owned by T. W. Noyes and partner. The shaft is down but 10 feet on a vein seven feet wide, carrying three inches of white talc on the footwall. The rich pay streak is about three feet in width, and assays into the hundreds very often, but generally goes but from 60 to 120 ounces. Adjoining the Georgiana is another claim, owned by Colonel Horst and one partner. This body of ore is evidently situated on a contact vein, but carries a different class of mineral. In all probability this portion of Jefferson county will eventually develop some of the richest properties on the Pacific slope. Very much prospecting will be done the present season.

THE CUSTER.—This valuable property, owned by Peter Pfeiffer and George Fitchner, is looking so favorable that the owners refused, a few days since, \$50,000 from a Helena syndicate. The syndicate are already heavy owners in this section, have invested over \$250,000, and are anxious to get control of all the valuable properties in the vicinity. The Custer is being pushed by tunnel and shaft.

ANACONDA.—*Review*, April 28: Our mining reporter got snowed in this week while trying to get up into Oleson gulch. Only a few miles above Anaconda snow fell almost continuously last week. Of course all mining activity in that vicinity has been temporarily suspended, and the prospectors have been driven in. Frank G. Brown, of the Blue-Eyed Nellie, reports that property looking finely and a full force of men at work. The ore is still being shipped to the Omaha & Grant smelter at Denver. In the mining district further above there is but little activity as yet on account of the deep snow. Silver lake is right in the heart of the snow country, and on that account there is nothing whatever being done in that region. The Cable mine is running, though the mill has been shut down for some time. It will probably be started up again in the near future. At Georgetown, the Pyrenes mine is working 22 men. They are in a fine body of ore. A sale of this property is contemplated. Salton Cameron is doing some development work on the Luxembourg, which is one of the most promising mines in the Territory. The Grubstake and other promising mines are still covered up in the deep snow. J. W. Gil-

lenden is working on the Contra Costa mine, which is situated on the hillside about 1½ miles south of Anaconda. He has a four-foot vein between well-defined walls. The ore is carbonate, and some specimens of it have assayed very high. The general impression prevails among mining men and men posted on mining matters that the coming year will be an eventful one in Montana mines, and that no district will come more rapidly to the front than that just west of Anaconda.

THE SMELTER.—During the past week the smelter and concentrator have both been running full, day and night. Marcus Daly is now in S. F., whither it is rumored he has gone to arrange plans about the putting up of smelting furnaces at the lower works.

NEW MEXICO.

KELLY.—*Cor. Socorro Bulletin*, April 25: The Kelly mine still sends out her usual quota of ore regularly. The Tip Top is in first-class ore, and lots of it. The Legal Tender is being worked by Mat Quail, under lease from Billing, and is putting out some very fine galena ore. The Greyhound is putting out some fine ore, and the sulphuret shows up in fine shape. The Yellow Rose is being worked by Robinson. He is driving a tunnel, and so far has crossed several veins of fine iron ore.

GOLD STRIKE.—*Socorro Bulletin*, April 30: Encouraging news of the gold strike in the San Mateo mountains reaches us as we go to press. The last consignment of Tip Top ore brought its owner over \$400 net for a carload. A gold strike in the Magdalena district is reported. The Quartz assays six ounces per ton, or \$153.60 per ton. The Magdalena district at this date possesses the following paying and producing properties: The Kelly, Juanita, Graphic, Greyhound, Review, Imperial, Caven, Ambrosia, Hardscrabble, Tip Top, Fashion and Legal Tender. At this time last year but three were yielding ore for treatment. McLeish and Reddy will recommence work on their Bonaparte claim in Jordan canyon the first of next month, and will continue to develop with a view of furnishing ore to our smelters. The Graphic group of mines, consisting of eight properties in the Magdalena, and of which three are now producing—the Graphic, Greyhound and Review—ship regularly to Socorro and afford the Graphic smelter of this city all the fluxing ore required, leaving large bodies of ore in the mines for future use.

OREGON.

SILVER CREEK.—*Cor. Bedrock Democrat*, April 27: The California shows good ore in five different levels and there are five men working in level No. 2, taking out shipping ore. Cable & Bro. will start level No. 6 in a few days and will also take out some shipping ore that will pay an average of \$250 per ton. On the Mother Lode, Taft & Co. are into the vein about 50 feet and are not yet through it. Assays of the ore body run from a few dollars to \$148, mostly in gold. Probasco & Co. are working four men and running a tunnel preparatory to taking out shipping ore. Mr. Louis Roll is working some mer. on his property and the vein he is exploring shows up well. Messrs. Taber & Swan, on Cracker creek, are now at work in their tunnel. The vein is large and prospects well in free gold. A large vein of hematite iron ore was located a few days since near Sumpter. Mr. Andy Elliott has commenced work on his placer mines just over the summit from Sumpter on the Granite road. At Sumpter, Messrs. Rimbo & Young are getting to work on their placer ground as fast as the ditches are free from snow.

UTAH.

SANDSTONE NOTES.—*Southern Utah Times*, April 25: The discharge of men every few days from the Wyman leachers is an unfavorable indication. At the Buckeye, everything is moving smoothly. The south crosscut on 600 is showing some fine ore and the 700 south is looking well. About two feet of ore has been struck at the bottom of the main incline, and indications point to the opening of a big ore body. Operations are being vigorously pushed in all workings, and the property is looking first-rate. The Banner mine, on the White reef, owned by Huntley, Morgan & Co., is developing into a splendid property; the main workings are a tunnel of 70 feet, which tapped the ledge from that point. A drift has been run south 40 feet and one north 25 feet on the ledge, opening a fine piece of stoping ground. A shaft has been sunk north of the tunnel, and at the bottom a drift south penetrates a fine body of ore of high grade. The owners are extracting but little ore, their plan being to thoroughly open the mine and put it in shape for more extensive operations.

ANOTHER SNAKE CREEK STRIKE.—*Park Record*, April 30: On Thursday a *Record* reporter was shown samples of rich silver ore carrying lead and a trace of gold lately found in Sunny Boy's group in Snake Creek district. The good-sized pay streak, which is identical to other Snake creek ore that has assayed way up in the thousands, was uncovered in the Silver Bell—the extension of the Columbia, at a depth of about 300 feet on the vein. This group of four claims is owned by Frank McLaughlin, F. J. McLaughlin and H. Hirschman, and considerable development work has been done on the claims. This find will add substantially to the promising future of rich Snake creek. The Crescent concentrator will be closed down till about the middle of next week, when ore shipments over the tramway will have been resumed. The run made by the concentrator has been most successful, all the old ore supply having been cleaned up. This month's work of the Marsac mill shows a larger and richer bullion product than for any like period before. The record of this mill, working on Daly ore, cannot be surpassed by any mill in this interior country.

ORE AND BULLION SHIPMENTS.—The Crescent shipped during the week 467,100 pounds of concentrates, but no first-class ore. For the week just ended the Mackintosh sampler received 43,510 pounds of Daly and \$77,390 pounds of Ontario ore; total, 620,000 pounds. On the 24th inst. the Ontario shipped 39 bars of bullion, containing 22,839.83 fine ounces of silver. To-morrow another average shipment will be made. Wednesday, the 27th inst., there was shipped from the Marsac mill six bars of Daly bullion, containing 6599 fine silver ounces, and to-morrow the product will be eight silver bars.

—IMPROVED—
**James Patent Economic Quartz Mill,
 ROCK BREAKER**
 —AND—
AUTOMATIC ORE FEEDER.

This Machine is now Superior to any, not excepting the Stamp Mill.

Manufacturers of Every Description of Iron and Steel Drop Forgings,

31 RICHARDS ST. (Near Hamilton Ferry),

BROOKLYN, N. Y.

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

THE FRISBEE-LUCOP MILL CO.,

Office, 145 Broadway, cor. Liberty St.,

NEW YORK.

HOOKER & LAWRENCE, Gen'l Agents.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and **GELATINE-DYNAMITE,** Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

Electricity and Ores.

We have several times mentioned the experiments which were being conducted by Dr. Rae, in the matter of saving quicksilver in the working of ores. The process has now passed the experimental stage and is being practically applied at the Douglass mill, at Dayton, Nev. The doctor's original proposition was to save 50 per cent of the present loss of quicksilver, and also to increase from three to five per cent the bullion product. At the Douglass mill the results of the work show a larger saving of mercury than this. The process was at first tried on tailings, but the last workings show it will do equally well upon ores. It may be stated that negotiations are now going on for the introduction of the system in other mills. The following letter from the superintendent of the Douglass mill gives the details of the run just completed:

DAYTON, May 2, 1887.

Dr. J. H. Rae—DEAR SIR: At your request when we started the full mill under the electric system I appropriated two pans and one settler to run separate, that is, to weigh in the quicksilver, and after working 100 tons (twice the amount worked on the test run) clean up thoroughly and weigh back, so as to ascertain the actual loss of quicksilver. No distinction was made in chemicals, tailings, or in working, only to keep the pans separate and distinct. This enables me to approximate very close to the work of the entire mill, 16 pans and 12 settlers. About 1250 tons have been worked to date; 117½ tons in the two pans mentioned, working day and night; amount of quicksilver used, 1935 pounds; amount received back, 1900½ pounds; loss of quicksilver on the 117½ tons, 37½ pounds, a fraction over five ounces to the ton, a saving of about 84 per cent over the old method; in other words, the saving of quicksilver used to date in the whole mill, 16 pans, has been over 2000 pounds. I would add that during the run the lower plug of the settler came out, letting a portion of the charges of the two pans run out into the sluices (which will be recovered in part in our blasket tailings) and would necessarily reduce even the small loss of 37½ pounds. I make the above statement as you requested all the facts, good or bad, and to give the system credit for the actual amount the scales showed. Taking into consideration the condition of our settlers (wooden staves, about 15 years old, and all of them leaking badly for almost the entire run), I think the results are extraordinarily good. The settler samples have been reduced over one-half, consequently the amalgamation is fully as good as on the test run.

I will append report of 14 56-100 tone Hindley ore worked and full return made. This ore was roasted in a reverberatory furnace and worked in ore pan as usual, and worked 94 14-100 per cent of assay value; entire loss of quicksilver, 3½ pounds, as against usual loss of about two pounds to the ton, and also saving gold to stamp to the amount of \$59, where we do not get enough to stamp by the old method, thus showing that the electric system will work equally as well, if not better, upon ores (especially gold ores) than it will on tailings.

You can use the above report as you deem best, and you may refer to me, if you wish, and I will be pleased to answer any such reference.

WM. A. RULISON, Supt. and Assayer
for J. M. Douglass & Co.

Mining Share Market.

Although mining stocks are rather quiet, it is said it has been a long time since there has been so much and such good ore developed and awaiting extraction at so many different points on the Comstock lode. In starting in for a low-grade proposition, some months ago—a proposition to work the mines for all they were worth—ore of high grade was brought to light in half a dozen places in which it was not generally known to exist. Deposits of high-grade ore are still being opened up, while at the same time the mills are being erected that were at first only intended for the low-grade rock. This low-grade ore is still in the mines, where it may be had whenever it is wanted, but in the meantime richer rock is awaiting milling facilities.

The following mining companies report having had cash on hand April 30, 1887: Consolidated California and Virginia, \$171,766.19 cash in bank and unsold bullion assaying \$111,622.94 on hand, inclusive of the shipment of \$77,474.03 made on April 27th; Ophir \$13,020.43, Mexican \$10,337.19, Exchequer \$10,896.91, Potosi \$9,814.50, Occidental \$8263.07, Gould & Curry \$9,808.93 and a balance of \$4542 to be collected on assessment No. 55; Sierra Nevada \$1775.49, Hale & Norcross \$2934.66, Best & Belcher \$20,167.57, Bulwer Consolidated \$8685.65, Peer \$9544.44, Peerless \$11,870.55, Crocker \$3000.63, Chollar \$6471.06, Crown Point \$21,640, Andes \$24,767.77, Alta \$4,153.33, Benton \$24,227.10, Lady Washington \$20,394.83, Union Consolidated \$2337.38, Independence \$8568.32, Navajo \$17,080.83, North Belle Isle \$45,826.21, Belle Isle \$11,377.13, Standard \$14,959.94, Kentucky \$1740.96. The following mining companies report having an indebtedness April 30th: Utah Consolidated overdraft at bank \$1872.37, less \$589.60 cash on hand; Savage \$43,854.62, Mount Cory \$20,071.29; Nevada Queen, approximately \$25,000.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Alice, April 29, \$30,300; Bluebird, 27, \$20,000; Moulton, 27, \$13,184; Alice, 27, \$28,720; Hanauer, 24, \$7075; Bannock, 27, \$1700; Hanauer, 27, \$2000; Hanauer, 28, \$3900; 30, \$1755; Bannock, May 1, \$2700; Hanauer, 1, \$3440.

New York Metal Market.

Telegraphic advices dated May 5th give the following New York prices:

BAR SILVER—94½c per oz.
BORAX—\$1.04½.
COPPER—LARK—\$10.40.
IRON—No. 1, \$22.00.
LEAD—\$4.30 @ \$4.35.
QUICKSILVER—53 @ 54c.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Quiet, spot closing at \$9.95 @ 10.00. Transferable Notices (Lake) issued at \$10.00 @ —. Transferable Notices (Chili Bars) issued at \$9.10.

LEAD—Quiet at \$4.25 @ \$4.30 spot. Transferable Notices issued at \$4.27½.

TIN—Quiet at \$22.50 @ \$22.60. Transferable Notices issued at \$22.50.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.

Australian Tin, \$22.60 @ \$22.75; Billiton Tin, \$23.10 @ \$23.40; Banca Tin, \$23.15 @ \$23.60; Baltimore Copper, \$9.00 @ \$9.25; Orford Copper, \$9.00 @ \$9.25; P. S. C. Copper, \$10.00 @ 10.25; Foreign Lead, \$4.75 @ \$4.80; Foreign Spelter, \$4.70 @ \$4.75.

MAKERS' PRICES—At tidewater. 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lough, Grade No. 1, \$21.00 @ \$21.50; No. 2, \$20.00 @ \$21.00; Grey Forge, \$17.50 @ \$19.00; Southern, Grade No. 1, \$21.50 @ \$22.00; No. 2, \$21.00 @ —; Grey Forge, — @ —.

To Those Visiting San Francisco.

The many readers of this paper who may contemplate a visit to the city would do well to stop at the American Exchange Hotel, it being so centrally located for merchants, farmers, miners, and mine-owners with their families, that we can safely recommend it to those who may be looking for a quiet, respectable and well-kept hotel. The proprietors, Chas. and Wm. Montgomery, have been long and favorably known as hotel-men, and the amount of business done is the best guarantee of the merits of the hotel.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. Look CAREFULLY AT THE LABEL ON YOUR PAPER.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearings,
coars or pulleys.

Power applied direct. Works Ore at Low Cost
More or less weight on Crushers as desired.

Very little friction. Beats other mac ines in reducing and
amalgamating ore, and costs less. All who have used this mill
recommend it highly. Splendid for low-grade ore on account of
low cost of working.

\$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 43 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.

Prices furnished upon application to JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our
IMPROVED
HYDRAULIC
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

Immigration and the Mines.

The whole State of California seems to have entered on an era of prosperity. The influx of population, first felt in the southern counties, is gradually spreading in all directions, and the vacant spaces are settling up. Lands which have long been valueless have come into the market, and others which have been cultivated for years have greatly enhanced in value.

It is not alone in the country that this progress is felt, but naturally all the towns and cities are improving, too. New towns are springing up, and buildings are going up on all sides. It is noticeable that nearly all the towns and cities of the State are making efforts toward improvement. Hotels are being built, gas-works erected, railroads built, sewerage systems laid out, water-works prepared, public buildings erected, and every preparation being made for more prosperous times.

It was only a question of time when the remarkable climate and manifold resources of California would be more universally recognized. Of course, we were, for many years, more or less isolated, but the building of railroads has brought us closer to older centers, and the people who have been living in climates where they have great heat and cold are realizing that California will be a more comfortable place to reside. And with this increase in population and settling up of the country, we may be sure that the mines will not be neglected. It is not to our credit that we have let the wealth at our doors lie so long undeveloped. Mines have gone begging for years, and our California capitalists have been readier to lend money for some one else to risk than to invest it themselves. Many have had an abiding faith in our gold mines, and their rewards will now come. Eastern people who have come into the southern part of the State have been quick to see the value of the mines down there and have invested in them. In some of the old districts that have lain idle for years, they have taken hold and are making money. When more of them come to the upper part of the State, they will take hold of the mines here, too. Those who have quartz properties will not have to wait much longer to dispose of them, if they so desire. Then, perhaps, when these mines become valuable, as Southern California lands have, we will all be surprised that we did not "see" it before.

THERE is a boom in mining circles at Tucson, A. T., and the merchants contemplate building sampling works and smelters.

FROM lack of room to store silver the local banks refuse to receive silver on deposit.

The Keystone Boiler.

The accompanying engravings are sectional views of the Keystone boiler, built by Cleveland & Hardwick, of Erie, Penn., for the sale of which the Jobna Hendy Machine Works, in this city, are agents. It will be seen that this boiler is a modification of the well-known marine boiler, so largely used in steamship service. To those who want a strong boiler, possessing all the advantages of the ordinary tubular boiler, without the troublesome task of setting it up, and the attendant expense of brick work, etc., this boiler commends itself.

The furnace is surrounded by water on all sides but the front. Its size is ample for the economical combustion of fuel. It has no brick supports to be a source of trouble. Being a re-

falls low enough to uncover the tubes and be dangerous.

A curved deflecting plate is placed in the back connection, to keep the hot gases from striking the door, and is readily removed for the ordinary purpose of cleaning, inspection, etc.

The return tubular feature of this boiler, in addition to its value in point of economy, affords such means of combustion being perfected in the back chamber, that the danger of sparks is almost entirely obviated.

The Keystone boiler is strongly made of steel of full thickness. The bracing and stay bolts are all ample for a working pressure of 100 pounds to the square inch, sufficient margin being allowed to compensate for the effects of use. They are tested under cold-water pressure to 150 pounds and calked under a heavy steam

Mining Bureau Field Work.

When the appropriation for the maintenance of the State Mining Bureau was made during the recent session of the Legislature, it was provided that a certain proportion of the money should be spent each year in field work. It was the case that most, if not all, the money had usually been spent in the museum and very little had been done toward obtaining practical information in the mining regions outside that relating to minerals. With his last, or rather first report, the new mineralogist made a beginning in this direction, by obtaining some facts relating to certain mines, but the limited time and funds at his disposal prevented any very thorough work.

Now, however, with a better appropriation, Mr. Ireland and the trustees have set to work in earnest and have employed competent persons to investigate certain questions, and the information will be published when gathered. Mr. Melville Attwood, the well-known geologist and pioneer gold miner of this State, has started this week for Nevada county, where he will make a study of the wall rocks and gold ores of that region, and gather information concerning the occurrence of gold in quartz. Mr. W. A. Goodyear is already in the field and is at present studying up the petroleum de-

posits of the State. He will gather data concerning the oil resources of the various counties. The State Mineralogist himself is investigating the building stones of California.

As fast as these subjects are completed others will be taken up and the information which is gathered will be published in the annual reports.

This is a very important matter and it is to be hoped that miners will afford every facility to the representatives of the Bureau in making their investigations. They do not, of course, desire or expect any information of a private character which will be detrimental to the interests of any individual. In examining mines they do not wish any information which the owners desire to be withheld. As there are very few "stock operations" in the gold mines of California as there are in the silver mines of other regions, there is really no reason why most of the mines should not be studied. The information desired is of a general nature and for the general benefit of the mining community.

IMMIGRATION is increasing again, but the percentage of skilled labor as compared with unskilled that comes across the Atlantic is falling off.

SAMUEL BAXTER, one of the oldest hydraulic miners in Nevada county, died last week.

SECTIONAL VIEWS OF THE KEYSTONE PORTABLE BOILER.

turn flue boiler, the heat, which in the ordinary form of portable boiler passes up the stack, in this passes through a second set of tubes, heating the water and not the stack. As will be seen, the second set of tubes return above the crown sheet. It is thus apparent that a good depth of water is kept over the crown sheet, and that the crown sheet cannot be uncovered until after the water has fallen completely below the upper set of tubes. This crown sheet, in addition to being well braced, is arched, this form affording strength. The tubes through which the flames first pass are four inches in diameter; the second set are three inches.

The water space around the fire-box opens into a large water space below the tubes. The seam being inclined, the tendency of circulation is to carry any sedimentary deposits toward the water space below the tubes. This water space, being unaffected by heat, the water is quiescent, and opportunity is given for mud, scale, etc., to settle where no harm will result from their accumulation, and from which point this detritus can be easily removed. The crown sheet being the hottest part, the circulation is greatest at that point, its tendency being to carry with it, to the less active parts of the boiler, all impurities in the water liable to form a deposit.

A fusible plug is placed in the back head at low-water line, to melt out before the water

pressure. The boiler is neat in design, compact and complete, giving large power within a small space. It is rated at 10 square feet of heating surface per horse-power. It rests upon skids for convenient handling. The ash-box opening only in front, does not drop hot ashes and burn these away. These boilers are built in various sizes.

THE PLUMAS TROUBLE.—The District Attorney of Plumas county, C. E. McLaughlin, has published a statement denying, on behalf of himself and his fellow-citizens of Quincy, that any acts of violence in connection with the excitement prevailing there over the hydraulic mining question were either committed or intended, as has been stated. The fact that the miners held a meeting about that time is admitted, but it is insisted that the proceedings were orderly and peaceable.

At the Silver Star mine, in Smoky district, Idaho, a 20-stamp mill, with 16 Frue vanners for concentration of ore, an air plant and hoisting works, will be built at once, which will entail an expense of fully \$60,000. At the North Star mine, on East fork, a complete 10-stamp mill, with eight vanners, is to be put up at a cost of \$15,000.

In April, over 600 flasks of quicksilver were shipped from Napa county.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EBS.

Some Remarks on Geological Theories.

EDITORS PRESS:—In a former article commenting on one which you had published from Dr. Stillman's book, I cited some instances to show that the acceptance of speculative theories as demonstrated systems was not confined to the "ignorant multitude." The newspaper press is premeditated to embody and manifest the essence of the general intelligence and culture of any particular section of country. The frequent, I may say the habitual, use of the word "silurian" by the press of this city recently, in connection with the "dollar limit" controversy, implies an unquestioned acceptance of the geological system of this time, in the same way that the use, on other occasions, of the terms "natural selection" and "survival of the fittest" does that of the Darwinian theory of evolution.

The latter is based on the assumed truth of the former. The science of geology, as now taught, has for its basis the assumed truth of three cardinal principles, namely: the immobility of the ocean level, the instability of the land level, and the original existence of all aqueous rocks in horizontal strata.

In maintaining these principles, geologists are now placed in a predicament similar to that of astronomers during the reign of the Ptolemaic system. That system was based on the assumption that the earth was an immobile body occupying the center of the universe, having the sun, moon and stars all to revolve entirely around it once in 24 hours. The extreme absurdity of such an idea is now apparent to all persons of ordinary intelligence, yet that same idea held absolute sway in the scientific world for more than 1000 years immediately preceding the time of Copernicus and Galileo. During that period as the observations of astronomers became more exact, it became necessary for them to invent a system by which they might explain the apparent inferior motions of heavenly bodies distinct from the superior one around the earth. In this way they multiplied their "eccentrics, cycles, and epicycles" to such an extent that the study of the science had become a subject of inextricable confusion. Alfonso, King Astronomer of Castile, at one time remarked that "If the Deity had done him the honor to ask his advice before creating the world, he could have told him how to make it a little better, or, at all events, more simple." "He meant to express how unworthy this complication was of the dignity of nature."

Geologists of this time, like astronomers of the time in which Alfonso lived, instead of correcting false principles by deductions from newly observed facts, then reasoning constantly, aim at twisting facts into conformity with assumed principles. For instance, they have assumed that granite is an igneous production—first formed of all the rock—the backbone of the earth. Furthermore that there have been deposited on the granite everywhere a uniform system of aqueous formations, numerous, distinct and identifiable, amounting in the aggregate to an average thickness of about 10 miles; therefore, when in any particular region the upper portion of the series according to their classification is wanting, in order to maintain their principles, they resort to the expedient of assuming that the missing portions have been removed by denudation. In his Voyage of the Beagle, Darwin says: "Throughout the coast of Brazil, and certainly for a considerable space inland, from the Rio Plata to Cape St. Roque, lat. 5° S., a distance of more than 2000 geographical miles, wherever solid rock occurs, it belongs to a granite formation. * * * Can we believe that any power, acting for a time short of infinity, could have denuded the granite over so many thousand square leagues?" This statement of Darwin's, presuming it to be true, proves either that the system of formations is false, or else that a depth of rocks, about ten miles in thickness over the extensive area specified, has been entirely removed by the action of water without filling up the adjacent sea. The latter proposition is a palpable absurdity. Geologists assert the impossibility of the land surface of the globe, having been, all of it, at the same time beneath the surface of the ocean, yet observation teaches that every explored portion of it has been at some previous time in that condition. They get over that difficulty by alleging that the different sections of the land have been moved up and down alternately, somewhat after the manner of seasaw. There is a surface formation which in geological parlance is termed "The Drift." It occurs on all explored portions of the earth's surface, whether it be in the tropical, temperate or polar zone. It was unquestionably produced after the land had attained the general conformation and elevation which exists at the present time. There is a difference of opinion among geologists as to whether it was produced while the surface was beneath the water or beneath a universal covering of moving ice not less than one mile in thickness; but there is one fact which of itself proves conclusively that it could not have been produced by such an ice covering. There are found in it numerous animal remains, the skeletons being frequently entire. Such a mass of moving ice must have ground to powder

everything of that nature beneath it. It presents everywhere such similarity of characteristics in all respects as to prove its contemporaneity in all parts of the earth, consequently the seasaw expedient will not serve here, for the water must have risen above all of the land, or else all of the land at one and the same time sank beneath the water, and subsequently emerged without change of contour. The latter is a mathematical impossibility, while the former is only a conjectural one. Then again there are found in the drift numerous fossils of tropical animals buried in polar regions, and vice versa, those of polar animals now buried in temperate regions. Geologists attempt to explain these facts by alleging a temporary change of climate, adapting it for the time being to the constitutional requirements of the animals then inhabiting there. But there is another fact not so conveniently adjustable to theory. There are found lying side by side in the same bone-bed fossils of the extreme polar and tropical animals. I have no knowledge of any geologist or paleontologist ever attempting an explanation of this fact, and I challenge any local savant to give a logical one, in consonance with the principles of geology as now taught.

JUSTIN CHENOWETH.

San Francisco, May 7th.

Gold in California.

(NUMBER 3.—CONCLUDED.)

[Translated for the MINING AND SCIENTIFIC PRESS from *El Minerio Mexicano*.]

"Gold in the hands of a tyrant gives vertigo to society before corrupting it. It is only when gold is gained under the auspices of light and of liberty that it is legitimate and profitable; because, then it is transformed into progress, moral and intellectual."—*De un manuscrito Chileno*.

It is very difficult to ascertain the

Etymology of the Word Gold.

We know that the Egyptians gave the name *orus* to the star of day, to which they were offering their devotions. The color and brilliancy of gold led them to believe that it was produced by the sun, and hence they gave the same name to the precious metal as they had given to that star. Transporting ourselves to Greece, we there find among that people the metal of which we are treating called *aurus* or *auror* (auros or auron)—hence *thesaurus*, or treasure. All the writers of antiquity speak of gold—it may be now in a page of history, and again in their innumerable anecdotes and pictures of customs.

What poet, in his inspired or ecstatic verse, has not transformed the curls of the object of his enchantment into threads of gold? Of what eloquent man has one not said that his words were of gold? In the Bible, passages are frequent which evince that gold was known to the Israelites, and that they applied it in a variety of ways. The Egyptians, the Indians, and the Chinese have possessed this precious metal since the historical period. Homer says that the Greek princes were served from dishes and vessels of gold. Diodorus relates that Jayes, saved by a sailor, gave him a crown of gold, and afterward had him beheaded. Pliny says that Demosthenes had a gold ring which contained a very active poison. Hernan Cortez assures us that the natives of Mexico possessed gold and made vessels with it, and adds, that the city of Cholula was celebrated for the manufacture of jewels. Gold, in those remote epochs was

Employed in Objects of Luxury.

And was applied to domestic uses as well as to the decoration of palaces and temples. It is beyond doubt that our ancestors received the most pleasing impressions from and committed the most horrible crimes for gold. The part, then, which gold has played in the first evolutions of humanity has been considerable, and only the indefinite modifications through which the glorious societies of the future shall pass, will limit or annul its influence in the customs which inexorable progress may impose.

The lands and the rocks are

The Treasure of Nations.

In them it is that gold is found intercalated, from the smallest particles to the largest pebbles or kernels. Gold has also been found in vegetable ashes. But if its dissemination is extreme in the terrestrial stratum, the points are few where its accumulation is sufficient for lucrative extraction, in the actual state of the sciences, of civilization and of the difficulty in obtaining capital. After all, but few are the nations that extract gold from their territories, although every one should be able to do so, and always with some profit. Gold almost always presents itself in nature with the same color, aspect, and properties that we know it in money, jewels, and other objects of use, social and domestic. The chemists and mineralogists have given the name native, to gold in that state. The native gold is far from being completely pure, and does not become so until it has passed through the crucible of the chemist, which deprives it of the impure substances that accompany it. In every case

Native Gold

Contains almost always a small proportion of silver which varies from 5 to 15 per cent. Pure gold is a little harder than lead, which is equivalent to saying that it is very malleable. Neither air, fire, nor water alter it. From these properties and conditions it has received the name precious metal. We have said that gold is not

altered by fire; we make that statement, however, as a fact which is verified under ordinary circumstance and not when chemistry unfolds all its forces and concentrates enormous quantities of heat on a single point. In fact, with a temperature of 1100° of the air thermometer, gold is fused, and is volatilized at more elevated temperatures than are known to us. Among the most

Interesting Experiments

Which Monsieur Deville, our eminent professor, and the discover of the principal properties of aluminium, has shown, is the sudden transformation into vapor of a piece of gold by means of oxygen and hydrogen gas under the blow-pipe. Gold, like platinum and iron, has the property of soldering without having been fused. We say that the precious metal in the earth is not found pure. Thus it is, that in Mexico, it is allied with sodium; in Brazil, with platinum, and in California with tellurium and iridium. One of the most surprising physical properties of gold, is, that it can be reduced to leaves so fine, that their thickness will reach 1,100,000 millionths. The ductility, or it may be the property, which the metals have of being reduced to slender threads, is seen in gold, that with one ounce, a thread 26 leagues long may be made. This yellow and brilliant metal, is, after platinum, the densest body known, being 19.5.

We have said that gold is

Found in the Sands.

The rocks and the earth in a metallic state and with its characteristic yellow color. Its species is determined by submitting it to the action of certain chemicals. Sulphuric, nitric and hydrochloric acids do not modify the state of the gold when the assay is made with one only; but if the last two be mingled, an *aqua regia*, as the chemists call it, is formed, to the action of which, if the gold be exposed, it will completely disappear. If to the regia solution of gold is added a solution of oxalic acid, or, better, a sulphate of protoxide of iron, all the gold is transformed into dust, and deposited. Although the gold so treated becomes lusterless, its color and brilliancy may be restored by friction.

The operations indicated are not to be confounded with, 1st, the yellow alloys; 2d, the pyrites of iron and copper; 3d, the yellow micas. Gold might be extracted from some bodies which form with other bodies in certain combinations, if those were abundant. Unfortunately, this seldom happens, and it may be said that outside of the pyrites of copper and iron, generally decomposed by atmospheric agents, the other auriferous minerals present many difficulties when an effort is made to deprive them of the gold they contain. The magnetic and

Aureolical Pyrites

Are sometimes very rich, but hardly yield 30 per cent of their gold. Upon this question of the auriferous and complex pyrites, the metallurgists have made innumerable assays, with the object of an easy and economical method of extracting gold; but the attempts have not compensated their efforts in a satisfactory manner. In Hungary, a case has resulted in an arseniuret of iron calcining the metal, and a current of chloride being worked afterward upon the product obtained, the chloride of gold formed was immediately dissolved in the water, and finally from this solution the metal was precipitated by sulphureted hydrogen; but the problem has not been completely solved. We learn, however, that in the United States efforts are being made to apply this method. In the School of Mines of Paris they are likewise engaged. The galenas are other sources from which gold is drawn in certain cases; but its extraction is best effected by indirect operation. Thus, that which is most frequently done, is to melt them, in order to separate the lead, which is almost always argentiferous; afterward, the refining isolates the silver and the gold; lastly, by nitric acid, and at present by sulphuric acid, the silver is dissolved and the gold remains completely separated. A mixture of marine salt and any flux whatever may be employed in place of the acid, which, being put in a crucible with the alloy of gold and silver and submitted to a high temperature, leaves the gold on the bottom, and the silver is converted into chloride; from this chloride the extraction of the silver is easy by means of mercury and by direct fusion if desired.

MONTANA AND MICHIGAN COPPER.—In an article commenting on a statement in the *Marquette Mining Journal* that the Anaconda Company were to build a \$2,500,000 reduction plant at Duluth, the Butte (A. T.) *Inter-Mountain* has the following paragraph: But there is a lesson conveyed in this tirade of the Michigan copper organ, and it is this: There is going to be a long and costly conflict between the Michigan and Montana producers. It may be a conflict wherein only the fittest will survive. In this view of the case every consideration of self-interest points to the fact that the labor and capital of Butte have a mutual interest in making the fight to win. With a hold and solid front the common enemy must be met. There will be plenty of time afterward to settle personal differences. The workmen of Butte are just as directly interested in the outcome of the battle as are the men who own the copper mines and smelters. It is evident that the Butte companies have no connection near or remote with the Duluth enterprise. Such a scheme would be at once destructive and idiotic. The war, if war there is to be, is between the Butte and Michigan producers, and

the battle-ground in each case will be at home. It will be a contest to the finish, if that is the way the peninsula people want it, and it seems they do. The Butte forces are now well-equipped with abundance of ore, snapper machinery and a fair market. Our troops consist of 3000 stalwart miners, full of industry and hope, and with a loyalty to the home cause which no discussion can impair. Upon these troops depends the issue. Their interests are identical with those of the employing class, and when the Boston millionaires undertake to run them out and capture the market they will find foes far more than worthy of their steel. If the war is inevitable, let it come.

The Mining Outlook for Calico District.

Deputy Assessor H. B. Stevens, while visiting the mines to assess property, says the Calico *Print*, has had an excellent opportunity to ascertain the general condition of the camp, and, being familiar with every part of the district, owing to his extensive experience in prospecting and mining, his opinion of the outlook of the camp is important and reliable. He says that there are about as many miners, and probably a few more, employed in the camp, including the mills, as there were a year ago, before the King mine closed down. There are not quite so many employed in regular mining for the companies, but the deficiency is counterbalanced by a larger number of chloridiers than were engaged one year ago. Considerable progress has been made in the camp during the past year, and the outlook is brighter than ever. West Calico has made rapid strides, and several mines are coming into prominence. The group of mines, of which the Waterloo is the center, has given indisputable evidence that it contains a vast amount of mineral that will yield large profits to its fortunate owners, and for years will be one of the principal supports to Calico. The Barber Company is making thorough and considerable developments in the Total Wreck group of mines, and it is their intention, as soon as they extract efficient ore to warrant it, to erect a smelter near their mines, and if the present appearance of the mines continues, the works will be built this fall. There are a number of mines in Calico and adjoining districts to keep a smelter in constant operation on haec ores, including the Cleveland, which appears to be a veritable mountain of silver and lead. In fact, that portion of the district called West Calico, which is bounded on the east by the deep and tortuous Wall-Street canyon and on the west by the valley, is a prominent ridge two or three miles long, which is a vast deposit, or rather, innumerable deposits, of gold, silver and lead, which will require hundreds of men to extract its immense wealth, and scores of stamps and a large smelter to reduce its ores.

Considering the amount of prospecting done on this mountain ridge, the showing is splendid, and there is sufficient evidence to warrant the belief that the grandest results will follow the efforts of skilled labor, directed by enterprising capital. The group of mines on the well-known mineral belt between the Bismarck and Garfield anyone are in a most flourishing condition, new finds and new strikes being made almost daily. The mines in the Garfield and Silver Odessa groups have attained considerable depth, and are honeycombed with thousands of feet of drifts, tunnels, winzes and shafts, and keep 30 stamps dropping almost incessantly. The forces of man are being continually increased and developments progressing with greater energy than ever before. Such mines as the Comet, Pinto, Little V, Invincible, Bismarck and Home stake are attracting unusual attention on account of the numerous and frequent rich strikes that are being made by the chloridiers, and a score or more of men who recently commenced mining with only a grub stake are now the happy owners of thousands of dollars, and their energetic labors have exposed to view many thousands of dollars more of ore, and elevated to a position among paying mines properties that were a few months ago considered prospects of a dubious value. The chloridiers delving in the sides of the King mountain and those east of Garfield canyon are meeting with success, as a general rule, and are swelling the hullion output to a considerable degree. The splendid results now being accomplished by chloridiers are due to the experience that many of them have had in mining the peculiar kinds of rock prevalent in the district. Before they became familiar with the nature of the various formations, failures were the rule and successes the exception; now the order is reversed, and the skilled, experienced and business-like miner never fails to make good wages and often a handsome stake.

ENJOINED FROM SELLING WATER.—Thomas Cloke, administrator of the estate of John P. Hickey, deceased, to which the Cedar Creek Canal belongs, which supplies a portion of the mines of the Dutch Flat district, Placer county, has been enjoined from selling water for mining purposes, when it is to be discharged through nozzles. The effect of the injunction, if it holds good, will be to prevent all gravel mining in that section, not even permitting the use of hydraulic nozzles in cleaning bedrock, which is not hydraulic mining in the sense understood by miners. A case will be made on this injunction which will be carried to the Supreme Court of the State.—*Grass Valley Union*.

Carpenters Here and Abroad.

We gave, in a late issue, some account of the differences between the condition of shoemakers in this country and those of Europe. We give below a similar comparison between the carpenters in the two localities, obtained from the same source:

The carpenters of the United States enjoy a great many privileges unknown to the European artisans, and occupy a social position much higher than do their English cousins. It is a poor carpenter in America who cannot make three dollars a day, while abroad finished workmen hardly get that sum a week. A comparison of the carpenters of the United States and the carpenters of London serves to show how much higher in the social scale are the American workmen.

There are about 20,000 men in London who make their living as carpenters and joiners. Of these, nearly 5,000 are inexperienced workmen, and are not allowed to belong to the various trades organizations, toward which the spirit is very strong. There are two large trade societies in London. The Amalgamated Society of Carpenters and Joiners is the larger, and at present is composed of 3,000 members in London and 26,000 in other places in the kingdom. Next is the General Union of Carpenters and Joiners. This union has 1,000 members in London and about 6,000 throughout the kingdom. Thus it will be seen that only about one-third of the workmen are trade-unionists, partly because the unions are for insurance as well as for trade purposes, so that age and other restrictions keep out many who are in sympathy with the union. Expert carpenters in London do not get half the wages of American carpenters. There are few carpenters here who will work for less than 30 cents an hour; there are equally few in London who get more than 18 cents an hour.

The regulation hours and pay—that is, 52½ hours a week, at 9d. an hour—are quite generally enforced all through London, although some few firms get more and give less. Uniform pay has brought out another class of carpenters who are not benefited by the uniformity. These are the unskilled workmen, who are paid all the way from 3½ to 7½d. an hour. There are very few apprentices in London, as neither masters nor men like to be bothered by having them around. This system has not yet forced the importation of German skilled mechanics, which importation must in time necessarily follow, as it has in other trades in which apprentices have been done away with.

The social condition of most London carpenters is deplorable. Few have any means at all of comfort or enjoyment, and, more than that, there is a lamentable lack of the necessities of life. They live, ordinarily, in a few rooms, for which the rent averages from \$2 to \$4. Taxes are paid by the landlord. To help out, the children are put to work as soon as old enough, and sometimes as much as \$10 a week is added to the family purse by this means. These families ordinarily breakfast on bread and butter and tea. Dinner depends largely upon the estate of the family purse.

In hard times all money must go for food to keep the man strong and well, so that the wife and children are frequently obliged to make all their meals of the same monotonous diet. The carpenters, when working right along, make about ten dollars a week, but out of this sum must come reductions for the 16 compulsory holidays that occur during the year; they, however, average about six months of work. Of course, some carpenters save money, and eventually become foremen. Some keep a small store in connection with their trade, and thus accumulate money. On the other hand, some sink into utter wretchedness, thus making the average condition lamentable.

The Parisian carpenters are much more intelligent, and their social condition is much higher than that of the London carpenters. Their number is daily decreasing, owing to the introduction of bronze and metal cornices and other constructions that were formerly made of wood. The tendency is very strong for secret societies. The most important is the fraternity of *Compagnons du Devoir*, or *Compagnons Passant*. The different degrees of the order are designated by the names of animals, such as the wolf or dog.

There are no engagements between the workmen and the bosses. The *patron* can dismiss his workmen at any time he pleases without any notice whatever, and the workman can put his tools on his back and knock off work also at any time without giving notice. However, when the *patron* dismisses the workmen he must pay the latter the entire day's wages for the day of dismissal.

Wood is so dear in France now that a builder can import his doors and sashes from Germany cheaper than they could be made at home. The carpenter lives decently, however, and while much below the plane of the American mechanic, he is much above the London workman.

Probably the best situated workman as regards work and wages, and the most discontented and distrustful of all, are the German carpenters. Most of them are socialists, and on elections they vote solidly for the red candidates. As there is considerable building going on in Berlin now, there is plenty of work and wages are fair. They live comfortably as a rule, although some of them are in poor circumstances. The average German workman is not happy unless he has at least one strike in a year, and more are frequent. Political trades unions have been suppressed by the Government, and now the majority of carpenters belong to the great Carpenters' Association, which numbers more in membership, probably, than any other existing trade union.

WORKING ORE BY THE RAE PROCESS.—Mr. Wm. A. Rulison, superintendent and assayer for the J. M. Douglass mill, at Dayton, Nev.

SCENES IN THE GRAND CANYON OF THE RIO GRANDE.

ada, writes us as follows: We have just completed a run of nearly 15 tons of ore from the Hindley mine, Garfield district. The ore was roasted and chloridized. We used 101½ pounds quicksilver and received 1008 pounds back, showing a loss of 3½ pounds of quicksilver on the run, which is about the amount which would necessarily be lost in handling that amount of quicksilver over as many times as the above was handled. The usual loss by the old method would have been from 30 to 35 pounds.

ENGLISH COKE has been scarce for some time, and not long ago the price was advanced to \$22.50 per ton. This attracted shipments from Tacoma, which sold at \$16 per ton. Following this were fresh importations of English, and the market dropped to \$16 to \$17. This will be good news to Pacific Coast smelters, most of whom use this English coke.

THE four-masted ship Ocean King sailed for San Pedro from Nansimo April 27th, with 4,000 tons of coal, the largest cargo ever taken from British Columbia.

THERE is quite a little excitement up around Sierra City. The Young America and Sierra Buttes mines are running full-handed and doing well.

The Decay of Canals.

One by one the great canal systems of the United States succumb to the competition of the railway and locomotive. They served their purpose as channels of internal commerce successfully for a time, but their period of real prosperity was short. Scarcely had the Erie canal, which was the first and most successful of these artificial water-ways, been completed, furnishing a commercial highway between the seaboard and the rapidly developing West, says the Philadelphia Times, than George Stephenson's Rocket demonstrated that the iron railway was to be the highway of the future, and the ambitious and expensive canal enterprises which followed close in the wake of the Erie canal were scarcely completed when they were found to be of little more utility than the stagecoaches and freight wagons they had them-

ground was finally broken, the President himself, with coat off, in true American style, thrusting the first spade into the earth at the opening ceremonies on the Fourth of July of that year. The work progressed more or less vigorously for a period of 22 years, the canal being finished in 1850, at a total cost of \$11,000,000. At first it was profitable, being the only outlet for the Cumberland coal. But soon the Baltimore & Ohio railroad was built, through its more perfect eastern and western outlets, to deprive the canal of its profitable monopoly of the coal-carrying trade, and its prosperity began to wane. It suffered still farther from the corruption and wastefulness attendant upon political management. From these combined causes it has got in such a bad way that its president, in his last annual report, says that the canal cannot be longer continued without aid either from the State of Maryland or the General Government.

The last resort of the owners and projectors of outdated and unprofitable canals, whether State or corporate, is to appeal to Congress to take the bankrupt concerns off their hands and spend untold millions in the impossible attempt to make them profitable once more. Congress should resolutely decline to do anything of the sort. Water won't run up hill, and the old-fashioned canal will not compete successfully with the modern railway. The impossible has been performed. It is better to let the canals succumb to the fate of all outdated and unprosperous enterprises at once than to spend no end of money on them only to learn at last that they belong to a past era, as they undoubtedly do.

In the Canyon of the Rio Grande.

Readers who lately passed over the "Sunset Route" may recognize in the engravings on this page scenes which delighted them in ronts. It may be that the water fowl and the grand old huck did not appear; such features of a landscape do not generally materialize when most wanted, and the reader must take the artist's testimony as to their existence. There is enough, however, in the engraving to show that the scenery in the canyon of the Rio Grande is worth a journey to sea. The mouth of this canyon is in Texas, about 750 miles westward from New Orleans. Major Ben. Truman, in his book, entitled "From the Crescent City to the Golden Gate," speaks very highly of the beauty of the river, which is the geographical boundary between the United States and Mexico. At one point he speaks of the canyon being bounded with vertical limestone walls on each side, from 250 to 300 feet in height, and the tourist is treated to a scenic and engineering paradox of traveling a long distance up the river on a down grade. Two miles further west, the train enters a tunnel 1426 feet in length and 75 feet above the water line, emerging from which it moves along for several miles upon a wonderful piece of shelving out of the great limestone bluff overhanging the river and about 60 feet above it. This is pronounced by Major Truman one of the grandest pieces of railroad travel in the world, and is very beautiful and very impressive for quite a distance. The engravings give some idea of the startling and beautiful features of the railway construction and the scenery.

Academy of Sciences.

Dr. Harkness presided at the meeting of the California Academy of Sciences on Monday evening. George J. Ainsworth was proposed for resident membership. Edward L. Greene read a very interesting paper on "The Flora of Santa Barbara Channel Islands."

Dr. George Hewston read a paper "On Sponges," which was illustrated by the aid of the stereopticon.

F. L. Clark, who accompanied the party of Queen Kapiolani to this city, and who has resided for 20 years in the Hawaiian islands, illustrated by means of a stereopticon a number of views of the ancient Hawaiian temples and idols that existed and were worshiped at the time of Captain Cook. These series of photographs have been presented by King Kalakana to the Academy of Sciences. Fac-similes of these photographs will be sent to the leading scientific societies of the country. There are over 200 photographs in the collection, and they are of great historical value.

The president read a brief statement to the effect that Miss Haggin and Mrs. Hanson had made a collection of fresh-water algae in Lake Tahoe. These specimens had been sent to Francis Wille, of Pennsylvania, an authority in such matters, and he has reported them to be splendid specimens. He said he had been trying for 10 years to get samples of California fresh-water algae, and was extremely gratified to have at last succeeded.

THE Calumet and Hecla Copper Co., of Lake Superior, is said to have made contracts with all large consumers in the country for six months' supply. This will involve 25,000,000 to 30,000,000 pounds. The price was 10 cents per pound, making the value of the transaction from \$2,500,000 to \$3,000,000.

A SAN FRANCISCO COMPANY, known as the Junction Company, is to carry on operations on the Gold Belt, near Hailey, Idaho.

selves superseded. The record of the decay of Pennsylvania's system of State canals, which had entailed a debt upon the commonwealth of upward of \$40,000,000, has already passed into the realm of ancient history. The State of New York has been compelled to make the Erie canal, with all its wonderful natural advantages, toll free in order to save it from abandonment. Scores of less important private and State canals have dried up and been forgotten by the present generation.

The latest important canal to become a candidate for inevitable bankruptcy is the Chesapeake & Ohio, of Maryland, which extends from Georgetown to Cumberland, following the north bank of the Potomac river for a distance of 184 miles, and tapping at its western end the famous Cumberland coalfields of Western Maryland.

This canal has a most interesting history. Its projector was Washington, who, long before De Witt Clinton had made himself immortal by projecting the Erie canal, had conceived the idea of connecting the waters of Chesapeake bay with the Ohio river by means of a canal. During his lifetime a company was formed for this purpose, of which he was president. But Washington died before any real work was entered upon in this direction. It was not until 1828, during the last year of John Quincy Adams' administration, that

EDITORIALS.—Immigration and the Mines; The Keystone Boiler; Mining Bureau Field Work, 313. **Pastings Events;** Why Mines are For Sale; Alaska and Its Mines; Local Industrial Exhibition; The Colliery Disaster at Nanaimo, 316. **Tests of Materials;** The New Navy and Coast and Defences of the Future, 317. **ILLUSTRATIONS.**—Sectional Views of the Keystone Portable Boiler, 313. **Scenes in the Grand Canyon of the Rio Grande,** 315. **Tests of Materials,** 317. **MECHANICAL PROGRESS.**—English Comments on American Tools; New Process for the Protection of Tools; New Process for the Protection of Iron; The Effect of the Metal; Influence of Temperature on the Strength of Iron and Steel; Steel Ingots by Improved Method; A New Metal Industry; Hardening and Tempering; New Process for Making Steel Pipes; New Process of Annealing Wire; A New Form of Tin; A New Imitation of Gold; To Soften Lead; Tempering Brass Springs, 318. **SCIENTIFIC PROGRESS.**—The New Electrical Force; Fixation of the Gaseous Nitrogen by Arable Soils; Electrical Stoves; The Comparative Effects of Heat and of Solar Light; Fossil Charcoal; Scientific Exploration; Effect of the Electric Light upon Plants; Underground Electric Wires; Natural Curiosities, 318. **USEFUL INFORMATION.**—India-Rubber Horse-shoes; A New Danger from the Bottle; A New Way of Keeping Store Accounts; Artificial Wheatstones; Simple Measurement; Olive Oil for Lubricating Purposes; Utilizing the Sparrow; Bruises on Wood; To Detect Sewer Gas; How to Telephone Easily; Electricity for Capital Punishment; Straw Burning Stoves; To Convert Centigrade Degrees into Fahrenheit, 319. **GOOD HEALTH.**—Stomach Digestion; Care of the Hands; Is the Bark of the Locust Tree Poisonous; Where to Dig the Well; A Moderate Use of Tobacco; To Develop the Lungs; Mind and Health; Responsibility of Landlords; Sweet Oil to Prevent Sores; Bread Fresh and Stale, 319. **MISCELLANEOUS.**—Gold in California; The Mining Outlook for Calico District, 314. **Carpenters Here and Abroad;** The Decay of Canals; In the Canyon of the Rio Grande; Academy of Sciences, 315. **Mining and Grazing Interests Compared;** Notices of Recent Patents, 319. **MINING SUMMARY.**—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 320-1. **MINING STOCK MARKET.**—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 324.

Passing Events.

The dreadful disaster in the coal mines at Nanaimo is the worst that has ever been experienced on this coast. We have been particularly free from mining disasters of magnitude, and especially in the coal regions. The loss of life was very great, as the account in another column shows.

All over the State improvements of every kind are in progress. Not very long ago civil engineers were very short of work, but now their services are in demand and all in the profession are busy.

There is just now a sort of "hoom" in sewers. Most of the larger cities are following the example of San Diego and giving careful attention to the sewerage systems. Those which have none now are planning them, and those which have old ones are improving and altering in accordance with modern ideas of sanitation. Much of this is due to the presence on this coast of Col. Waring, the distinguished sanitary engineer.

The Mining Bureau has this week started assistants into the field for the purpose of obtaining practical information which will be of benefit to the mining community when published.

ADVICES from Boston say that the new explosive, melinite, is useless for war purposes, as it decomposes if kept long.

Why Mines Are For Sale.

Why mere mining claims or locations on which little or no work has been done should be offered for sale is no mystery; but why the owners of mines that have been opened, equipped with plant and brought into a profitably productive condition should be seeking buyers for these properties is, to the uninitiated, matter for wonderment. And yet even this is easy of explanation. It often happens that the owners of these outfitted and producing mines own also undeveloped claims in the neighborhood, sometimes a number of them. In the value of these claims they have such confidence that they would be willing to spend money in opening and testing them if they had or could procure it for that purpose. These claims, so long as they remain unprospected, are valueless, as they cannot in that condition be sold, and, instead of yielding any income, are a constant tax on the owner, who, unless they are patented, is obliged to expend at least \$100 upon each one of them annually. With the proceeds arising from the sale of one producing mine, it would be possible to open up two or three of these claims and perhaps develop in each of them large values. Hence the desire so often manifested by this class of proprietors to sell what the English call a "going" mine.

Again, it may happen that a man, having spent a great many years building up a profitable mining property, is anxious to get out of the mountains and take up his residence where he can for the remnant of his days enjoy more of the comforts and luxuries of life, to which end he may be willing to dispose of such property at a sacrifice. There are cases, too, in which impaired health or severe hurts received, incapacitating men for labor or further usefulness in the mines, may predispose them to sell a profitably producing mine at a bargain.

As regards the great masses of miners, more especially the class known as prospectors, they make it a part of their business, and in many cases their sole business is to take up and hold mines, or rather mining claims, for the purpose of selling them. On these claims they are apt to do no more work than is required to hold them, though they are to be found in all stages of development. Not only so, but they possess every degree of merit. Some of the veins are large and some small, some rich and some poor. As these deposits vary in promise, so do they vary in the prices asked for them, these prices being largely dominated by circumstances, often by the mere whims of the owner.

The men who discover mines are for the most part practical miners or professional prospectors. Their capital consists of their labor, enterprise, and capacity to endure exposure, hardship and fatigue. Going out into unexplored regions, they find mineral deposits which they take up and hold, doing thereon only enough work to keep good their possessory title to them. This as a rule is all they are able to do, and is all that the most of them ever propose to do, their object in locating these claims being, as before remarked, to sell, in fact, the means to do this.

When rich or even tolerably good ore is found at the start, the miner may be able to not only thoroughly prospect his claim, but bring it into a state of active production. But such occurrence of ore rarely happens. Generally much costly deadwork has to be done before any considerable body of pay ore is reached. If the mine is to be exploited by adit, this from the commencement is an expensive business. If by shaft or incline, this too becomes expensive as depth is reached. When pay ore in quantity is developed, then a mill or other style of reduction works must be put up; all of which involves an expenditure far beyond the common miner's means. There is left him, therefore, no alternative but to sell his claim for the most he can get for it. Hence the many properties of this kind seeking purchasers, some of these properties possessing values that ought to recommend them to investors.

The qualifications that make a successful prospector do not always make a good business man or even a good practical miner. A first-class prospector requires to be constitutionally sanguine and hopeful. If trusting and venturesome and even disposed to be a little visionary, this does not detract from his fitness for such

calling, however much these peculiarities might disqualify him for carrying on a business in which careful calculation, cool judgment, system and attention are essential to success. A consciousness of his deficiencies in this respect has, no doubt, much to do in determining the prospector to sell rather than work his mines. In adopting this plan he does not conform to that subdivision of labor which in every branch of business has been found economical. The farmer finds it to his advantage to sell his wheat to the miller instead of converting it into flour himself. The grape-grower disposes of his vintage to the wine-maker, the cattle-raiser sells his hides to the tanner, and so of numerous other industries in which the producer of the raw material makes a gain by transferring it to other hands to be converted into marketable shape. The virgin mine is the raw material of the claim-locator and the prospector, which being unable to work themselves they desire to sell to the capitalist and the skilled miner.

Local Industrial Exhibition.

In view of the fact that many strangers and visitors are now thronging to California it is the intention to have the next exhibition of the Mechanics' Institute in this city of a more thorough character than has been the case. A meeting of representative citizens was held at the Institute on Tuesday last to consider the best means for receiving a suitable and proper representation of the products and resources of the State. It has been acknowledged that former exhibitions were more or less local, but this time they desire exhibits from all over the State. A large number of prominent citizens attended the meeting and the subject was thoroughly discussed.

A. P. Williams offered the following preamble and resolution, which were unanimously adopted:

WHEREAS, A large immigration of desirable people is now pouring into the Pacific States and Territories, and unusual attention is being given to California, her productions, capabilities and advantages as a place of residence; and,

Whereas, The citizens of San Francisco, the natural center of trade and commerce on this coast, should unite in an effort to secure a fair share of attention to this coast and State, and no better way of advertising the advantages of our State and displaying her resources and capabilities, and, at the same time, an example of the commercial supremacy of our city, can be suggested than to hold, during the coming autumn, a comprehensive exhibition of the products of our city, State and coast; and,

Whereas, The Mechanics' Institute has made arrangements to hold an industrial exhibition in this city during the months of September and October next, and proposes to divide \$30,000 to \$35,000 for the expenses thereof and for extra attractions and decorations, and as it is of interest to all our citizens, property-owners and merchants, that an effort should be made to hold in this city a more comprehensive exhibition than has yet been attempted by the Mechanics' Institute; therefore be it

Resolved, That the Chair appoint a committee of 12 representative citizens, who shall take measures to make the coming exhibition more attractive and comprehensive than any heretofore held on this coast, and that the said committee have full power to do all things necessary to that end, including the fixing of premiums, and collecting and disbursing of money for that and other purposes.

Chairman W. T. Garratt announced the following names, selected to serve on the committee: Wm. T. Coleman, F. W. Sharon, A. S. Hallidie, Adolph Sutro, A. P. Hotaling, J. B. Stetson, J. M. McDonald, J. Mervyn Donahue, N. Van Bergen, A. J. Bryant and B. P. Flint.

The Colliery Disaster at Nanaimo.

The most disastrous mining accident that ever occurred on this coast was that of the explosion in the coal mine at Nanaimo, B. C., by which upward of 150 miners lost their lives. The real cause of the explosion is not known, some attributing it to fire-damp and others to fine coal dust. The lost miners were natives of England, Scotland, Ireland, Nova Scotia, and a few were Americans and Chinese. Most of the bodies have been recovered, and though many were killed by the explosion itself, most of them died from the effects of the after-damp, as is shown by the condition of the bodies. Some of the men wrote on the timbers in the mine, showing they were alive many hours after the explosion occurred.

A fire broke out in the air shaft after the explosion, and considerable valuable machinery was destroyed. Rescuing parties entered the workings as soon as possible, but it was impossible to save any of the men in the mine. Great distress prevails among the families of the dead miners, and subscriptions are being raised for their relief. This city has eul-

scribed a goodly sum, two principal mining men, Messrs. Mackay and Flood, heading the list with \$1000 each. The other mines closed down in the vicinity, and the men formed rescuing parties. Business at Nanaimo has been completely stopped for a week.

Alaska and Its Mines.

When Alaska was first purchased it was supposed we had made a very bad bargain, but we have since found it to have been a good one. The seal and salmon fisheries alone are worth more than we gave for the whole region. The timber resources are immense and will be utilized in time. The gold mines are only beginning to be found, but those which have been developed are yielding well. One mine alone, on Douglas island, is sending down \$75,000 to \$80,000 per month in gold bullion.

There is now some talk of making Alaska a penal settlement for the United States. It seems odd to even suggest the largest Territory we have for such a purpose. Yet many people here are rather pleased at the idea and speak well of it. If the United States should ever adopt the policy of penal settlements, which is very doubtful, it would take as many men as there were prisoners to keep the latter there. With an extensive seacoast and a practically unexplored interior territory abounding in rivers, there would be so many opportunities for escape that the experiment would be doubtful. The sea-coast climate is milder than many places on the Eastern coast in winter, and while the interior is very cold at that season, in summer it is extremely hot. Those who have resided there do not speak unfavorably of the country other than it is isolated and thinly inhabited.

It is probable, however, that in the next few years more mines will be found in that region, and it will be so much settled up that any idea of a penal colony will be abandoned, even if it is seriously entertained now. Any country that can show one such mine as the Treadwell is apt to show others equally valuable. The ore there is not high-grade, but there is an abundance of it. The mine is equipped with one of the best gold quartz-mills in the United States. It has both water and steam-power. The other day \$80,000 in gold came down for the April product. Another enterprise, the Union Company, of Boston, is proceeding with the erection of its machinery on Douglas island. The water supply is abundant. Steam is shut down for the season. Four roasters are running night and day, treating sulphurets.

The owners of the Berner Bay property sold three mines last week for \$30,000. Good ledges are reported located in the Silver Bow basin.

Then the Yukon and Stewart river placers are still to be heard from. Wonderful stories came from the Yukon last fall, and several hundred miners have gone from California, Oregon and British Columbia to that region, as well as several hundred more from the Juneau (Alaska) region. Altogether, for a new and unprospected country, the mining prospects of Alaska are bright. A few good placer camps on the Yukon would alone bring several thousand experienced miners into the Territory, notwithstanding the short mining season due to the long winters.

THE EARTHQUAKES.—Very severe earthquakes occurred last week in Arizona, New Mexico and Northern Mexico. It was at first reported that volcanoes had broken forth, but these reports lack confirmation. No very great damage has been done. There are the usual cracks in the earth, new springs, etc., accompanying severe disturbances of the kind. The United States Geological Survey has taken immediate action for the purpose of the collection of valuable information regarding the recent earthquakes in Arizona. The plan is to send letters of inquiry, with pointed questions, relative to the exact time the shocks were felt, their duration and any other particulars which give an idea of the intensity of the shock, the apparent direction in which the wave traveled, the accompanying sounds, the effect on springs and wells and the contour of mountain ranges, etc. Great reliance has been placed upon voluntary assistance, correspondents, newspapers, etc., in the disturbed area. Such assistance resulted, in the case of the Charleston earthquake, in the accumulation of an immense amount of valuable data.

The New Navy and Coast Defenses of the Future.

On Thursday of last week the first annual banquet of the Chamber of Commerce of San Francisco took place, and there was a large gathering of representative citizens. Wm. L. Merry, president of the Chamber of Commerce, presided. Speeches were made in response to toasts by General O. O. Howard, Mayor Pond, W. W. Morrow, C. N. Felton, Horace Davis and Irving M. Scott. Mr. Scott spoke to the toast of "The New Navy and Coast Defenses of the Future," and his remarks were of great general and local interest, we give them in full as follows:

Mr. President and Gentlemen of the Chamber of Commerce: In attempting to respond to this toast, permit me to say, if the Chamber of Commerce were the Chamber of Congress, the wants of the Pacific Coast would be fully supplied, and her interests protected in every respect.

Therefore, let it be the duty of this Chamber to weld into a solid phalanx all the interests on this side of the continent, and marshal them to reap the harvest which modern progress is preparing for the brave of heart and vigorous Saxon of our day.

Great Britain and Ireland have 120,832 square miles of area, and a population of 35,241,482. California has 168,000 square miles of area, and at the last census, the United States has 55,000,000 of people. Now move this entire population within the border lines of California and you will have less people to the square mile than now live in England. By the courage and faith of her sons, England's power has circumnavigated the globe, and her flag greets the sun on his daily journey in every clime.

With more and varied land, with the sons of pioneers, it is possible for this coast to support a population which will discount any colony that England has yet planted. The Pacific ocean has 67,800,000 square miles of area. It drains 8,600,000 square miles. America has a coast line of 1200 miles on the Pacific, and 3000 miles on the Atlantic, and 2200 miles on the lakes; 5,201,175 of people dwell on these waterways, whose cities cost \$4,037,281,000, and whose annual manufactured product amounts to \$1,109,243,466. This is the field the navy of the future must protect. The commerce of this field is the enticing prize which awaits our merchants and which they must rescue from the hands of others. Can it be done? Let us compare the relative cost of water and land carriage.

The Burgos left China with a cargo of 5,600,000 pounds from Plymouth to Alexandria, a distance of 3380 miles. The consumption of coal was 282,540 pounds, or 83.5 pounds per mile, or $\frac{1}{3}$ ounce of coal per ton of freight per mile. Speed 10 miles per hour. The Aherdeen, a sister ship of 5000 tons, makes 10 miles per hour with a consumption of 18 tons of coal per day or $\frac{3}{4}$ ton per hour, or 9-16 of an ounce of coal per ton per mile. Both engines are of triple expansion type, carrying 160 pounds of steam. The Burgos could bring 2800 tons of freight to this port from New York in 60 days, on less than 600 tons of coal. She could coal at Rio on the Atlantic and at the coal mines of Lota on the Pacific, thus reducing her non-paying cargo to a minimum.

The best authentic record of any locomotive is two ounces of coal per ton of freight per mile at a speed of 13 miles per hour, including stoppages, and where the grades are from 55' to 70' per mile, the consumption of coal is five ounces of coal per ton of freight per mile. This then is the competition which has been so skillfully managed that it has absorbed our ocean trade. Merchants of San Francisco, with the expenditure of less capital, with less energy than the artificial ways of trade have required to construct, all this commerce can be yours; reach out for and secure it, turn its volume through this city, our city, and enrich every calling in it.

The war of 1812 found the most efficient weapon to be a 42-pounder, 10 feet long, weight 4 tons, using 10 pounds of powder, to a charge of shot weighing 42 pounds, and a muzzle energy of 300-foot tons.

In the war of 1862, the Rodman gun was 16 feet long, weight 20 tons, charge 130 pounds of powder, shot weighing 450 pounds, and a muzzle energy of 9000-foot tons.

The gun which confronts us to-day is 45' 6" long, weight 115 tons, charge of powder 850 pounds, shot 2300 pounds, with a muzzle energy of 55,000-foot tons. This gun, at a distance of one-half a mile, will penetrate 30 inches of iron, 24 feet of concrete masonry, or 75 feet of earth. This gun, rendered useless in the defense of nations, every fort built of masonry, brick or concrete, and left all coast defenses, except sandhogs and earth, as if they had never been built, and the pneumatic gun of Lieutenant Zolinski, with a range of two miles, its shell carrying dynamite, has changed the efficiency of those massive works of naval skill and science. The armored ships of war in Italy's navy, the Italia of 13,000 tons of displacement, with 18,000-horse power, armed with 4 guns, of 103 tons each, and protected with 19" of armor, would disappear as a bubble does when it bursts, should a shell carrying 400 pounds of dynamite fall upon its deck.

The forts of the future will be small holes in the earth, comparatively inexpensive, as compared with previous works of defense, protect-

ed, perhaps, with Gruson's cupolas of cast iron, fitted with disappearing cannon, which descend to load and ascend to fire, all embarked with sandhogs or earth. These guns will be operated entirely by mechanism, moved with compressed air. The navy of the future will be swift of motion, of great endurance, heavily armored and manned by the flower of American youth.

Our Christian warrior, in his plea to-night, asks, in the interests of peace and good government, for a substantial increase in the army. With such advice before us from so distinguished a source, it will justify a layman in asking for an increase for the navy—aye, a hundred-fold. Our new navy is now confronted with 2748 battle ships, employing 282,375 men, and costing \$181,422,875, and supplied with every appliance known to modern science. The navy of the future should be manned by the young, full of hope and courage. These men should be so equipped by knowledge taught in our schools as a necessary part of a liberal edu-

tempted a revolution at home. Then let it be the duty of this Chamber of Commerce to see that our nation so legislates in the future that the principles of nautical astronomy and practical navigation and use of cannon shall be taught in every State university, and that all institutions of learning now built and now being founded shall add to their curriculum this long-neglected art, and stir the hearts of coming Paul Jones, Decatur, Perry and Farraguts to emulate and excel historic records, and make the navy of the future the glory and pride of our nation as "we spin forever down the ringing groove of change" with the starry "banner full high advanced."

Tests of Materials.

The Department of Mechanical Engineering in the University of California has of late been doing some good work in testing materials such as iron, stone, cement, brick, etc., and is pub-

1. All specimens for testing must be in duplicate.

2. Every specimen must be prepared by the sender so as to conform exactly to the corresponding diagram to be selected from the annexed ten, having proper regard to the material to be tested and to the kind of test required.

3. A full and complete description must accompany each and every specimen. If metal, the character and place of manufacture; if stone, the locality where found must be stated, etc.; and in general the description must be full enough to make the test executed of public, and not merely of private, value.

4. The freight or expressage on all specimens must be prepaid.

5. All communications must contain the name and address of the sender, otherwise the application will receive no attention. All letters should be addressed and specimens marked, Department of Mechanical Engineering, University of California, Berkeley, Alameda Co., Cal.

All specimens will be retained by the Department for future reference. The results of the desired test will be forwarded to the party making the application, and may be published in the bulletins of the Department.

In order that those desiring to have materials tested may send their specimens properly, we take the cuts and instructions from the circular just issued by F. G. Hesse, Professor of Mechanical Engineering at the University.

In the accompanying cut, showing form of specimen for breaking or ultimate strength of metals, d =diameter of reduced section; d' = $d + \frac{1}{8}$.

The greatest admissible diameter for round specimens, beyond which they cannot be tested, must be taken from the table below:

TABLE FOR GREATEST ADMISSIBLE DIAMETERS AND AREAS.

NAME OF METAL.	Tensile Strain, Elongation, etc.		Crushing Strain.
	Greatest Diameter, Inches.	Greatest Area, Sq. Inches.	
Cast iron.....	1.0062
Wrought iron.....	.87	0.60	1.00
Soft steel.....	.71	0.40
Hardened steel.....	.65	0.53
Cast steel.....	.63	0.27
Cast steel, tempered.....	.63	0.22
Copper.....	1.00	1.20	.95
Yellow Brass.....	1.00	2.40	2.00
Gun Metal.....	1.00	.77
Phosphor Bronze.....	.90	.70
Cast zinc.....	1.00	5.00	2.00
Lead.....	1.00	2.00
Tin.....	1.00

For rectangular specimens the greatest admissible width, (see cut) $w=1\ 15-16"$. The area of rectangular reduced section must be taken from the table.

In the form of specimen for breaking strain, elongation and limit of elasticity in metals, the greatest diameter of metal to be tested depends on its character, and must be taken from the table.

The maximum width (w) of the flat specimens which can be tested with the apparatus is $1\ 15-16"$. For sec. a , refer to table. Three specimens are required for a thorough test of the above strains.

Wire of any diameter or gauge, irrespective of metal, can be tested; but triplicate specimens are requisite. (See cut for size.)

In the specimen to find breaking strain of hemp or manilla rope, the outside measurement, a , should not exceed two inches. Every specimen of rope must be so prepared by the sender as to correspond to above diagram. The loops on the ends should be well applied.

As to breaking strain and elongation of chains, the outside measurement of links must not exceed $1\ 15-16$ inches, in order that the chain may pass freely through a hole 2 inches square. Every specimen of chain must be accompanied by a rod 30 inches long, representing the material from which the links are forged and made. No chains, whether forged or made from flat iron and riveted, must be too large to pass freely through a two-inch hole.

As to the breaking strain, limit of elasticity and elongation of wire rope, no tests will be made of wire ropes having a greater circumference than three inches, and no steel ropes having a circumference greater than $2\frac{1}{2}$ inches will be tested. Three specimens are requisite for a thorough and complete test.

Length of each specimen for compressive strain of metals to be twice the diameter. The largest diameter possible for the specimen to be tested depends on its character, and must be taken from the table.

For specimens of hard stones, as granite, quartz, onyx, etc., the side, s , of the cube should not exceed $1\frac{1}{2}$ inches. For softer materials, as marble, limestone, slate, etc., bricks, cements, artificial stones, etc., the side, s , of cube ought not to be more than $2\frac{1}{2}$ inches.

cation, that at our country's call, up from the counter, out of the workshop and from the desk, should respond an invincible volunteer corps, already trained in nautical astronomy, practical navigation and the handling of cannon.

The Congress of the United States in granting land scrip to universities, requires military training as a recompense for the gift, and every State provides for a militia to form a nucleus in time of war, and the National Guard is a reserve from which the nation can recruit its army; but nowhere, except a few private schools in the principal seaport towns, are there any provisions for the education of the simplest elements of navigation or the handling of cannon.

Why is this? History records many incidents where the army, in spite of all the care fostered upon it, has revolted, overturned the government and created a new one. But, Mr. President, if I recollect aright, no instance is on record where the navy has proved false to the flag of its country, or ever created or at-

lishing the information gained by the tests. This department intends to make itself as useful to the mechanic and engineer as the agricultural department has been made to the farmer, and will issue bulletins as often as occasion demands.

They are now prepared to test materials for tensile and compressive strains, elongation and limits of elasticity. All tests which will yield results of practical value to the public at large will be made gratuitously, and the right is reserved to publish or exhibit the results. Tests will not be made when, in the opinion of the professor in charge, the object does not appear of sufficient importance to warrant the expenditure of time and labor. Persons sending or forwarding materials and specimens to be tested must observe the following rules:

MECHANICAL PROGRESS.

English Comments on American Tools.

London *Iron* says: "Our American contemporaries have every cause to be surprised at the astonishing fact that thousands of tons of scrap-iron are every year taken to the United States, and there converted into the simplest of American manufactures—the ead or landry-iron—and then exported back to Europe at no small profit. There is not one corner of Europe where American small cast hardware is not on sale. The toolmakers and machinists of Europe—such as Krupp, of Germany, Whitworth and Armstrong, of England, and Hotchkiss, of France, with their vast resources—are unable to produce a Monkey or screw-wrench equal to the American wrenches, and consequently they have to import these tools from the States. It is stated that there are no less than 80,000 dozen of them exported to Europe alone, every year. It is interesting to note that Charles Moncky, the inventor of this screw-wrench, received only \$2000 for his patent, and is now living at Williamsburg, Brooklyn, in a small cottage bought from the proceeds of this sale. In the matter of the common pocket box-wood rules, also, the American manufacturers so far excel all others that, if not all European nations, certainly all nations outside of Europe, are supplied from America. The manufacturers there print on the rule whatever system of measurement is followed by the country for which the goods are intended. American augers and auger-bits are used the world over, no other nation being able to compete. The Americans, with such facts before them, may well be proud of their manufacturers."

New Process for the Protection of Iron.

The problem of preserving iron from oxidation may fairly be termed one of the great issues of the present day. Hitherto it has been effected in widely opposite ways. One method has consisted in converting its surface into an oxide, another in applying paint or enamel, another in coating it with zinc. All these methods bear the aspect of being expedients merely, and do not present a definite solution of the problem.

Of all the ordinary metals, lead, which resists some of the stronger acids, such as sulphuric or hydrofluoric, may be regarded as the most durable. A new process for coating iron with an adherent layer of this metal has recently been discovered and perfected by Mr. F. J. Clamer, of the Ajax Metal Co., of Philadelphia. By it the iron is covered with a uniform coating of silvery lead. The roughnesses and indentations of the iron receive the lead, as well as the smooth parts. The result is a perfectly protected piece as long as the lead endures, and it is practically everlasting. No oxidation can affect the iron. It is especially adapted for the protection of sheet iron for car and boiler roofing, for spikes, bolts, nuts, pipes, hoiler tubes, water tanks, iron bridges, and wherever the protection of iron or steel, wrought or cast, is desired. Its cost is no greater than that of the ordinary zinc or galvanic process. The superior excellence of the new method, its comparative cheapness, and the wide range of its applications, mark it as one of the most important of recent improvements in the useful arts.

THE EFFECT OF HEAT ON METAL.—Everybody, observes one of our contemporaries, who has used the Brooklyn bridge, must have noticed the overlapping slides at the middle of each span, that allow the structure to grow short or long, as the weather grows cold or hot, and the marks thereon that indicate a distance of several feet between the extremes of contraction and expansion. Yet few suspect that the bridge contracts or expands sideways from the heat of the sun, though the degree is so small as to be almost imperceptible, and not nearly so great as if the bridge ran north and south. The same phenomenon has been noticed of late in structures of stone and iron. The Washington monument leans to the east in the morning and to the west in the afternoon. A plummet line suspended in the interior of the dome of the capitol at Washington was found by actual measurement to swing over a space of $\frac{1}{4}$ inches, making a total dip from the perpendicular of $\frac{3}{8}$ inches. This movement involves the entire dome. A learned monk, some years ago, suspended a plummet in this way from the top of the dome of St. Peter's, at Rome, and was astonished to find this mysterious movement. He attributed it to a third and undiscovered motion of the earth, but it was afterward explained as the effect of the action of the sun on the metal of the dome.

INFLUENCE OF TEMPERATURE ON THE STRENGTH OF IRON AND STEEL.—B. Papkoff gives in the *Russian Mining Journal*, an account of an extensive series of experiments on the influence of cold on the strength of iron and steel in various forms and under various kinds of strain, but circumstances obliged him to abandon his intentions after a few tests had been made. He thinks, however, that the results he was able to attain are worth being made known, because they seem to point to conclusions totally opposed to those generally received. All the specimens tested were taken from soft steel and iron plates, three samples

being cut from each plate. One sample of each group was tested at the ordinary and two at the low temperature. It was found that both the ultimate strength and percentage of elongation increased very sensibly with the decrease of temperature; the author remarks that such a result was to be expected, because the contraction caused by cooling has the effect of bringing the particles of matter closer together and consequently of intensifying the force of cohesion; but he also observes that a law which may be found general for strains gradually imposed may not apply at all when they assume the nature of shock or of impact.

STEEL INGOTS BY AN IMPROVED METHOD.—A company has been formed for the purpose of establishing a new steel works at Manchester, England. The company has the option of purchasing the right to a patent belonging to Mr. Thos. Hampton and Mr. John Facer for the manufacture of special steel ingots by an improved method, which consists in casting parallel ingots in groups in divided molds, in sizes varying from three inches square and upward, similar to the molds used in casting crucible steel ingots, and by which method it is stated the ordinary process of cogging and hilling is avoided. Mr. Thos. Hampton is to act as managing director and general manager of the proposed new company for a period of five years.

A NEW METAL INDUSTRY.—Kuhlow's says that in Germany gold, platinum and silver strips are welded, after the mosaic style, upon a metal ground, prepared by the incandescent process, then compressed by means of powerful presses, and finally elongated by rolling into long sheets or strips. These sheets, which are now of all colors—yellow, red, green, white, gray and black—are made into scarfs and neckties, which, being indestructible, are considered of some practical worth. This novelty, it appears, has found great acceptance abroad, numerous orders for export having been received by the manufacturers, who are chiefly in the Pforzheim and Baden districts.

HARDENING AND TEMPERING.—When a piece of metal requires hardening and tempering at one part only, heat the steel behind the part to be tempered to redness, and dip the article so as to harden the required part, and leave sufficient heat in the contiguous metal to raise the temperature of the hardened part enough to temper it. This plan is usually followed in the tempering of lathe and planer tools, flat drills, etc. If, however, the method of dipping is to hold the steel in the water at an even depth after the immersion, the temper color will be very narrow, while if the steel be raised and lowered in the water, the color-band will be broad.—*Builders' Reporter*.

NEW PROCESS FOR MAKING STEEL PIPES.—The new method of making steel pipe at Barbach, Germany, is said to be very successful, and the process of manufacture is briefly as follows: As soon as the steel is cast into the round mold a core is thrust into the steel, so that the tube is formed between it and the sides of the mold. In order to prevent cracking of this annular casting during cooling, the core is made up in such a manner that it follows up the shrinkage of the steel. The steel cups thus obtained may then be rolled in an ordinary train. It is stated that a large firm in Paris proposes to apply the method to the manufacture of copper tubing.

NEW PROCESS OF ANNEALING WIRE.—A new process of annealing wire consists in coiling the wire upon a hollow metallic core or drum, embedding the wire and core in sand or its equivalent, surrounding a central open space, subjecting the whole to heat with the wire thus embedded, and then allowing the whole to cool before removing the wire from the embedding material. While cooling, the vessel is dipped intermittently into cooling liquid. William H. Sawyer, of Providence, R. I., is the inventor.

A NEW FORM OF TIN. called by the inventor, Albert Assam, of Rahway, N. J., "assayme," is produced by special treatment of tin. It has all the good qualities of the latter, can be precees into any shape, or cast into statuary, or used for plateware of any description. A beautiful bronze color can be given to the latter, or any shade from bronze to a silver color; and as it does not in the least corrode, it is especially valuable as a silver solder. It melts at a temperature of 430°, or 18° less than tin.

A NEW IMITATION OF GOLD.—A treatment of copper, tin and aluminum in an electric furnace is said to have stood the tests of acids and other means by which counterfeits are detected. The only failing is in the weight of the metal thus produced. That there is a great revolution ahead in the novel and unexpected developments of aluminum, in combination with other metals, as well as in its own individual applications, there can be no question.

TO SOFTEN LEAD.—There is no better way for softening lead than by recasting. If it is pure, it should be soft. Otherwise use it for other purposes than those which require the pure metal.

TEMPERING BRASS SPRINGS.—There is no way to temper brass springs except by hammering. There is no chemical or heating process for tempering anything but steel.

SCIENTIFIC PROGRESS.

The New Electrical Force.

Not long ago Mr. Langdon Davies, of London, while investigating the induction noises caused in the telephone wires, came to the conclusion that the effects ascribed to induction afforded evidence of the existence of a form of electrical force which might be separated from currents, and which could pass freely through insulators impassable by currents. His conclusions were justified by experiments, but it was not until a short time ago that phonoporic telegraphy could be successfully employed, and that the principle could be utilized upon an existing telegraph line which was at the same time being worked by the ordinary instruments.

The phonoporic instruments have no conducting circuit through them, but this is nevertheless a fact. The phonopore gives uninterrupted passage to electrical effects capable of being associated with sound, although it does not permit the passage of electric currents. In exterior form the transmitter appears to be an ordinary Morse key mounted on a base about four inches high. This base contains an instrument which somewhat resembles an induction coil. The impulses are generated in a primary circuit of improved construction, over which is wound, in place of a secondary circuit, a phonopore of two wires insulated from each other throughout their entire length and at both ends, each of these wires being, however, connected at one end only to the line. The number of phonoporic impulses generated in the transmitter per second is regulated by vibrations of an organ reed placed in the primary circuit. Another reed tuned to the same rate of vibration is placed as a receiver at the distant station in front of an electro magnet, and the phonoporic impulses from the transmitter cause it to vibrate. A new form of contact breaker, operated by the receiver reed, completes a local relay circuit when the reed is still, but breaks it whenever the reed vibrates, thereby setting in action any required instrument in connection with any battery.

Careful, patient, and extensive experiment have more than realized all the expectations based on this discovery. There are many advantages which the duplexing of a telegraph service by adding a simplex phonopore possesses over the ordinary duplex system now in use. The cost of construction and of working is much less, and messages can be carried either in the same or opposite directions. Moreover, if the line is already working either the duplex or simplex on the ordinary system, the phonopore can still be added to it as if the wire were being used for nothing else. The phonopores are easily worked, and in the trials mentioned the instrument was worked at one station by a boy of 16, who had no experience with it.

The following description from *Nature* more fully describes one of these instruments: The instrument, while absolutely a non-conductor of continuous electric currents, still allows of the passage or transmission of rapidly alternating currents such as correspond to sound in vocal and harmonic telephony. The "phonopore" consists essentially of two insulated wires laid side by side, twisted together and wound upon a bobbin, one end of each wire being completely insulated. Regarded as a condenser, its capacity is very feeble indeed. Regarded as an induction coil neither the primary nor the secondary forms a closed circuit. Yet it transmits telephonic speech perfectly. It follows that Mr. Davies has solved the problem of telephoning on an open circuit. But the real object of the invention is to enable telephonic messages, including both vocal and harmonic under that name, to be transmitted through the ordinary telegraph wires without interference with or from the telegraphic messages that are simultaneously passing through the wires. Mr. Davies has devised a whole series of new telephonic apparatus in which not only the induction-coils of the transmitters but also the bobbins of the receivers are replaced by open-circuit phonopore coils. Apart from its purely technical value, the new instrument presents several points of great scientific interest, and opens up entirely new problems to the mathematical physicist.

FIXATION OF THE GASEOUS NITROGEN BY ARABLE SOILS.—According to the author's experiments, arable soil continually fixes free atmospheric nitrogen, even without any vegetation properly so called. This gain cannot be ascribed to atmospheric supplies or nitrogenous compounds, whether gaseous or dissolved in rain-water. In the experiments where the rain-water flowed away outside after having traversed the soil, the rain removed from the soil, in the shape of nitrates alone, more nitrogen than it had brought in the shape of ammonia and nitric acid taken together. Nevertheless the fixation of nitrogen was more considerable in earth exposed to the rain than in such as was under cover, doubtless by reason of the greater activity of the organisms which fix nitrogen by the circulation of air and water.—*M. Berthelot*.

ELECTRICAL STOVES.—Electrical heating stoves are being introduced in France, a peculiar feature of their construction being that the wires are let through apertures formed in plates of refractory clay and plumage. These plates are not inclosed, but are left exposed, so that

the air can circulate very freely through the apertures, where it comes in contact with the red-hot wires. Wire bobbins are inserted in the apertures, each bobbin forming part of the electric circuit, and all being connected for quantity; the bobbins are heated by the passage of the current, and serve to heat the air as it passes to and fro over them.

The Comparative Effects of Heat and of Solar Light.

All the actions of combustion which heat can produce may be also produced by light, but the converse does not hold good. There are many reactions which light alone seems able to set up. All these reactions may be summed up as a disturbance of the primitive molecule which is decomposed into simpler elements. These elements are few in number; they are, if we limit ourselves to volatile bodies, formic, acetic and butyric acids, methylic and ethylic alcohols, and ethylic aldehyde. These stable groups are generally found the same with one and the same body, whatever the source from which it derives its oxygen. But this is not always the case. Thus lactic acid, if burnt by means of atmospheric oxygen, yields acetic acid, but produces butyric acid if it obtains its oxygen from the salts of mercury. These stable residues of combustion do not pre-exist as groups in the original molecule, but result from a new arrangement of the molecules during combustion. This is proved by the fact that they are found identical in bodies of different types, and are not always the same with one and the same body. These products contain a smaller number of molecules of hydrogen and carbon than the bodies whence they are derived. The sole exceptions to this rule, the formation of formic acid at the expense of oxalic acid, and that of butyric acid from lactic acid, disappear if we double the formulae of oxalic and lactic acids. Potassium permanganate, which often acts in the cold and in darkness, does not yield other products than those resulting from the action of the sun and of heat. The bodies which it attacks are those which are found least stable under other oxidizing conditions. But if it does not occasion any novel facts, we may study with it very conveniently the circumstances of the experiment and the conditions of initial or final acidity or alkalinity which determine the result. These last conditions play a great part in the combustions made at the expense of oxygen, free or combined.—*E. Duclaux*.

FOSSIL CHARCOAL.—A correspondent of the *Scientific American* says: Perhaps charcoal has not often been observed as occurring naturally with mineral coal, though, as a result of metamorphism, graphite is not uncommon in coal districts. In a variety of hituminous coal that comes from Tennessee, there are to be seen along the cleavage planes films of true charcoal, in varying quantity, but commonly thin. This coal has been coming to us for several years, and all the while I have noticed in it the presence of the charcoal. I have scarcely ever put coal into the fire without making the observation; and there is perhaps not a lump, of size at all considerable, that does not contain these films. On close examination I have frequently found that the surface of the films on the broken lumps contains a delicate tracery, closely resembling vegetable impressions. The tracery is not so well marked as a fossil imprint, but not so indistinct as to escape notice.

SCIENTIFIC EXPLORATION.—An exploring expedition is being organized by the Dominion Government for the exploration and topographical survey of the western portion of the Canadas. The expedition will be conducted by Dr. Geo. M. Dawson and William Ogilvie and will extend its operations along the Stickeen river, along the Pacific Coast to the head of Chilcoot inlet, and survey the Yukon river as far as the 140th meridian. Assistant Secretary Maynard, of the U. S. Government, has instructed the custom officers of the Alaska district to allow the free entry of the members of the expedition and their effects, exercising only such supervision as may be necessary to protect the interests of revenue.

EFFECT OF THE ELECTRIC LIGHT UPON PLANTS.—A citizen of Davenport, Iowa, whose garden is situated at 100 feet from an electric light tower, has remarked that his lilies close at sunset, but open again a few minutes after the arc lamps have been lighted. It has been observed at Detroit, too, that the foliage of the trees exposed to the rays of the electric light is much more luxuriant than that of trees as are not.

UNDERGROUND ELECTRIC WIRES.—After a year's experience with underground electric wires, Philadelphia has found that it matters very little what sort of conduit is used. The public system there consists simply of a plank box containing lead-covered wires, filled in with pitch, and this fully answers every purpose.

NATURAL CURIOSITIES.—Coal miners frequently find curious formations in a vein of coal. An Annot (Pa.) miner took out a piece of sulphur a few days ago which was a perfectly formed ear of corn, the kernels and rows being very distinct. It was under 20 feet of solid rock and in the middle of the coal vein.

TELEPHONING between New York and Philadelphia is now as easy as it was between points about a block apart a few years ago.

Mining and Grazing Interests Compared.

Most sections of the great West, says the *Cour d'Alene Record*, have two leading industries, viz; stock-raising and mining. *Cour d'Alene* can boast of only one, and that the greater, as we shall endeavor to show. Which of these industries promotes the greatest good to the greatest number? Take a section of country devoted entirely to stock-raising, and about the only evidence of civilization we see is here and there a tent—the headquarters of a half dozen cowboys. The stockman selects his range and moves thence his herd. He is not desirous of neighbors, and should any encroach upon his domain he moves farther on. Once a year he drives his "surplus stock to an Eastern market, disposes of it and deposits his money in an Eastern bank. Little is the benefit derived from stock-raising except by the favored few who own the "cattle on a thousand hills.

On the other hand, consider the mining industry. A prospector discovers a mine. He develops it. Others, encouraged by his success, follow in his footsteps. The country is prospected, mines are developed and sold. There is a demand for the mechanic, the miner, laborer, artisan, and in fact, for followers of every branch of industry. Mercantile houses become a necessity. Towns and villages spring up as though by magic. Railroads extend their lines in that direction. Reduction works are built. The ranchman has a market for his produce, the teamster work for his team, and all classes prosper. On the one hand, a lazy herd grazing on the hills or in the valleys; on the other, the hum of industry and scores of happy and pleasant homes.

The days of immense profits in stock-raising are past. The ranges are overstocked, and the losses are great compared with what they were a few years ago. The ravages of disease among cattle, horses and sheep engross the attention of legislative assemblies. The hard winters and severe drouths cause alarm to stockowners, and already humanitarians are holding meetings in Eastern cities to devise ways and means to prevent people from keeping more stock than they can feed through the winter. All of these facts go to prove that this great industry must in a measure decline, and capital will seek other channels of profitable investment.

By keeping mining on a perfectly legitimate basis, by thoroughly developing such property and erecting the proper machinery for treating the ores, and by having men at the head thoroughly competent of managing such enterprises, there is no reason why this industry should not secure the aid of capital that would otherwise go to the stock business. By taking the same precautions as are considered necessary in all branches of trade, there is no reason why mining should not be made remarkably remunerative.

The mine-owner need not fear a rigorous winter; the drouth does not affect his interests, and pleuro-pneumonia and black-leg have no terrors for him. His product always finds a ready market, and, as applied to gold and silver, is the basis upon which rests the financial world. Wild-cat schemes and mining sharks should be discountenanced. The business should be purged of all things contrary to its advancement, and then the necessary capital will come to its aid without the hesitation heretofore experienced.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

JOINTER FOR ARTIFICIAL STONE WORK.—Geo. F. Gray, No. 361,692. Dated April 26 1887. The invention relates to the class of implements that are used in working with artificial stone in the laying of sidewalks, etc., and the invention consists in a jointer for rapidly and accurately making the joint between the independent blocks of artificial stone. The jointer is a handled tool having projecting from the plane of its face, and on the side thereof, a knife or cutter, the outer side of which is perfectly straight.

WATER-WHEEL BUCKET.—Henry Richards and W. J. Richards, Jr., Nevada City, No. 361,719. Dated April 26, 1887. The invention relates to that class of water-wheels in which a series of buckets on the rim or periphery of the wheel receive the impact of a stream of water issuing under head or pressure from a nozzle in close proximity, these wheels being generally known as "hurdy gurdys." The invention consists in the novel bucket, by means of which the construction of the wheel is simplified and the most effective reception, discharge and reaction of the stream is obtained.

A NICKEL (5 cents) COIN.—The Government 1½ cents. If the Government had the exclusive manufacture of these coins, there would be a great profit in them. But the coin can be so easily reproduced there is no means of estimating how many of them are counterfeit.

LAKE COUNTY has appointed men to solicit subscriptions for the \$75,000 bonds asked by the San Francisco and Clear Lake Railroad.

USEFUL INFORMATION.

INDIA-RUBBER HORSESHOES.—We have already made reference in these columns to the use of india-rubber as a material for horsehoes. We here append from an exchange some further facts and suggestions: To enable the horse to go easily over all kinds of roads and rough or slippery ground without slipping, Mr. W. Body, of Wittersham, proposes an india-rubber horsehoe, which, he says, obviates in one instance the necessity of using an iron shoe, and can be removed momentarily when the horse is not traveling; it can also be used when the horse is shod with an iron shoe. The shoe consists of an india-rubber bottom piece molded to fit over or round the frog and the hoof, with a ledge or projecting rim rising up the front and around about level where the nails are clamped, the projection having an edging, under which a steel band or other appliance can be drawn and nipped tight to retain the rubber shoe. The band is connected by studs, which pass through the heel part of the hoof, this being cut away from the inner side for the purpose. The stud or studs may work eccentrically to obtain the grip or fixing. The rubber shoe is preferably used without an iron shoe, particularly with young horses or horses with tender feet, but a light iron shoe may be affixed on it. If the india-rubber shoe is used with an iron shoe, the frog portion or pad has a front plate and two side wings partly imbedded in it, the projecting parts taking under the iron shoe to fix the rubber shoe in place. If the rubber frog be divided or made thin in the center, a swivel or other bar can be contracted from the rear to reduce the width of the pad so that it enters easily, and also expanded to fix the rubber shoe in position.

A NEW DANGER FROM THE BOTTLE.—Mr. G. W. Fitton writes to the *Chemist and Druggist* that he has narrowly escaped what might have been a serious affair. "Not having the blind down in front of the window as usual," he writes, "and the sun being very strong, the rays, after passing through a large carboy filled with the usual solution of bichromate of potash, were thrown on to the woodwork of the window inclosure, soon burning a piece nearly one-fourth of an inch thick and four inches long; more would have followed had I not discovered it in time. Should like to know," he adds, "if you have heard of a case like this occurring before?" There have been a number of similar incidents recorded, and it tends druggists in hand to be careful about displaying globular shaped jars in their windows where the sun's rays can be refracted by them.

A NEW WAY OF KEEPING STORE ACCOUNTS. The retail grocer at Burlington, Ia., is putting into practice a new scheme for keeping accounts with their customers. A small book of coupons, ranging in value from 1 to 50 cents, is furnished to the customer and is charged to him. When he orders goods he tears out coupons to the value of the order, in the presence of the grocer or his clerk, and destroys them. When a \$5 or a \$10 book of coupons is reduced to the cover, it is good evidence that goods to the value it represented have been purchased. It amounts to the same thing as paying spot cash for every order, but the customers have the privilege of paying for the coupon-book when it is used up. There are quite a good many advantages to be mentioned in favor of this system, and it will probably supersede in a great part the old style of book accounts.

ARTIFICIAL WHETSTONES.—The *Guide Scientifique* describes the following method of making artificial whetstones. Gelatine of good quality is dissolved in its own weight of water, the operation being conducted in a dark room. To the solution 1½ per cent of bichromate of potash is added, which has previously been dissolved in a little water. A quantity of very fine emery, equal to nine times the weight of the gelatine, is intimately mixed with the gelatine solution. Pulverized flint may be substituted for emery. The mass is molded into any desired shape, and is then consolidated by heavy pressure. It is dried by exposure to strong sunlight for several hours.

SIMPLE MEASUREMENT.—The approximate breadth of a river, or other stream, may be determined by means of the brim of a hat or the peak of a cap, and this can be done by a boy as well as a man. The person desiring to ascertain this fact must place himself at the edge of one bank of the river and lower the brim of his hat, or peak of his cap, till he finds the edge just cuts the other bank; then after placing the hand under the chin, he must turn round steadily till he faces some level ground on his own side of the river, and observe when the edge of the peak again meets the ground. The measure of this distance will be very nearly the breadth of the river.

OLIVE OIL FOR LUBRICATING PURPOSES.—Put pure olive oil into a clear glass bottle with strips of sheet lead, and expose it to the sun for two or three weeks, then pour off the clear oil, and the result is a lubricant which will neither gum nor corrode. It is used for watches and fine machinery of all kinds.

UTILIZING THE SPARROWS.—Here is the way they make sparrows useful in Germany: Long troughs, placed at the eaves of houses, are occupied by the sparrows in building their nests.

When the young are hatched and the mother goes out to procure food, wire screens are placed over them, with interstices large enough to permit the passage of food in to the younglings but too small to allow them to escape. As soon as they are large and plump they are killed, and make a very desirable article of food.

BRUISES ON WOOD.—Bruises may be taken out of the woodwork of scientific instruments by wetting with warm water. Then lay on the place brown paper about five layers thick, and apply a hot flat-iron until the moisture is evaporated. If the bruise is not gone repeat the process. If the bruise is small, merely soak it with warm water and apply a red hot poker near the surface. Keep the wood wet and in a few minutes the bruise will disappear.

TO DETECT SEWER GAS.—A very simple test to ascertain whether the air of any apartment contains sewer gas is made by saturating unglazed paper with a solution of one ounce of pure lead acetate in half a pint of rain-water; let it partially dry, then expose in the suspected air. The presence of sewer gas in any considerable quantity soon darkens or blackens the test paper.

HOW TO TELEPHONE EASILY.—It is said that an ingenious German has discovered that one may talk more easily through a telephone, and even converse in whispers, by making a funnel of thick manilla paper about 16 inches long and from 6 to 8 inches wide at the mouth, and placing the smaller end over the opening of the receiver.

ELECTRICITY FOR CAPITAL PUNISHMENT.—The Senate of Pennsylvania has passed a bill providing for the infliction of capital punishment by electricity. There are several patented devices in existence designed for such work.

STRAW-BURNING STOVES.—The Vulcan Iron Company, Winnipeg, Man., manufactured a large number of straw-burning stoves during the past season, the article going into consumption among the farmers in that section.

TO CONVERT CENTIGRADE DEGREES INTO FAHRENHEIT.—Double the number of Centigrade degrees, subtract one-tenth of the amount, and add 32 to the remainder. For temperatures below 0 Centigrade, subtract 32.

VINEGAR is better than ice for keeping fish. By putting a little vinegar on the fish it will keep perfectly well, even in very hot weather. Fish is often improved in flavor under this treatment.

THE OLDEST PICTURE in the world, or what is supposed to be such, is in the museum at Boulak, in Egypt. It is a fresco from a tomb at Maydoom, representing six geese.

GOOD HEALTH.

STOMACH DIGESTION.—Opportunities for studying gastric digestion through fistulous openings into the stomach are, thanks to modern surgery, more frequent than formerly. This is important, as the physiology of digestion, as understood at the present day, requires more than the classical instance of Alexis St. Martin to place it on a sound experimental basis. Such a case, with experiments *ad hoc*, is recorded in the *Revue Scientifique* by Von Herz, of Lausanne. The subject was a man, aged 28, on whom gastrotomy had been performed for occlusion of the oesophagus. The observations made were as follows: Bile always appears in the stomach during digestion, but generally only in the later stages. The amount of HCl amounts to 1.5 to 1.9 grammes per liter; it increases during digestion, and reaches its maximum in the third hour. Sodium chloride appears rather to diminish the amount of acid. When the stomach was empty in the morning but little pepsin was found, and a large amount of propepsin; pepsin accelerated digestion. In the first hour, of a quantity of albumen introduced, two per cent was digested without pepsin, 12 per cent with it. In the second hour, 23 per cent was digested without, 45 per cent with pepsin. In the third hour, 51 per cent without, 76 per cent with pepsin. These results agree with those obtained by Schiff. Chloral, quinine sulphate, and above all potassic iodide, retard digestion. The author would forbid red wine in disturbances of digestion, but would recommend bouillon and dextrin; blood fibrin is also indicated in many cases. —*Medical Press.*

CARE OF THE HANDS.—There are not nearly as many secrets in hand treatment as people imagine. A little ammonia or borax in the water you wash your hands with, and that water just lukewarm, will keep the skin clean and soft. A little oatmeal mixed with the water will whiten the hands. Many people use glycerine on their hands when they go to bed, wearing gloves to keep the bedding clean; but glycerine does not agree with every one. It makes some skins harsh and red. These people should rub their hands with dry oatmeal and wear gloves in bed. The best preparation for the hands at night is white of egg with a grain of alum dissolved in it. Quacks have a fancy name for it; but all can make it and spread it over their hands, and the job is done. They also make the Roman toilet paste. It is merely white of egg, barley flour, and honey. They

say it was used by the Romans in olden time. Any way, it is a first-class thing; but it is a sticky sort of stuff to use, and does not do the work any better than oatmeal. The roughest and hardest hands can be made soft and white in a month's time by doting them a little at bed time, and all the tools you need are a nail-brush, a bottle of ammonia, a box of powdered borax, and a little hue white sand to rub the stains off, or a cut of lemon, which will do even better, for the acid of the lemon will clean anything.

IS THE BARK OF THE LOCUST TREE POISONOUS?—The inner bark of the fragrant flowered locust (*Robinia pseudacacia*), commonly cultivated as an ornamental tree, and for its valuable timber, has long been known to have a sweetish taste, resembling that of licorice, and to have emetic and cathartic properties. But we believe it has never been considered poisonous. In the *New York Medical Journal* of January 22d, Dr. Z. T. Emery reports a case of poisoning of 32 boys at the Brooklyn Orphan Asylum from chewing some of this bark, which they had obtained from fence-posts in the yard. In the mildest cases, vomiting of rosy mucus was observed, together with flushed face, dryness of throat, and dilated pupils. In the severest cases, large quantities of rosy mucus mixed with blood were vomited. The other symptoms were retching, pain in the epigastrium, debility, stupor, cold and pulseless extremities, a feeble and intermittent action of the heart, dilated pupils, and face of a dusky pallor. The patients were given subcarbonate of hydrogen and brandy by the mouth, and morphia hypodermically; sinapisms were applied over the stomach, and bottles of hot water along the extremities. The patients were discharged from the hospital in two days.

WHERE TO DIG THE WELL.—Let us remember that a well will drain an area with a diameter equal to twice its depth. Therefore, a well 12 feet deep will drain an area the diameter of which is 24 feet, that is to say, that it will drain the surrounding soil for 12 feet in every direction. Obviously then the privy should be more than the depth of the well away from it, and more than this again if it is proposed to place it on a higher level, which, however, should never be done. The well should be lined inside thoroughly with mortar so that percolation cannot occur between the crevices of the bricks, and it should be well covered, so that surface drainage cannot get into it, for you want to drink water that has come into the well from the bottom, after it has been purified by filtration through the earth. Thus, then, these are the precautions to be observed in locating and building your well in the country. How about the city? Well-water in the city should never be used; the sources of contamination are too numerous and too hidden to be avoided. —*Annals of Hygiene.*

A MODERATE USE OF TOBACCO.—The use of tobacco, as distinguished from its abuse, ought to be a matter of intelligent observation and experience. We should incline to the opinion that any particular individual who can say, "I always know when I have smoked enough—if I go beyond the just limit I lose my power of prompt decision," had better not smoke at all. It is clearly unwise for a man who cannot swim to persist in dabbling in deep waters. There are currents and under-draughts which may at any moment destroy his balance. The very reverse of the complaint made by this person is the experience of most smokers. A moderate use of tobacco soothes the senses and leaves the mental faculties free from irritation and ready for calm, clear intellectual processes. When this is not the effect produced by smoking, the "weed" had better be eschewed. —*The Lancet.*

TO DEVELOP THE LUNGS.—If a person's lungs are not well developed, the health will be imperfect, but the development may be increased several inches in a few months by daily outdoor runnings with the mouth closed, beginning with 20 yards and back, at a time, increasing ten yards every week, until 100 are gone over twice a day. An ensthite for ladies and persons in cities is running upstairs with the mouth closed, which compels very deep inspirations, in a natural way, at the end of the journey. Of course, such violent exercise should never be resorted to where there is any tendency to heart disease.

MIND AND HEALTH.—The mind depends for its health very largely on bodily conditions. The gloomy fears, the deopendent views, the weariness of soul that many complain of, would often disappear were the blood made pure and healthy before reaching the delicate vessels of the brain.

RESPONSIBILITY OF LANDLORDS.—A mother and four children recently recovered damages from a landlord in Boston for sickness resulting from bad sanitary arrangements of their house, ranging from \$200 for one child to \$1600 for the mother.

SWEET OIL TO PREVENT SCARS.—In the healing of burns and scalds, where there is danger of contracting scars, rub the new skin several times a day with good sweet oil. Persist in this rubbing until the skin is soft and flexible.

BREAD FRESH AND STALE.—Fresh bread is not allowed in the British army. It must be at least 12 hours old before being used as food.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

EMPIRE.—Amador Ledger, May 7: An immense air chamber was placed in the Empire mine of Plymouth on Tuesday. It is 54 feet high, and 42 inches in diameter, and of steel. The object is to take the immense pressure off the water pipe when the water is suddenly shut off from the works. The first one put in worked so satisfactorily that the company concluded to try another of the same size. An expert machinist was sent up from San Francisco to put it together, and to superintend its erection. It came up in three sections, weighs about seven tons, and cost something like \$2500. Sinking is in progress at the Olive mine at Drytown. It is said that the yield of ore from this claim crushed at the five-stamp mill erected on the property, was more than sufficient to pay running expenses. Some 20 men are now working at the big tunnel property at Middle Bar. A small crushing of 18 tons of rock from one of Spagnoli Brothers' claims near Clinton, yielded a trifle over \$3 per ton. The rock was taken from an old dump pile, and a large percentage was dirt. The yield is considered satisfactory. Water-power hoisting works are to be erected on the Middle Bar mine. We are informed that the shaft is 50 feet deep, and that some good-looking ribbon rock is being taken from the bottom.

SOUTH SPRING HILL.—Amador Sentinel, May 5: One of the best paying mines in this county is the South Spring Hill, at Amador City. Its levels are opened at depths of 500, 600, 700 and 800 feet, the ore body being from one to 50 feet wide, and paying from \$3 to \$40 per ton. Thirty stamps crushing 70 tons per day are kept constantly running. Steel tappets, shoes and dies are used, and the Frue concentrators, Challenge ore-feeders and Blake rock-crushers are in place at the mill. In the mine the National air drills are used. The compressor is stationed at the mill, 2000 feet away, and is fitted with an automatic gate, there being no blow of escape steam or air. When the miners stop using the air drill and the pressure gets to 90 pounds on the gauge, the compressor stops, and when they begin to use the compressed air, the pressure falls to 65, when the gate will open of its own accord. The superintendent, John R. Tregloan, deserves credit for the persistency with which he stayed by his faith in this mine, under discouraging circumstances, until the bonanza was finally uncovered.

SUTTER CREEK.—Cor. Amador Ledger, May 7: The change in the proprietorship of the Mahoney will no doubt lead to the resumption of work in the shaft in a few days. The water will be taken out for about 300 feet to begin with, and as soon as one or two levels have been put in good working order, they will drain the shaft deeper with the view of getting other levels in operation. John McIntyre will likely recommence work on the claim between here and Amador City in a short time. Everything at the Wildman is running favorably. The water is down about 150 feet, and before it can be lowered much further, the large hydraulic pump will have to be placed in position. Laying the pipe from the Amador canal to the Kennedy mine is making satisfactory headway; they expect to have it completed this week.

El Dorado.

MORRIS.—Mountain Democrat, May 7: Among the mining properties in this county coming rapidly forward is the Morris claim, near Latrobe, formerly well known as the Larison mine. This has been pushed forward rapidly of late and considerable work done on it. New and extensive machinery has lately been put upon the claim, with a view to sinking to a greater depth. The shaft is already down 200 feet, and we understand to be sunk 300 feet further at once. The owners of this property are Santa Clara county men, and have faith enough in the value of their property to put extensive machinery on the claim and thoroughly prospect it before putting up a mill.

Mariposa.

SAXTONS CREEK.—Cor. Mariposa Gazette, May 7: There is good news from the Buena Vista mine; it is reported that they have struck good ore. When you have a capable manager to take hold of a mine and sufficient means behind him, you may look for a good result. The recent development will put the Buena Vista among the most promising mines of the county. There are plenty of good mines in the vicinity; all that is lacking is capital to develop them. The deepest shaft in any mine, in this part of the county, is the one at the Buena Vista, 200 feet deep. Almost all the work done on the mines here is like a gopher's burrow, near the surface. These mines are only waiting for capital to be a bonanza for those who will take hold.

Mono.

THE BODIE.—Miner, May 9: The east crosscut, 900 foot level, was driven 18 feet, through very favorable rock; and south drift was started and run 11 feet upon a vein which shows some fair ore. Having succeeded in getting the water out, are now replacing tracks, switches, etc., on the 100-foot level, and the work of prospecting this portion of the mine will be vigorously prosecuted. There were employed five miners, and jointly with Mono, three engineers, three firemen, two carmen, one carpenter, four miners, one pumpman, two shaftmen, one watchman, one foreman, and jointly with Mono and Bulwer, one blacksmith, one helper.

Nevada.

NORTH BLOOMFIELD.—North San Juan Times, May 6: The Derbec mine gives employment to about 130 men. They are worked on two shifts. Wm. M. Davis is boss of the day shift. S. Galavotti is the general superintendent. The mine is paying very largely, and it is worked as economically as it is possible to work it.

NORTH BLOOMFIELD is the liveliest town in the county. Its close proximity to the Derbec and Mabel makes it so. It is the headquarters for all the people in that section of the country. While at Bloomfield we met our old friend General Dobbie. The General read us a lecture because we will not advocate the closing of drift and quartz-mine, and because of our position on the Hobson matter. The General is in favor of a dog-in-the-manger pol-

icy; that is, if you can't eat bay yourself, nobody else should be allowed to do so; if he can't mine by the hydraulic process, no other person should be allowed to mine by any process. This is a kind of policy we can't sustain. It is a sickening sight to see the North Bloomfield mine lying idle. There are millions of dollars almost in sight, and yet the gold cannot be taken out of the earth because of the enmity of Judge Sawyer to hydraulic mining. Could the North Bloomfield mine be worked by the hydraulic process, hundreds of idle men would be set to work, and very soon millions of dollars' worth of gold that is now lying dormant in the ground would be circulated among the people.

MOVING A MILL.—The 10-stamp mill heretofore on the New England or Thomas mine is being removed to the Oro Fino mine, where it will be used in crushing the large and rich ore body recently found in the latter claim. Messrs. Robinson & Battey have had much to contend with in putting their property in its present splendid condition, but the indications are that their perseverance and energy will not go unrewarded.

RESUMED WORK AT THE PEABODY.—Transcript, May 10: Some other men have been found to take the place of the lessees who quit operations Saturday, at the Peabody mine, in Grass Valley district. The bottom pump, which had been pulled up, was to be replaced yesterday.

Placer.

FOREST HILL DIVIDE.—Placer Herald, May 7: Although there is no excitement in mining circles, a great deal of work is being done quietly in prospecting and opening the mines. At the Mountain tunnel they are running drifts in various directions. Breece & Wheeler are prospecting their way to the famous upper lead. Mr. Dodge has extended the Baker Divide tunnel 2500 feet into the main ridge and is getting ready to make an upraise. Col. J. H. Keown intends to pierce the Hazard mine by means of a tunnel, which will involve a smaller expenditure than the present way of working. Through the kindness of Mr. Chapellet, we had the pleasure of visiting the new tunnel and seeing the machinery that is extending the tunnel up Brushy canyon to the famous Mayflower mine. On the failure of Mr. Boyle to complete the tunnel, the company authorized Mr. Chapellet to prosecute the work according to his own plan. Mr. Chapellet immediately set to work and had got the water under control, and was confident he would have the shaft emptied by the middle of this week. The shaft is 326 feet deep. The air-compressor and hoisting works are at the top of the shaft and are under one roof. Leading from the compressor is an iron pipe which stretches 4200 feet down the canyon to the mouth of the tunnel, which it enters and conveys the compressed air 2200 feet up to the head of the tunnel, where it operates the Burleigh drills. Mr. Chapellet is preparing to erect another compressor at the mouth of the tunnel. The length of tunnel so far run is 2500 feet, the height eight feet, and the width for the first 300 feet is eight feet; the bore gradually narrowing to six feet from this point. The grade is one-half inch to the rod. The tunnel is in a slate formation and is remarkably dry. The cars run on T rails and are switched at regular intervals. In a short time horse-power will be substituted for man-power in running the cars. At the mouth of the tunnel is a fan which forces the outside air through an iron pipe up to the face where the men work. This constant current keeps the air fresh and wholesome. About 1500 feet below the mouth of tunnel is the Live Oak mine. Mr. Chapellet will have completed the mill by this writing. The mill will be run by the tunnel and the canyon water, which is caught and stored in reservoirs ready for use. The tunnel is in 1500 feet and pierces a rich body of gravel. The company employs about 30 men. The force will be increased as soon as circumstances permit.

Plumas.

ATTACHMENT.—Greenville Bulletin, May 5: Last week the Round Valley Water Co. attached the Plumas Con. M. and M. Co. for something over \$4000, and Judge Goodwin has begun proceedings to foreclose a mortgage on the Union quartz-mine and mill.

Shasta.

COPPER CITY.—Courier, May 7: Copper City has probably had more ups and downs, mostly downs, than any other quartz-mining camp in Northern California. The first quartz mines were discovered there on Kellinger bill, in 1862, by J. P. Williams, followed soon after by the discovery of the deposits on Bully bill. Copper City grew up like magic. Citizens of Shasta and Red Bluff alone had about \$200,000 invested in the district. All at once the mill and mines closed with a snap. At the close of 1864 there were not two dozen voters left in the district. This desertion continued until about nine years ago, when the mines took another boom. A large quartz-mill, sawmill, three-mile railway, etc., was built, and another booming, blooming town sprung into existence on the old site. But, to the surprise of all, the mill and mines were shut down, the machinery soon hauled away, and Copper City again almost deserted. Some months ago it was given out that the Wintrop Co., backed by abundant capital, would not only make a large new plant of machinery, but proceed to work the mines on a large scale by the most approved appliances known to practical and scientific mining. The last reports from there, however, are not encouraging as to the progress of the company, but we hope to chronicle good news from the district soon.

Sierra.

TUNNEL.—Mountain Messenger, May 7: The new South Fork tunnel, at Forest City, is in 2000 feet, and the face is in bedrock. The presumption is that pay gravel of the deep, lava-capped channel is above, and an upraise will be made, when, if it is so, the ground will be opened out for thorough development.

YOUNG AMERICA.—The Young America Co. cleaned up \$31,000—the first good returns since the mill started, about the middle of March. The timber contract for the Young America quartz mine has been awarded to Mr. Martin, of Truckee. The contractor is to deliver 70,000 feet at 8½ cents per foot, at the mine.

Trinity.

EASTMAN'S GULCH.—Journal, May 7: From Mr. Jas. Feour, of Eastman's gulch, we learn that quartz interests in that section are developing very

favorably. The mill on the Venicia mine will be completed about the 15th of this month. As the mill will do custom work, it will be of great advantage in giving a working test of the value of the many ledges in that vicinity. Quite a lot of ore is now there waiting to be crushed. Jas. Fisher, of the Nob mine, has from 75 to 80 tons of fine-looking rock on his dump; Feour & Forcade, lessees of the Newman, have eight tons of very rich quartz; Hill & McGiffin have about 100 tons of good-looking ore ready for working; Tom Leas has about 37 tons out with plenty more in the vein; Hamilton & Gifford have abandoned the tunnel which they have lately been running and are now working on the old Blanket ledge, from which they are taking very good rock. On the whole, the outlook for a busy spring in that camp is very good; there are quite a large number of men there now, and more will follow as the weather is favorable for prospecting.

NEW RIVER.—Last Saturday we received a visit from Mr. Dow, who had just returned from New River, and from whom we gathered the following facts. Notwithstanding the heavy fall of snow, work has progressed steadily in the mines all winter, and a good lot of ore showing free gold has been piled on the dumps. The snow has disappeared and five mines are now running, hampered only by lack of miners, for whom there is quite a demand. The small stamp-mill on the Ridgeway crushed out about \$10,000 during the past four months. Mr. Dean, superintendent of the Ridgeway, has just discovered a six-foot ledge on the property, which shows every sign of permanency and which will be of great value in establishing the status of the camp. Good ore from the Tough Nut and Mountain Boomer is being crushed by their respective arrastras, each with a capacity of about a ton a day. It is estimated that 600 ounces of dust is being shipped each month, and the outlook for the increase in number and value of the mines is most favorable. The camp has a bright future before it in prosperity and permanency.

EAST FORK.—Trinity Journal, May 7: Mr. Dedrick showed us some very rich specimens from the Saturday Night mine in the East Fork district, owned by Dedrick, Farmer, and Knowles. The rock was very rich, being mostly gold. They have been working the mine but a short time and have run a tunnel in on the ledge about 35 feet, and have taken out about six tons of rock, all of which shows free gold. They have a well-defined ledge ranging from six inches to two feet in width, the vein, where richest, being about 12 inches wide. Work will be pushed on the mine till it is well opened.

HAY FORK QUARTZ.—The 20 tons of quartz from the ledge of Searls & Rennie, which has just been crushed in Mr. Shattuck's mill, yielded \$20 to the ton. A few tons from the Magdalene yielded about the same. This test shows that the mines are valuable.

Tuolumne.

THE CARDINELL MINE, TUTTLETOWN.—Tuolumne Independent, May 7: This mine was discovered and worked as early as 1853, by a company of Mexicans, and afterward came into possession of John Cardinell, whereby its name. Cardinell worked the mine off and on, up to about the year 1857, realizing from it large returns, since which time, and until very recently, when Messrs. W. G. Long and Jos. Hampton took hold of it, the mine had practically been abandoned. It may be looked for, that under management of these two gentlemen the mine will speedily be developed, and it is reasonable to presume that there still remains untold wealth in this old and almost forgotten mine. A force is already engaged clearing out the old shaft, though which the mine was worked, and retimbering it preparatory to sinking it below the old workings, which was only carried down below the outcroppings about 40 feet. The prospector of to-day is too apt to pass an old abandoned mine, giving it simply a hurried glance, with that familiar phrase, "it is played out." The mines that were worked in early days, and said to be worked out, are to-day, we may note, some of the most valuable in the county.

JUNIATTA.—Union Democrat, May 7: W. N. Harris has struck a chute of valuable ore in the Juniatta mine, which is situated between the Crystalline and Gem mines near Jamestown. Alvina Hayward and Mr. Hobart were in the county this week looking at mining property in the direction of Summerville. Mr. Hayward is operating already in the county.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—Virginia Enterprise, May 7: On the 1300 level the drift started last week in the north drift from west crosscut No. 1, at a point 91 feet from its beginning. It is going in a northeasterly direction, and is now out 61 feet. On the 1400 level, ore stopping in the body of ore found in a west crosscut from the main south drift 200 feet from the Con. Virginia shaft. The body is showing strength, and the ore it yields is of good quality. On the 1435 level continue stopping out ore from the bottom of winze No. 2, 165 feet south from the south line of the Ophir mine. The gas furnace still continues to work well as far as can be judged. The natural draft is being assisted by a blower, and that such assistance is necessary seems to indicate that all the openings have been pretty well filled with the carbonic acid gas to and for some distance above the 1700 level. At present there is every indication that the plan will prove successful. During the past week the usual quantity and quality of ore has been shipped to the Morgan and Eureka mills, on the Carson river.

SAVAGE.—The upraise in the ore body from the 600 level has been advanced 14 feet, and the ore chute is completed to the tenth floor. The winze in the ore body has been sunk and timbered 13 feet, and is now 78 feet below the sill floor of this level. On the 1200 level the north drift was advanced 25 feet. In a further distance of 60 feet, this drift will connect with the company's shaft. During the week there were 430 tons of ore hoisted from the 600 level.

BEST AND BELCHER.—On the 800 level west crosscut No. 4 was extended 40 feet; total length, 390 feet. The face continues in a mixture of porphyry and clay, with some quartz of a favorable appearance. Crosscut No. 2 has passed through a great breadth of clay, and the material in the face (por-

phyry) is still largely mixed with clay, though some stringers of quartz are beginning to be seen.

OPHIR.—On the 1055 level west crosscut north from the south drift was extended 20 feet; total length, 294 feet. This crosscut is still showing vein material and quartz. On the 1300 west crosscut No. 1, from the northeast drift, was advanced 24 feet; total length, 65 feet. A hoist engine is being placed at the head of winze No. 2, which is being sunk below this level in the north drift.

IOWA.—The ore portions show well. The mill tunnel will be connected with boulder drift early part of next week, and ore run through that tunnel to mill. Grading for mill is completed, and most of the heavy timbers for machinery are framed. The two rocker quartz-mills, rock-breaker and other machinery are in transit from San Francisco.

CROWN POINT.—Miners are gradually being put back into the ore-producing sections, though there is still a lack of facilities for milling all the ore that might easily be extracted. Meantime the prospecting drifts are finding some deposits of ore that promise to become valuable.

YELLOW JACKET.—The daily yield of ore is about 200 tons, all of which goes to mills on the Carson river. This ore—at least the greater part of it—is taken from the 1300 and 1400 levels. Above these levels prospecting work is being done all the way up to the roots of the sagebrush.

HAYWOOD.—Sufficient ore is being extracted to keep the Thompson and Briggs mills running. Two or three other such mills might easily be run could they be obtained. Last Wednesday a bar of bullion worth \$6202.94 was sent to the Carson mint; also, a sack of crude bullion which was mostly gold.

CHOLLAR.—Ore is being regularly hoisted at the Sharon shaft on the croppings. The old incline is being cleaned out and put in good working order. This is being done from the Hale and Norcross side. The incline was found considerably caved in several places. Other work is progressing as usual.

BELCHER.—Less than the usual amount of ore is being extracted, as part of the force of miners has been laid off, but there is plenty of ore in sight that will be extracted as soon as satisfactory arrangements for milling have been made. Also, some new deposits of ore are being opened up that promise well.

MEXICAN AND UNION CON.—On the 1300 level the joint Union and Mexican drift running northeasterly was extended 22 feet. This drift is now 44 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 18 feet; total length, 410 feet.

SIERRA NEVADA.—On the 520 level west crosscut No. 9, from the north lateral drift No. 2, 160 feet south from west crosscut No. 1, was extended 65 feet; total length, 228 feet. The face still continues in vein material composed largely of porphyry and clay.

GOULD AND CURRY.—On the 625 level the east crosscut from the main south drift was advanced 30 feet; total length, 222 feet. At a point in this crosscut, 33 feet east from the main south drift, a station is being excavated preparatory to sinking a winze.

BALTIMORE.—The work of cleaning out and repairing the old drifts on the 400 level is progressing as usual. On the 300 level a raise is being made in the vein to tap the 225 level. The work of drifting on the 500 level will soon be resumed.

BULLION.—On the 200 level are drifting south on the east vein. The face is in a promising material. On the 300 level are drifting east for the east vein. The drift south on the west vein on this level is showing some very promising quartz.

OCCIDENTAL.—On the 90 level, in the lower tunnel the north drift from No. 2 upraise was extended 15 feet; total length, 209 feet. No. 2 west crosscut was advanced 10 feet. All of these openings are in quartz of low value.

JUSTICE.—The financial statement of Secretary Kelly, presented at the annual meeting, showed that for the past year the receipts had been \$13,250.14 and the disbursements \$10,049.40, leaving a cash balance of \$3200.40 in the treasury.

ANDES.—Are sinking an incline from the 240 level on the ore body. The ore still continues of good quality. A west crosscut on this level at a point 75 feet north of the incline is still in vein porphyry.

SCORPION.—On the 300 level the east drift is now advanced 355 feet from the station, having been extended 20 feet since last report. The formation in the face of the drift is vein porphyry, and shows some water.

UTAH.—On the 472 level the north drift from the main west drift was extended 41 feet; total length, 741 feet. The face still continues in vein material, composed principally of porphyry and clay.

ALTA.—On the 825 level the west drift is out about 400 feet. It is being advanced at the rate of 11 feet a day. It has yet about 100 feet to go to reach the point where it is expected that the vein will be cut.

HALE AND NORCROSS.—About half the force of miners has been employed in repairing the incline of the Chollar mine. It is found to be badly caved above the 1200 level.

VIVIAN.—A considerable amount of ore that will work about 30 a ton is being taken out and piled up on the dump.

LADY WASHINGTON.—Good progress is being made in the north drift on the 725 level. It is now out a distance of 425 feet.

MOORE AND MORGAN.—Work will shortly be started up under the superintendence of Col. S. T. Curtis.

BENTON.—Are making an upraise from the 725 level in the old Keystone vein.

Cherry Creek District.

LOOKING BRIGHTER.—White Pine News, May 1: From Dr. Campbell, from Cherry Creek, we learn that the prospects of the old camp are brightening, and it looks as if considerable work of a remunerative character would be done there this summer.

Eureka District.

ORE SHIPMENTS.—Eureka Sentinel, May 8: During the past week ore shipments were made from the mines of the district to the Richmond works—Dunderberg mine, 65 tons; Silver Lick, 15

tons; Queen, 6 tons; Grant, 5 tons. Eureka Con. —Reveille mine, 2 tons; Macon City, 15 tons; Star, 1 ton; Fraser & Molino, 8½ tons; Alexandria, 28 tons; Tybo, 1 ton.

Gillis Mountain District.

ORE.—Esmeralda *News*, May 4: E. Prince shipped 10 tons—a carload—of ore from the Burnley mine, in Gillis Mountain district, to the Reno Reduction Works. He will have another carload for shipment in a few days.

Gold Mountain District.

ANOTHER NEW MILL.—Esmeralda *News*, May 4: The Coronet Mining Company owns the mines known as the Blinn and Stewart series, at Old Camp, Gold Mountain district. It has commenced work on the mine formerly owned by Wm. Neighly, and has a shaft down 50 feet, showing a good ledge all the way down. The company has had machinery (which remained at Candelaria for a long time) shipped to a point 15 miles beyond Old Camp, where a mill is intended to be erected to reduce ore from the company's mine. The mill will be built beyond the line of this county; it will be in Nye county, but will be dependent upon the mines of Gold Mountain in this county for ore to keep it in operation. There is every prospect for better times in southern Esmeralda this summer.

Montezuma District.

FAVORABLE.—Esmeralda *News*, May 7: The indications are favorable for lively times in Montezuma this summer. Mr. Nicolson, president of the Montezuma M. & M. Co., is expected to arrive from San Francisco within a few days. The Montezuma Company is having its mill put in thorough repair, and two concentrators added thereto. The company has purchased the Tilden Hoisting Works, formerly owned by M. Swartz of Columbus, and it is now being shipped and put up on their mine at Montezuma.

Northumberland District.

STRIKE.—Belmont *Courier*, May 7: A very rich strike was made in Northumberland district, this county, last week. Several specimens of the ore were on exhibition in George Nicholl's assay office last Sunday, and quite a number of persons examined them. We are informed by Mr. Nicholl that the lowest assay gave over \$100 in silver to the ton, and the highest went over \$100 to the ton. This is remarkably good ore, and we hope that the owners of this claim will realize a fortune from it. They have been indefatigable prospectors, and they deserve a rich reward for their labor.

Palmetto District.

IMPROVING.—Esmeralda *News*, May 7: The southern portion of this county is rapidly improving; the several mining camps in that section will soon be the scene of active operations. At Palmetto district there is every indication of prosperity. The mines are looking well. The New York and Palmetto Mining Company owns several valuable mines, which show large quantities of milling ore on the dumps. The ledge on the St. Louis is stripped on the surface for more than 50 feet, showing a strong, well-defined ledge, averaging three feet wide. The ore assays from \$100 to \$300 per ton in gold. In the 250-foot level of the Silver Champion mine a two-foot ledge of rich ore has recently been discovered. The Jersey Blue mine, northwest of the Champion, is also looking well. The company owns many other claims in the district upon which very little work has been performed, but it is rumored, arrangements are being made to operate these mines on a large scale. There is an abundance of wood and water in the district, and should suitable reduction works be erected, regular shipments of bullion of considerable magnitude would be made.

Reveille District.

ENCOURAGING.—Belmont *Courier*, May 7: The mining outlook in Reveille district is very encouraging. Good reports come from all the mines, and the work of development is pushed vigorously by the owners.

Robinson District.

LOOKING UP.—White Pine *News*, May 5: This district is coming to the front with some important ore discoveries. Considerable prospecting is being done there now, and we look for good results ere summer is over. The location of the county seat at Ely is helping to interest prospectors and capitalists in the great mineral belt of that section, where vast quantities of low-grade mineral can be seen on the surface for miles around. Robinson will furnish the ore and wood and Ely the water-power for reduction works. It would not surprise us to see a population of 500 or more gather in and around this center before a year passes.

Tuscarora District.

THE GRAND PRIZE.—*Times-Review*, May 7: Active operations in the way of developing and prospecting the Grand Prize mine at various points on the 300-foot level and upward will be resumed during the present month. Nearly the entire western half of the original Virginia location, in which the first large ore body of the Grand Prize was found, remains to the present time untouched and unprospected, and virtually virgin ground, and it is this portion of the mine that attention will be first directed to, and be opened up by levels and crosscuts. Other portions of the mine above the 300 level, already opened, will also receive attention, and stringers passed by in earlier days will be followed to their termination. Several bodies of ore, though comparatively of low grade, which are known to exist in the mine, will also be looked after with a view to their future reduction. During the past two months, Superintendent H. W. Coffin, with a small force of men, has been quietly but steadily at work restoring order from the chaos which has existed around the premises since the destruction of the large hoisting works by fire two or three years ago, and from the blackened and twisted mass of ruins has, at a comparatively slight expense, restored the machinery to a condition none the worse from its bath of fire.

Tybo District.

ORE.—Belmont *Courier*, May 7: Considerable good ore is being extracted from the various mines in Tybo district.

ARIZONA.

CATARACT CREEK.—Prescott *Courier*, May 5: Cataract creek mining district is looking up. This

district is situated about 60 miles north of the A. & P. railroad, near the Supai Indian village at the Grand Canyon. There are 40 or more locations there, about 15 of which are being worked. The ore carries 60 ounces of silver to the ton and about 75 per cent lead. Some gold is also found, as well as good indications of placer diggings. Bud Dillon and a party of prospectors started for this district yesterday morning.

GOLD.—Prescott *Courier*, May 5: There are 28 free gold bearing ledges in Centennial district, with veins from 2 to 10 feet wide. Mr. Holbrook, an expert from El Paso, Texas, representing an English company, is there looking at the mines of Messrs. Tride, Hayard & Harris, said to be valuable properties capable of running 20 50-stamp mills. About 60 miles from Prescott and about 25 miles from the sink of Date creek are some rich copper properties upon which a St. Louis company intended to erect four 30-ton smelters. A big dam for ranch and mining purposes is to be built on Bill Williams Fork 30 miles above its mouth and five miles from the Planet mine.

TOMBSTONE.—Democrat, May 5: At the Grand Central the excavating for the large engine will be completed in five or six days, when the ground will be opened for the foundation. Sinking in the new shaft will be resumed on Monday or Tuesday. Steam has been raised in the boilers that passed through the fire, and found to be in good order. A temporary engine-house has been erected and ready for work.

GRAND DIPPER.—The shaft has 175 feet of timbering in it. A new station will be opened at 169 feet. The company intends to sink the shaft at the rate of 150 feet a month. The last 12 feet of the shaft has been sunk on a vein about 15 inches wide, of ore that will average from 50 to 90 ounces per ton, and go some 15 per cent lead. This is evidently the Grand Central lode, as their south drift is within 100 feet of the Dipper shaft. Striking this vein was somewhat unexpected.

BOSS.—This mine is looking very well. The stops above the 100-foot level are looking well, some 100 tons having been shipped from them last month. Drifting on the vein from the 200-foot level is being continued.

MAINE.—From 25 to 30 men are constantly employed at this mine. The vein remains about the same, and of the same high grade which has heretofore characterized it.

BISBEE.—Tombstone *Democrat*, May 7: The Copper Queen is working over 100 tons per day, and more ore is being extracted than the smelter will run. As usual this company keeps at least two years' ore reserve in sight. There is now in course of erection a new concentrator, comprising 12 jigs, 4 crushers, and 12 revolving screens, which will be in operation in about 60 days. The new smelter, which will have a capacity of over 100 tons per day, will be erected as soon as possible. Men are now employed on the foundation. This company has about 275 men on its payroll and it is the prime factor in the prosperity of the place. The Czar mine hoist is the only one now in operation, although the Atlanta will probably be started up in the near future.

COLORADO.

CRESTED BUTTE.—*Elk Mountain Pilot*, May 5: The Excelsior mine shipped another car of ore yesterday. It goes to Denver. Work is still progressing at the Eila in Redwell. The ground is softer, the vein wider, and the mineral slightly improved. Mr. Geer went to Pittsburgh last Thursday to look around and see what the prospects were for getting to work on his mines in the near hereafter. He expects to do considerable development work on the Monitor. Mr. J. Mott, of Denver, has purchased the Pioneer stamp mill at Irwin, and will put in some tables as soon as the road opens. He has also taken a lease, we are told, on the Eureka and Ella mining property on Ruby hill for five years, and will do considerable work. The lease calls for the sinking of two shafts, each at least 100 feet in depth. Work has been suspended on the Fairview on Ruby hill for the present. Negotiations are pending looking to a renewal of operations. The Old Lot mine, in the Cebolla district, has been bonded to W. J. Fine and A. K. Stevens, of Gunnison.

COKE.—The C. C. & I. Company here is now burning 150 ovens making coke. Each one of these ovens is charged with 3½ tons of slack coal, and then burned for 48 hours. From each of these ovens, when burned, 2½ tons of coke are obtained. The ovens used are the "bee-hive" pattern and are built in two blocks or rows, with two ovens width of each row.

IDAHO.

THE REDUCTION WORKS AT WARDNER.—*Helena Herald*, May 1: S. G. Reed, the Portland millionaire, is here to perfect negotiations with the Helena Concentrating Company by paying over the purchase price for their reduction works at Wardner, Idaho, and the lease they had upon the Sullivan and Bunker Hill mines. These great ore-producers of the Cœur d'Alene country have been purchased by Mr. Reed at a cost of over \$600,000. The Helena Concentrating Company alone, including Messrs. Hauser, Holter, Esler, Cox and Corbin, receive \$123,000 for their plant and interest in the property. These Helena capitalists went into the project last year, and now withdraw from the enterprise with great profit, considering the amount invested and the period of work. The purchaser of the mines will erect additional works and proceed with the development of the property on an extensive scale.

TIP TOP AND DEADWOOD.—Wood River *Times*, May 5: The Tip Top and Deadwood developments continue to be the talk of prospectors and miners on the Gold Belt. The Tip Top is now opened by a shaft in the ledge which is down 100 feet. At that depth a level is opened which is already 300 feet long. Both shaft and drift are in ore all the way, the vein, wherever crosscut, showing a width of from 10 to 20 feet of free-milling ore, which, at a low estimate, will yield \$15 to \$20 per ton. A tunnel that will tap the Deadwood vein at a depth of 150 feet is to be commenced in a few days. Another development which is exceedingly encouraging is that made on the Benson. This claim is on the same vein as the Tip Top and Deadwood, and might be called an extension, since only

a 200-foot fraction lies between. This tunnel is now in 60 feet, and shows six feet of good ore (supposed to be similar to the Tip Top) in the face.

THE COMET.—Wood River *Times*, May 5: The people of Crichton and Soldier, on Camas prairie, are greatly elated over the developments made in the Comet mine, on Deer creek, in the foothills back of Crichton, by Mr. Schroder, of Soldier. After sinking a 14-foot shaft in the vein, Mr. Schroder drove a 50-foot tunnel from the bottom, and ascertained the ledge to be six feet wide, and to carry free-milling ore that assays \$133.10 in gold per ton.

CAMAS No. 2.—Dr. McKay is showing some rich specimens of chloride and black sulphure ore which he dug with a pick a few days ago, out of the Camas No. 2 mine at a depth of 400 feet.

FLINT.—We hear that not only the Flint and Idaho Mining Co.'s mines at Flint are showing up splendidly, but that private properties are as well. The Old Squaw, Old Judge and Way and Grete's mines are said to contain very rich ore, and that the ledges grow larger, and the ore richer, as work is done on them.

KETCHUM NOTES.—*Keystone*, May 7: The Philadelphia and Idaho Co. has established a rate of \$34 per ton, working charges, on ores to be sent to its works for reduction this season. This is the same figure charged last year. It is anticipated that the full capacity of the works will be called into requisition during the summer and fall, and both furnaces will be put in thorough order. The most important feature of the week's business is the contract made for the receipt of the ore of the Carrie Leonard mine, of Smoky district, at the company's works here. The shipments will amount to about 10 tons per day as soon as the road is opened. The ores of the Dollarhide mine will also come to this point for reduction, and the product of several other mines will also be sent this way.

THE LUCIA.—This property, situated on East Fork, and owned by Theo. Olsen, is showing good results. A tunnel 300 feet in length has been run, and a level extends on the lead a distance of 60 feet, where a shaft has been sunk 50 feet. At the bottom of the shaft a drift of 27 feet has been run. Ore is found all through the lower workings. A small lot of ore from the Quaker City was brought to the smelting works during the week. A shipment of ore from the Noonday mine, in Elkhorn gulch, has been received at the Ketchum Sampling Works. The Occidental, in Greenhorn gulch, under lease to Frank Bynum and Hugh Freelin, is making a favorable showing.

GOLDEN DAWN GROUP.—Cœur d'Alene *Record*, May 7: The Golden Dawn group of mines are looking splendidly, and a sale can be considered an assured fact unless something very unlooked for occurs in future development. The men are now working on the Horseshoe claim, the eastern extension of the Golden Dawn. The ledge is between six and seven feet in width—all clean ore between well-defined walls. The tunnel gains one foot in depth for each foot it penetrates the hill.

DREAM GULCH NOTES.—Lane, Landes & Shields are ground-sluicing on No. 1 consolidated old wash placer claim on the west side of Dream gulch. Considerable gold was taken out of this claim last year, and as they have it well opened, there is no doubt but what they will get plenty of the yellow dust this year. There are a number of big boulders in the claim that have to be blasted to get them out of the way. On the east side of Dream, Wm. Ray and Columbia Jim are working an old wash claim, sending the gravel down from a pit through a chute to where it is sluiced in the gulch. West of Dream, high up on the hill, Mr. Gay is bringing in a ditch for the purpose of working the Gilbert claim.

MONTANA.

THE ARGENTA BONANZAS.—Butte *Miner*, May 2: Hugh McDonnell, who negotiated the sale of the Rena and Golden Era mines at Argenta, returned this morning from St. Louis, having stopped a few days at Argenta on his way to Butte. It is the purpose to push work energetically, and to this end hoisting works will be at once constructed on the Golden Era (the Rena already has a hoist), and the extraction of ore will go steadily on. Both properties show good bodies of high-grade gold ore, averaging, Mr. McDonnell says, \$100 per ton. This, of course, suitable for shipment, and will be shipped to Denver or Omaha, it not being the intention of the company to build a mill at present. There has already been shipped from the Rena something over \$15,000 worth of ore.

BUTTE NOTES.—*Miner*, May 7: Only the day shift is now being worked at the Stewart mine, situated in Dublin gulch. The new shaft in the Cora mine will be completed by Tuesday next. A credible report is in circulation that the Clear Grit will in a few days commence active operations. All arrangements for the starting up of the Hope mine have been completed, powder and all other requisites being now on hand. Robert Walthall, just returned from a trip to neighboring camps, reports a great many more idle men seeking employment than there are here. John Duffy & Co., the lessees of the Speculator mine, are encountering some very fine ore in their recent workings, about five feet in width across the face. James Brogan, foreman of the Elm Orlu, where he has been in practical charge for the last year, has accepted the foremanship of the Original mine. During his superintendency in this camp an accident has never occurred in any of the many mines that have been under his direction, which is as honorable a record as any superintendent can show. A very strong Western smelting company has had a representative in town recently, looking for a suitable location to put up a smelter. The plan in contemplation includes the erection of a large reduction plant. The difficulty of getting iron ore for fluxing is the principal obstruction in the way.

HIGHLAND DISTRICT.—Cor. Butte *Miner*, May 7: I have just returned from the Highland district, about 25 miles distant from Butte. In one dry gulch four men are now taking out dust which averages from \$35 to \$100 per day, and are only using a rocker. There is but little water—not sufficient for sluicing, and it would cost \$100,000 to bring in enough to work the diggings with hydraulic pressure. There are about 12 or 14 new locations made in the quartz locations above the placers. Among them are the prospects owned by E. F. Dunkel, Jere Roach, and W. C. Miller, of Butte. On the lead which has been traced for 600 feet, these gentlemen

have sunk 17 or 18 shafts, and the prospects are wonderful. Only the day before yesterday assays made by Carney and Hand, Max Mayer and Wartenwiler, went \$41, \$13, \$38, \$59 and \$58. Mr. Miller is working the shafts daily with a small force of men. The mineral generally, in this belt of mountains, is composed of quartzite, oxides of iron, galeua, copper staining, gold chlorides and gray sulphures. There are only from 10 to 12 locations made so far in the district, extending not over one mile in length and one-half mile in width.

NEW MEXICO.

KINGSTON.—Cor. Rio Grande *Republican*, May 5: The camp is looking as well as ever, and new properties are joining the ranks of the producers. The Gray Eagle on the South Percha, through the efforts of the present operators, St. Louis people, is developing into a big mine. The Little Nellie group near the Gray Eagle is becoming a first-class property, the ore all being high grade. The Lochiel is producing large quantities of carbonate ore, with the indications for high-grade ore improving as development progresses.

OREGON.

QUARTZ-MILL.—Jacksonville *Times*, May 5: The quartz-mill is again in operation at the Hope mine on Wagner creek, having been bonded by San Francisco parties. Ingram, Baker & Dean, Houston & Co., of Willow Springs precinct, are engaged in cleaning up, with excellent prospects. The loss of Klippel & Daumle's quartz-mill is a serious one to our mining interests, and it is to be hoped that it will be rebuilt at an early date. A ledge five feet wide has been exposed in the Jacksonville Milling and Mining Co.'s tunnel, and it may turn out to be still more extensive. The ore seems to be of an excellent quality, and several tests of it have been made, all of which show the existence of valuable minerals in paying quantities. So great is the body of quartz that even if it pays only \$6 a ton, there is a fortune in it. A correspondent says: Good diggings are being struck on Briggs creek now, Arnett Brothers' claim paying big. Dr. J. T. Ireland, who is working Harry Oviatt's claim, is doing well; also H. Powelson, at the mouth of Onion creek, and Brower & Crockett, at the mouth of Swede gulch, have flattering results. Miners on Galice creek are doing quite well this winter. Excellent prospects, and lots of dirt has been sluiced off. Chinamen on Rich gulch (Ennis & Cameron's claim) are doing well and will make a good cleanup at the end of the season. Walter Simmons surprises himself with a big sack of dust every month or so. Nothing doing in quartz yet; everything quiet.

UTAH.

THE MINES OF BEAVER COUNTY.—Cor. Salt Lake *Tribune*, May 7: Nearly 200 tons of ore will be shipped from here to Salt Lake this week, and are all from Star district, and mostly from the Red Warrior and Mammoth mines; smaller quantities from the Wasco, Stillwater, Rebel and other claims. W. S. Martin has about two carlots of high-grade ore out on the Talisman mine, but will not ship at the present price of lead and silver. This claim is looking well, and the work of development still goes on. The population of Star district has decreased over one-half in the past six months. Most of the old claims are looking well, and ore shipments will continue for some time to come.

PARK NOTES.—*Record*, May 5: As the snow is rapidly disappearing, old-timers are getting up into the hill again to look over their treasure heaps. Among this class is Jim Bowen, who is preparing to make some big developments on his Snake creek property. The Crescent concentrator will be closed down till about the middle of next week, when ore shipments over the tramway will have been resumed. The run made by the concentrator has been most successful, all the old ore supply having been cleaned up. This month's work of the Marsac mill shows a larger and richer bullion product than for any like period before. The record of this mill, working on Daly ore, cannot be surpassed by any mill in this interior country.

REVIEW.—Salt Lake *Tribune*, May 6: For the four months of the present year the receipts of bullion (excluding all ore receipts) in this city have been as follows: January, \$558,148.44; February, \$357,815.23; March, \$425,869.30; April, \$310,632.63; total, \$1,752,485.65. The Ontario output for the four months of the year was as follows: Fine ounces—January, 104,446.49; February, 96,328.29; March, 100,460.80; April, 94,087.87; total, 395,323.45 fine ounces. Ore sales—January, \$60,740.99; February, \$45,718.77; March, \$48,051.92; April, \$49,382.87; total, \$203,895.55 ore sales. An approximate product for the four months of \$599,218. Out of this the regular monthly dividends of 50 cents per share have been paid promptly, making for the four months \$2 a share, or \$300,000. The Daly output for the same four months was as follows: Fine ounces—January, 59,624.19; February, 47,092.62; March, 61,457.12; April, 58,763.00; total, 226,937.94 fine ounces. Ore sales—January, \$17,518.61; February, \$45,065.63; March, \$17,724.66; total, \$39,748.90 ore sales. The bad roads prevented April ore shipments. The above figures give an approximate output for the four months of \$266,685.84. Two dividends, the first of 50 cents per share and the second of 25 cents, have been paid, the first on February 15th, and the second on April 30th. New hoisting works are being put in, and the mine will then be in first-class shape for production. They will be in place toward the latter part of June. The receipts in this city for the week ending May 4th, inclusive, were \$53,900 in ore and \$49,925.81 in bullion, a total of \$103,825.81. For the previous week the receipts were \$116,610.69, of which \$61,618.29 was bullion and \$54,992.40 was ore. The product of the Ontario for the week was 19,040.81 fine ounces of bullion and \$23,363.02 in ore sales, a total of \$43,303.83. The Daly output for the week was 11,079 ounces fine bullion; no ore sales on account of the bad roads. Fine bar receipts for the week were to the value of \$21,798.36; base bullion, \$8357.45. The product of the Hanauer smelter for the week was bullion to the value of \$18,070. The Horn Silver shipped four cars of ore during the week, and was said to have as much more ready to ship.

—IMPROVED—
**James Patent Economic Quartz Mill,
 ROCK BREAKER**
 —AND—
AUTOMATIC ORE FEEDER.

This Machine is now Superior to any, not excepting the Stamp Mill.

DOUBLE and TRIPLE MILLS,
 With Two or Three Rockers in One Mortar.

SINGLE MILL, Shoes drop 1200 per minute.
DOUBLE MILL, 2400. **TRIPLE,** 3600.

PRICES:

Single Mill, \$375. Rock Breaker, \$100. Automatic Ore Feeder, \$25

MILL SUPPLIES AND LUBRICATING OILS.

BROCK'S PATENT DROP FORGED CHAIN PIPE WRENCH

MADE ENTIRELY OF BAR STEEL. Six Sizes; adapted for Pipe from $\frac{3}{4}$ to 14 inches diameter.

Each number will fit a range of sizes equal to six or more pairs of common tongs, while it will outwear an equal number of any kind.

All parts are interchangeable, and can be readily renewed.

Jaws are hardened to a saw temper, and can be sharpened with a file.
 Does not crush pipe; has a quick grip; never slips; chain will not unhitch while in use, but can be instantly released.

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

THE FRISBEE-LUCOP MILL CO.,

Office, 145 Broadway, cor. Liberty St.,

NEW YORK,

HOOKER & LAWRENCE, Gen'l Agents.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains 94 per cent of Nitro-Glycerine, and **GELATINE-DYNAMITE,** Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

CHAS. & WM. MONTGOMERY, Props.

Sectional View of Pulverizer.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

Pacific Coast Coals.

Owing to the light demand for tonnages at the port of San Francisco, fewer cargoes of coal than usual have come here from foreign sources, with the result of stimulating production at the coast collieries. Washington Territory sends us the most coal and Oregon follows.

The California mines produce comparatively little. The Mount Diablo coal is mainly used for steam purposes, and the Ions coalfields, Amador county, furnish enough for the local railroad division and domestic consumption in the region where produced. Of course, large quantities come from British Columbia also, as well as from England and Australia.

A new steel steamer is shortly to be built for the Southern California coal trade. She will ply between Port Moody, B. C., and San Pedro, Ballona and San Diego. At the latter places bunkers will be put up. The coal trade of Southern California has increased enormously of late. And this, notwithstanding the fact that crude petroleum has supplanted coal in all manufactures and steam-making around Los Angeles.

The new mines in Oregon are turning out fine coal.

The Oregon Improvement Co.'s coal business this year has greatly increased. The company is now fairly well at work on the new Franklin mine, 33 miles from Seattle, on the Columbia & Puget Sound railroad. Its development has been slow, owing to complications with the Northern Pacific over the lands near which the mine is located. The company is now taking out 170 tons a day, and cannot supply the demand. This is the finest coal ever found on the Pacific Coast. Thorough tests at iron works demonstrated its superiority to Wallsend (Sydney) coal, which is classed as a first-rate coal all over the world. The company is now a large dealer in foreign coals in San Francisco and Portland. Ocean freights to San Francisco are advancing, and the prices of foreign coals have been increased in proportion.

It seems to be a pretty well-settled fact that the Texas, Santa Fe & Northern railroad, the narrow-gauge line running into Santa Fe, New Mexico, from Espanola, and connecting at that point with the Denver & Rio Grande, has been obtained by the latter line. There is now no doubt that the narrow gauge will be extended south from Santa Fe to Corralitos, and there tap the richest coal beds in New Mexico.

R. M. Stevenson, of Bozeman, M. T., is in the city. Mr. Stevenson says that the coal in the vicinity of Bozeman is improving in development, and a railroad is being built so as to place it within reach of the great smelters of Butte and Anaconda.

Electricity in Working Ores.

We have several times of late mentioned the work being done at the Douglass mill, Dayton, Nev., with Dr. Rae's "electric process" of

crease in the cost of chemicals for a silver-mill is twice the cost of treatment and power when this new process is used. In the Douglass mill it has cut down the cost of chemicals one-half, and does better work. The main feature is in the reduction of loss of mercury. It has been tried for a couple of months in the Douglass mill, and is said last month to have effected a saving of some \$5000 over the ordinary methods.

Dr. Rae has just made his arrangements in the East for wire, and will soon be ready to

City Refuse and the Bay.

The city authorities of San Francisco are considering the best means of disposing of the city's garbage and refuse without throwing it in the bay as has heretofore been done. It is about time that this question was brought up. The city people have been opposed to the miners several hundred miles away dumping debris in the rivers which would carry it to the bay and shoal it; and at the same time have been dumping city debris into the bay themselves by the

thousands of tons. The city sewers empty their refuse into the bay along the city front, shoaling and filling up the slips between the wharves. Dredgers and steam tugs work all the year round digging the stuff up and carrying it out into the middle of the bay where it is dumped, letting Providence and the tides do the work of ultimate removal. Providence has its hands full looking out for the city itself, and the tides work both ways—in and out. The result is the material from the dumps, the sewage deposits, and the city front mud, thrown into the bay night and day for years, are damaging the harbor.

A new shoal has formed, running from Alcatraz to

Fort Point, and some day a deep ship will bring up on this, and the whole thing will be laid to the miners, who will be made the scape-goats of the city's carelessness.

The whole matter of the disposal of the city's refuse is an engineering proposition. With intercepting sewers to carry the loads of other sewers down to the Golden Gate, and empty the material only on ebb tide, the Pacific ocean could be made the dumping-place. The removal of the garbage and rubbish could be accomplished by scows and tug boats which would take it to the ocean, and not the bay itself. The city front mud should also be carried further away. In some large cities in this country and abroad, the city refuse is burned in furnaces especially adapted to the purpose. We described such a furnace in a recent issue of the PRESS. To be consistent, our city fathers should cease permitting the city refuse to pass into the bay, since they are doing themselves precisely what they condemn others for doing.

J. J. KERMEEN, who has had charge of the Ruby and Dunderberg mine at Eureka, Nev., for several years, has gone to take a position with the La Plata Company, at Leadville, Colorado,

PROCESS FOR WORKING ORES BY THE RAE ELECTRIC SYSTEM.

working ores and tailings. It was at first tried on tailings with a view of recovering the mercury which had been lost. But it has been found even more efficient in working ores by preventing loss of mercury and amalgam.

The engraving on this page shows the appliances used at the Douglass mill. The dynamo is run in the ordinary way by the mill-engine, and the wires are led to the wooden pan in which the ore is worked. One electrical current is applied through the ring anodes and the other current is applied at the bottom. The solution used overcomes the resistance to the electric current. The ring at the bottom is a perforated gaspipe through which passes a sufficient current of water to clean and wash off the lighter particles. Any quicksilver or silver which may float over is caught in the channel or trough encircling the pan, as it overflows. In drawing off the settlers they have only clean material to deal with. For successful work the volt and ampere force have to be carefully adjusted.

The dynamos in use at the Douglass mill are capable of operating seven settlers. Two new ones are being built for this mill to give the full capacity of 16 settlers. The mill works 135 tons of ore per day. It is stated that the de-

contract for the necessary appliances. The plant will be furnished on a royalty or number of tons of ore crushed, the appliances, however, to be purchased. The mechanism is made in this city by the Pacific Iron Works and California Electrical Co.

This process is not new, but the system has just been completed and made successful. Dr. Rae obtained two patents in 1867, one in 1868, one in 1869, and another in 1872, besides the recent patents. The success is really the result of a series of failures which yielded nothing but experience. The recent trials, however, satisfy the inventor and the others interested that the process is now perfect. The English and colonial patents on this electric system of metallurgy have been sold to an English company, and the Mexican territory has also been sold. In a short time the process will be introduced in other mills.

The opening of inexhaustible beds of bituminous paving rock, near San Luis Obispo, is creating a sensation. Contracts have been made for a supply to a Los Angeles company for many thousand tons, the entire work aggregating over \$300,000. It will give work to hundreds of men at San Luis Obispo.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Extraction of Gold.

EDITORS PRESS:—I read with much interest the article of Mr. E. T. Barher, on "The Extraction of Gold," in your valuable paper of March 5th, and his description of the Russell furnace. Having had some experience with refractory gold ores, I will offer a suggestion to your readers that I think will be found an improvement on Mr. Barber's method.

It is this: When ore is put into pans, instead of using quicksilver in pan, use amalgam which is ready to retort and put quicksilver in settler. The amount of amalgam must be varied in accordance with richness of ore, which can be determined in a few charges, but it will be found the amalgam ground with the charge will permeate every part and take up the fine gold, and the amalgam is easily recovered in the settler. I believe this would be an improvement for many free gold ores, when a considerable per cent of the gold is too fine to be caught on the plates. If carefully conducted, I believe 95 per cent of the free gold will be saved. The process is not new, having been used in Old Mexico for a long time, and was described in a paper read before the "Institute of Mining Engineers," of N. Y., in the fall of '85, by C. A. Stetefeldt, M. E.

As I helped make the experiments he referred to, and saw the results, I have great faith in the process. E. C. QUINLEY.

Occurrence of Gold.

NUMBER I.

[Translated for the Press from *El Minero Mexicano*.

The auriferous alluvions of California present different features, according to the valleys where they are observed or the heights where they are found located. The differences are sufficiently pronounced, since Dr. John B. Trask has referred these alluvions to distinct epochs in a report which he made in 1856 to the Government of the United States concerning the exploitation and situation of the gold mines of California. This geologist considers one class more ancient than certain tertiary lands in Vermont described by Professor Hitchcock, the other as nearly contemporaneous with these lands. It may be that the variations indicated by Dr. Trask correspond with little difference in age to the phenomena of the terraces which the ancient alluvion lands exhibit in France in the valleys of the Pyrenees. These terraces present among themselves a relative antiquity, but they correspond to a singular phenomenon which has had successive phases characteristic of the diluvial epoch. This shows that the existence of alluvions in different epochs are not always variant, since we have two examples in Auvergne. Observation seems to indicate that the same happens in California, as there the volcanic fragments which are frequently found in the auriferous alluvions are never found on the surface, which effectively denotes two distinct alluvial epochs. The one made at the expense of the lands that contain the veins of gold should be anterior to the volcanic rocks which jut out in the valley of the Sacramento; the other should be posterior to the eruption of these rocks. The separation of

These Two Alluvial Epochs

Is very noticeable in Minnesota, in the opinion of Dr. Trask, expressed in the report upon the geology of the coast and a part of the Sierra Nevada, submitted to the Assembly at the session of 1854. The alluvion land there reveals considerable thickness. The remains of rocks and volcanic tufas cover the surface, and form a stratum of great strength, under which is found a stratum of sand 600 feet thick, of a different nature and of fragments of rocks without the least appearance of gold. The imperfect argillites form the third descending stratum, establishing the separation of the ancient and modern alluvions. A fourth stratum, of transport rocks 35 feet thick, follows the clays; this is composed of sand and pebbles of hyaline quartz. A particular circumstance in connection with this stratum is, that it contains a great quantity of silicated wood, between which, Dr. Trask notes, the existence of points in a siliceous state. Subordinate to these strata the alluvial portion is found. Although it is not exploited in exactly the same scarp, one could not fail, says Dr. Trask, to recognize the identity. This is proved by the persistence of the same silicified wood as abundant in the gold lavages of Minnesota as on the summit of the mountains.

These Alluvions

Rest upon rocks of granite and porphyry. Dr. Trask points out an interesting relation between the nature of the alluvions and the soil of the valleys in which they are fixed. In Minnesota the sand which accompanies the mud is siliceous, and the pebbles of quartz are numerous; the gold is, moreover, alloyed with a small proportion of silver; the lentejuelas or spangles of gold have likewise a certain thickness. In the northern valleys the sand is mingled with many angular fragments of slate and of serpentine. The gold, of a whitish

color, is alloyed with a greater proportion of silver—in fact, the lentejuelas are always small and the pepitas very rare. The gold lavages of the northern valleys contain, moreover, a large quantity of fragments of arsenical iron, and an assay of this mineral has shown that it is very rich in gold. The

Differences

That we have pointed out between the nature of the auriferous alluvions of California not only make known that gold exists in different lands, but that the veins of this metal which pertain to these lands do not present the same conditions of age and of formation. The deposition of gold in California, so noteworthy for the richness and abundance of the filones, will be of particular interest to science.

The Auriferous Veins

Are produced in two distinct conditions. The greater number form the filones, very clean, with proportional strength or thickness, and a quartzose matrix always similar. The others constitute veins more or less numerous, ramifying between themselves. Each one of them, considered separately, is in reality a filon, but irregular. The irregularity disappears on examining the dispersion of the metal in the split or hurstled rocks, when it will be seen that this group of veins forms by its union a true filon. It is very difficult to give absolute reasons concerning the relative age of these two classes of auriferous veins. However, Dr. Trask has distinguished them by the names "ancient" and "modern." The veins of the first category form three distinct parallel bands, located upon the western part of the Sierra Nevada, including in their union an extent of 11 miles. The first, the most eastern, is distant from the second at least four miles and is found in the same chain. The filones which pertain to these two first zones penetrate the granite, the porphyrys and the serpentines which compose the mountains of the Sierra Nevada, and are prolonged in the most ancient trap rocks. These ancient filones are regular and uniform to a considerable extent. The quartzose gangue constantly preserves the same aspect; the gold is there disseminated by nests and sometimes forms small masses or plates. The matrix, closely adherent to the rocks, is brittle, is separated with difficulty, and occasionally breaks when penetrated. They are frequently decomposed. The exploited filones, above all those noted for their opulence, belong to the most ancient group; they are situated principally in the counties of El Dorado, Placer, Nevada, and in a part of the county of Yuba, at a short distance from Scott's Ferry. In this last county, filones, which belong to the modern or recent group, have been examined; these cut and disorder the first, a disposition which establishes their posteriority.

The filones which belong to the third zone appear according to all their distinctive marks, and notably with relation to their parallelism, to be of the same epoch as the first, but farther from the principal chain, the lands which they cross being very different. The rocks here dominant are the talcose slates. The filones cut the strata in a distinct manner, but an arrangement is always observable, that makes a remarkable difference when the filones are attentively considered; it is, that this variation of the slates extends to a distance much greater than that of the filones which pass through the granite. The quartz, which serves as a matrix to the gold, is, moreover, infiltrated in the clefts and in the strata of the slate in the form of indurated, tangled thread. The result is, that at the first impression, one recognizes less easily the origin of these filones, and determines with difficulty their thickness; but when they are observed for a certain length, a mile, for example, their regularity is confirmed, and one is then sure that they depend on the group of ancient filones. The last observation made by Dr. Trask, which it is necessary to point out, is, that these filones never extend into the tertiary lands, that have not decomposed them, and which are consequently of an anterior formation to said lands.

The filones of the second group are distinguished by a regularity less pronounced than those which characterize the more ancient filones. They are often divided into small branches, in which the potency or thickness is lessened to one inch. They do not always compose that form designated stock-work, by which the massed ore is worked in chambers or stories. The branches into which the filones of the second group are divided, affect by their conjunction the direction which characterizes them. This is, properly speaking, a band of intruded rock enriched the length of the walls of the filones by a dispersion of auriferous quartz; but these veins are, so to say, perceived by multiples for some lengths; such a one is that which has been exploited near Centerville, in Placer county, which includes in a direction north and south more than a mile and a half. It crosses successively the granite, the lustrous blue talcose slates, and the trap rocks. Finally, that which fixes its modern age, is, that it cuts and separates a vast filon belonging to the first group.

(To be Continued.)

WE notice that the artist of *Puck* has recognized the merits of the Rand drills, by placing one of them in the hand of the President for political road-making in their leading cartoon of the last issue.—*Salt Lake Tribune*.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WAGON-REACH.—A. Singer, Lovelock, Nev. No. 362,231. Dated May 3, 1887. This wagon-reach consists of the double-jointed or hinged reach, the object of which is to avoid strain on the reach and allow for the motions of the wagon in passing over uneven ground. The reach adjusts itself to all the movements of the wagon.

DRESS CUTTING CHART.—Thos. Hswkins, S. F. No. 362,378. Dated May 3, 1887. This dressmaker's chart consists of a series of forms with measures and figures for outlining the different parts of the garment and obtaining the correct sizes, and the combination or condensation of these forms upon one or two sheets so as to simplify the work and reduce the number of charts necessary.

EMBROIDERY FRAME.—Charles Schaubel, S. F. No. 362,230. Dated May 3, 1887. This invention relates to that class of frames specially adapted for holding under tension and in proper position material for receiving embroidery work, painting or repairs, or additions of various character; and the invention consists in the peculiar and novel means for readily tightening and holding under tension the material to be worked upon. The means for tightening can readily be applied and the material cannot be injured.

VISE.—Edward H. Farmer, Gilroy, No. 362,262. Dated May 3, 1887. The invention consists, in combination with the vise jaws, one of which has a slotted back, of a bolt pivoted within said back, whereby it may be extended for use in securing the vise or dropped down out of the way, and a nut on said bolt. The object is to provide a vise which may be readily connected with any convenient support; if in a workshop with a bench or framework, or if in the field with any suitable portion of any larger implement, as the wheels thereof, so as to furnish for the vise a firm support.

CAR-WHEEL.—Wm. H. Masterman, S. F. No. 362,292. Dated May 3, 1887. The invention relates to an improvement in car-wheels and axles for the purpose of relieving the friction and strain which occur where both wheels are rigidly secured to the opposite ends of a single axle for railway cars. It consists in forming a journal upon one end of the axle separate from and independent of the journal which turns in the boxes, and in fitting one wheel to this supplemental journal so that it may turn slightly in passing curves or other points where necessary.

SULKY CULTIVATOR.—Ira B. Kilgore, S. F. No. 362,286. Dated May 3, 1887. The entire tooth-carrying frame is of simple construction and the main bars are all of gaspipe. The cultivator teeth are all in front of the driver's seat. The teeth are easily raised to the desired height and kept at any distance required. By operating a lever, the wheels may at once be turned to an angle with the previous line of travel, thereby throwing the tooth-carrying frame around, and this movement will enable the machine not only to turn the corners, but also to turn temporarily out of the way of any projection or obstruction on the line of travel.

BOOK SUPPORT.—Peter O. Peterson, S. F. No. 362,226. Dated May 3, 1887. This invention relates to that class of furniture attachments in which a flat piece or table-top is attached to the end of a swinging bracket, and is so mounted that it may be brought within reach of the operator, and may be used when flat as a table, or may be turned to any desired inclination, and there be held so that it may serve as a writing desk, or with the assistance of an adjustable strip at its base may serve as a reading stand. This invention consists mainly in the supporting frame to which the top is hinged, and upon which it rests, and the pivot connection of said supporting frame with the main swinging bracket.

RAISIN-STEMMER.—James Porteous, Fresno, No. 362,228. Dated May 3, 1887. The invention consists in an outer-fixed open-ended truncated cone, arranged in a perpendicular position, a fixed hopper in communication with the upper end of said cone, a rotating inner cone perpendicularly arranged, the apex of said cone extending into the hopper, and its body working within the outer cone, said inner-rotating cone having a diameter enough less than the diameter of the outer-fixed cone to leave an annular space for the passage of the raisins. The invention further consists in the adjustability of the inner-rotating cone, whereby the capacity of the raisin passage is varied, the means for accomplishing this adjustment while the cone is in motion, the peculiarities of the raisin passage between the two, and certain details of construction.

VINEYARD WEED-CUTTER.—James Porteous, Fresno, No. 362,227. Dated May 3, 1887. This is one of that class of agricultural implements which are employed for cutting weeds and which have a flattened V-shaped blade or knife, adapted to travel under the surface of the ground, thereby cutting off the weeds.

The object is to provide an implement which, by reason of its peculiar general construction, is well adapted for use in vineyards, where the low overhanging and spreading tendrils and other vegetation of the vines prevent any ordinary cultivator or weed-cutter from working close to the stems or stocks of the vines and eradicating the weeds. The invention consists in an implement, the entire framework of which is narrowed down to a minimum, and carrying a V-shaped blade or knife, the wings of which project far enough on each side of the narrow framework to reach under the vines and near to the stems or stocks, the framework, by reason of its construction and position, avoiding the tops.

BALANCED PULLEY FOR CABLE RAILWAYS.—Warren Dunham, Igo, Shasta Co. No. 362,258. Dated May 3, 1887. This invention consists in a peculiarly constructed cable-supporting pulley, the object of which is to prevent accidents by reason of the traveling grip coming in contact therewith. In cable railways the traveling cable from which the car, through its grip attachment, derives its motion, is supported within its tube upon pulleys from which the grip raises the cable as it passes, and thus avoids interference. These pulleys are usually fixed in position, and it will be readily seen that if the grip should come in contact with one of them, there would be serious injury; but by making the pulley yield to the grip and return to position after it has passed, there can be no accident of this character. Mr. Dunham's "accommodating" pulley is of peculiar construction, and has curved guard-rims or flanges.

CONDUCTOR'S TIME OR TRANSFER PUNCH.—Solomon Adler, S. F. No. 362,240. Dated May 3, 1887. This is one of that class of punches to be used by car-conductors to indicate upon a ticket a fact or series of facts, the knowledge of which is important. The object is to provide for the proper issuance and use of what are known as transfer tickets. These are issued at points of transfer by the conductor, and usually under the conditions that they are good only at that point and for that trip; but these conditions are not observed by the traveling public, and their use is by no means confined to the continuous trip for which they are issued. The abuse of the tickets by the public naturally leads to abuse by the conductors in their issuance, and as a consequence it not unfrequently happens that the tickets are used as currency in a great many shops and places. This new punch will avoid these abuses, since it will indicate upon the transfer ticket itself the exact time when it is issued, or the time up to which it is good when used, in connection with a rule of the company, limiting the use of the ticket to a certain number of minutes or other specified short time after its issuance, or up to the time indicated.

WHEELS FOR WATER-POWER.—L. A. Pelton, while upon the Comstock, says the Nevada Transcript, made arrangements introducing his hurdy-gurdy water wheels into use at the Con. California and Virginia mine for purposes of hoisting and milling, in place of the steam-power now in use. The latter is quite expensive, wood costing at that place \$15 a cord and engineers' wages being very high. To furnish the power for the machinery, four of the Pelton wheels, each 11 feet in diameter, and weighing about 4500 pounds, will be used. The shaft is 2000 feet deep. One of the wheels will be placed at its surface, a second at a depth of 500 feet, a third at a depth of 1500 feet, and a fourth at the bottom of the shaft, or 2000 feet below the surface. The water which propels the surface wheel will have a fall of 500 feet, then pass on down from one wheel to the other, and after doing service for the lowest, pass off through the Sutor tunnel. From three to four million gallons of water will thus be used each day. The power will be transmitted from one wheel to another by a series of wire rope belts. Each wheel has a capacity of 250-horse power, and the connections will give the surface wheel, to the shaft of which the machinery is attached, 1000-horse power. The wheels that go into the shaft will be made in two parts each, and will be put together at the stations where they are to be located.

GOLD IN NEVADA.—For many years the gold mines in Hawthorne district were neglected because the appearance of the ground was not that in which experienced miners were accustomed to find gold. During all that time, and since, Garfield has been regarded as a district in which no gold could be found. It was taken for granted that the district was exclusively silver producing, and no search was ever made for gold. Recently in the Iron Horse a ledge, carrying a fair percentage of gold, has been discovered, and in the ore taken from the Honest John there are several dollars in gold to each ton. May it not be possible that the usual order will be reversed in those mountains, that is, that the silver ledges may change into gold ledges? At least it will not be surprising to learn that some lucky prospector has found a gold ledge in Garfield, and if such is found and it is fit company for the silver bearers, the owners will need a mint on the ground. Gold is where it is found and there is no telling what might happen if some prospector would go over Garfield with a mortar and pan.—*Walker Lake Bulletin*.

ORDERS have been received at Vallejo to commence work on the Hartford.

Pacific Grove Retreat.

The burning of Hotel del Monte, which has been widely heralded, has awakened public interest in the steps to be taken for the restoration of the attractions the fame of which has become world-wide. We understand that work is rapidly progressing which will, in a few months, result in a new and much improved Del Monte. The immediate effect of the loss of the great hotel is to call out into more prominence the twin attraction of Monterey, the Pacific Grove Retreat. Our readers have seen frequent allusions to this seaside beauty-spot, as the seat of the California branch of the great Chautauqua University, and as the gathering place of leading religious assemblies. Fortunately before the Del Monte fire there was approaching completion a new hotel at Pacific Grove which now comes forward to serve those who desire to resort to the environs of Monterey during the present summer. Our engraving on this page presents, in a very acceptable manner, the beauties in and around Pacific Grove as they now appear, including recent improvements, and therefore superseding previous sketches.

On a promontory one mile west of Monterey, covered with pines and clumps of oak that would gladden a Druid's eye, is located the now famous Pacific Grove Retreat, the Seaside Camp-ground and Christian Seaside Resort. The encampment commands a magnificent view

and popular place of resort. Mr. Schonewald will make every provision for the entertainment of those who seek its hospitality, and the tanks at "Del Monte" will be placed at their disposal, together with the clubhouse and stable. The opening of the El Carmelo at this time is most opportune.

This picture shows that Pacific Grove is quite like a metropolis with its superb hotel, bathing pavilion, streets, avenues and houses. So far as nature has a chance, this place is now in its gayest attire. The bay, the beach, the bathing, are all fine; the trees are in full leaf, the grass is soft and green, wild and cultivated flowers are in profusion, the music of the mocking-bird and linnet greets the ear in all directions, made more melodious by the haritone of the ocean's waves. "See Naples and die." We had rather pass a few days at Pacific Grove and live.

GOLD IN MONTEREY COUNTY.—A report has been brought to San Luis Obispo of the discovery of gold in the mountains bordering on the coast in Monterey county, just north of the San Luis Obispo county line, the immediate location being the San Carpojoro rancho, which is reached by travel only from this county. The find is a short distance east of what are known as the anthracite coalfields of Monterey county, and is in township 24 south, range 7 east. The gold discovery was made by an old-timer named Cruikshank, who, while working

The New Ore Rates.

Salt Lake amelter men and local miners interested in Idaho and Montana mines are looking with careful countenances at the Union Pacific's new tariff sheet, giving the following rates on silver-lead ores:

From Shoshone, Huntington and intermediate points on the Wood River branch north of Shoshone, to and including Ketchum, to Kansas City, \$21; Omaha and Council Bluffs, \$20; Denver, \$17; Ogden and Salt Lake City, \$15.

From all points in Idaho and Montana on the Utah & Northern Railway, all points on the Montana Union Railway and points on the Northern Pacific Railway, between Garrison and Helena, inclusive, to Kansas City, \$13; Omaha and Council Bluffs, \$12; Denver, \$10.60; Ogden and Salt Lake City, \$8.60.

From Park City to Kansas City, \$11; Omaha and Council Bluffs, \$10; Denver, \$7; Ogden and Salt Lake City, \$4.

From all stations on the Salt Lake & Western Railway to Franklyn, Germania, Sandy and Salt Lake City, \$4; Denver, \$10.60; Kansas City, \$14.40; Omaha and Council Bluffs, \$12.40.

It is argued, if this is not discrimination against Salt Lake City, what is it? For \$2 per ton, ore is carried nearly 700 miles, in order to favor the Denver smelters, while from Ketchum Shoshone points to this city, 250 to 300 miles, \$15 per ton is charged. A mining

Comstock Bullion Product.

The Assessor's official statement of the bullion product of the mines in Storey county Nev., during the quarter ended March 31st, is as follows:

Consolidated California and Virginia—Ore extracted, 34,206 tons; value per ton, \$22.40; gross bullion yield, \$766,063.98; cost of production, \$463,015.67.

Savage—Ore extracted, 259 tons; value per ton, \$18.54; gross bullion yield, \$47,829.18; cost of production, \$45,620.70.

Halo and Norcross—Ore extracted, 245 tons; value per ton, \$12.48; gross yield, \$3057.78; total cost of production, \$3231.23.

Crown Point—Ore extracted, 6781 tons, value per ton, \$8.35; gross yield, \$53,471.72.

Kentuck—Ore extracted, 1408 tons; value per ton, \$15.13; gross yield, \$21,297.30; total cost of production, \$21,125.90.

Yellow Jacket—Ore extracted, 14,725 tons; value per ton, \$9.55; gross yield, \$140,670.57; total cost of production, \$201,382.59.

Overman—Ore extracted, 1945 tons; value per ton, \$8.58; gross yield, \$16,680.61; total cost of production, \$17,828.56.

Belcher—Ore extracted, 6781 tons; value per ton, \$8.35; gross yield, \$56,615.59; total cost of production, \$53,471.72.

COAL AT VERDI.—County Commissioner Merrill, of Verdi, informs a Reno Gazette reporter

of the bay of Monterey and the variegated scenery that environs it. The general arrangements of this watering-place are based upon the principles guiding those of the Eastern States, especially the one held at Ocean Grove, in the vicinity of Long Branch, N. J. History is full of surprises. One mile from the spot where Father Junipero Serra, the best-known and noblest of the Franciscan missionaries, landed and took possession of the country in the name of the King of Spain, chanting the Te Deum and scattering holy water, a new race and people have come, with quite another shape of religion, and made the place notable for rest, health, prayer-meeting, missionary and Sunday-school conventions.

The quiet of this sylvan retreat has recently been broken by the land boom. The voice of the huyer is heard in the grove. The fever for eligible sites has invaded the calm and shady retreat. The great number of visitors during the summer of 1886 was the first decided thrill of prosperity that determined what this place shall be, and from month to month has witnessed new and cozy homes in all portions of this beautiful spot. Avenues and streets are being constantly opened and improved by the Pacific Improvement Company, and also by private individuals.

El Carmelo is the name of the hotel lately erected by the Improvement Company at Pacific Grove, and which has already been opened under the management of George Schonewald. It is a thoroughly complete building in all its interior arrangements, and will have elegant accommodations for upward of 200 guests. It will be kept in splendid style, and no pains or expense will be spared to render it a pleasant

in the hills, struck a lead of quartz, and, following up his luck, found the quartz to be rich with the precious metal and containing considerable free gold. Cruikshank, on the day following, communicated the matter to Captain Thorndyke, the lighthouse keeper at San Simeon, who obtained the services of a mining expert named Todd Smith, and repaired to the San Carpojoro rancho. Some quartz was pounded out in a rude hand mortar, and a small quantity of it gave about \$50 worth of gold. The ore is the richest the miners have ever seen, and the men have already formed a company. Last Saturday the reports reached San Simeon, and Sunday morning saw an exodus of men and boys, all eagerly traveling toward the goldfields on foot and by saddle horses. It is proposed to bring the ore down from the Cruikshank mines by pack mules to San Simeon, where it may be shipped to San Francisco. Great excitement prevails in the northwestern portion of the county over the speculative reports. The region where the mine is located contains but few habitations and is on Government land.

At the Anaconda copper smelters, Montana, labor-saving machinery has been introduced and the effectiveness of the works increased in many ways, while the cost of operation has really been lessened. The works are now in the best possible condition to meet the most active and bitter competition. There is also a well-founded report that the percentage of silver in the Anaconda ore increases with the depth. Altogether the Anaconda works are now in a favorable position to meet the attacks of competition.

man, speaking of this yesterday, said that if this city had half the business energy of Denver, such an inequality would not be tolerated. Salt Lake City ought to build a narrow-gauge road on its own account to the Wood River region; then ore could be brought in for what it should be—\$6 per ton. Then the idea of carrying ore from Montana to Denver, with re-shipment at Ogden, for \$7, \$8 less than from points on the Short Line and 100 miles' further haul. Of course, by doing this, bullion for the Omaha refineries is shipped from Denver over the U. P. road. It is prophesied that when political power is stripped from the church something effectual can and will be done to change this state of things.—Salt Lake Tribune.

MESSERS. R. P. McCORMICK & Co., of Kansas City, Mo., contractors for the double-track railroad tunnel, at Kansas City, Mo., 1000 feet long, have placed their order with the Ingersoll Rock Drill Co., of New York City, for a complete plant of tunneling machinery, comprising one Straight Line air compressor, one air receiver, seven Ingersoll tunneling drills, with columns, mountings, boilers, etc. Messrs. McCormick & Co.'s contract requires the completion of the tunnel within 90 days.

EASIER THAN DIGGING.—A dispatch from Tucson, A. T., dated the 9th, says: A party that has just returned from the Santa Catalina mountains report that a good effect of the earthquake is the opening of two large gold veins which were discovered in Santa Catalina mountains at the point where the whole side of the mountain slid down. Several prospecting parties have left here to locate water and claims.

that it is highly probable the coal discovered there several years ago will be prospected by a company of capitalists during the coming month. Two layers or beds of the coal crop out of an embankment of the Truckee river about three-quarters of a mile west of the town. Some work was being done on the "find" when a Mr. Martin bonded that and adjoining properties for three years. The properties thus bonded cover an area of probably 2000 acres, and the sum for which the bond calls is about \$45,000. The coal is said to be of good quality, especially for the manufacture of gas. What its character may ultimately prove can only be determined by development work.

EFFECT OF THE INTERSTATE LAW.—Mr. Williams, superintendent of the Copper Queen Smelting Works, says that he will buy his coke either in England and ship via Cape Horn to Guaymas, or in Tennessee and ship to New Orleans and thence to Guaymas, and in bond to Arizona, as he cannot afford to ship the coke by rail from any distant point in the north or east to Arizona, owing to the effect of the Interstate Commerce law on long and short haul. Mr. Williams also says he will ship his bullion to Nogales, and thence in bond through Mexico to England, to evade the Interstate law, instead of as heretofore by New York.

A DISPATCH FROM VICTORIA, B. C., dated May 9th, says: The steamer Woodside arrived from the west coast yesterday, having on board a number of Chinese miners from Bear river, which empties into Nookta sound. They brought between \$25,000 and \$30,000 in gold dust.

Passing Events.

The latest gold excitement in this State is in the southwestern part of Monterey county, not far from the San Luis Obispo line. Nearly all the people of Cambria have gone there to locate claims. Samples of ore are said to be rich, and there is quite a rush to the new district. If good quartz mines are found there they will be nearer the coast than any so far found in the State.

The proposed new water-mills on the Comstock, when at work, are expected to greatly reduce the cost of working ore, thereby helping out the low-grade mines.

Petroleum is now being very largely used as fuel in this State, especially in Southern California, where most of the steam users are applying it. A number of institutions in this city are also now using this liquid fuel.

The oilfields of California are becoming more important every year. This season there is considerable prospecting being done, and at a number of places boring is going on.

A very important event for this State was the laying of the corner-stone of the Leland Stanford Jr. University, on Saturday last. This institution is destined to be of great benefit to the educational interests not only of California, but the United States.

Beginning to Yield its Fruits!

The so-called Alien Act, the leading provisions of which, with some comments thereon, were published in a late issue of the PRESS, appears to be yielding its bitter and unpalatable fruits sooner and more abundantly even than was expected. From every quarter we hear steadily increasing complaints of its operations, save only from those outside countries which, instead of being hurt, are likely to be greatly helped by such operations. Being confined to the Territories, it was thought at first that this law would have the effect to promote the sale of mines situated in California and other of the mining States, in which view the owners of this class of properties were beginning to congratulate themselves on the advantages that would thence accrue to them. But in this they are likely to be disappointed. Foreign investors are not only disgusted at this sort of legislation, but it awakens in them a feeling of distrust as to the future. If they are to be excluded from investing in the Territories, why may they not be from the States as well? If Congress, through inattention and haste, as in this case, may pass, or suffer to be passed, a law so manifestly impolitic and uncalled for, why may they not in like manner pass others equally wanton and absurd? So reasons the intelligent foreigner, and, fearing for the security of his investments here, naturally seeks a country where they will not be exposed to being so endangered or tampered with.

But even were it otherwise, were the effects of this law favorable to California, she has no desire to profit at the expense of her neighbors. Our miners are not in so great need of financial aid from abroad as are those resident or owning mines in the Territories. With us this industry is further advanced; we have more home capital. Our mines, as a general thing, are more easily opened and equipped than is the case in these newer countries; wherefore, the mining interest here will not sniffer so much from this shutting out of foreign capital as will that of Arizona, Utah, Idaho and Montana. In these Territories, negotiations, before pending for the sale of mines abroad, have been abandoned, with little chance of their ever being renewed. These sales, had they been consummated, would have involved the expenditure of many millions, all of which will now be lost to these countries.

Meantime, Mexico, South America, India, Africa and other distant regions are reaping the benefit of our insane legislation, a great impetus having, since this Act took effect, been there imparted to the business of mining. Parties from Mexico tell us that a greater influx of English capital, owing to this cause, is already noticeable throughout all the northern and northwestern States of that republic. That the late dispatch by the English of so many mining expeditions to South Africa has been due in part to the rebuff they have met with here, may reasonably be supposed.

By one of the provisions of this Act, if ever it should so happen that more than one-fifth of the shares of any mining company shall come to be owned by foreigners, the mines of the company, if situated in any of the Territories, are forfeited to the United States. Was there ever a thing more preposterous than that? This is equivalent to preventing such company from selling their stock at all, since if they venture to do so they cannot by any possibility guard against its falling into the hands of these dangerous people. What better plan for imperiling the property of a mining company seeking to sell its shares could have been devised than this? Certainly no company terrorized by this law could feel safe in allowing more than 20 per cent of its capital stock to pass beyond its control. Should they do so, and the excess come into the possession of the barbarians, then would it become the duty of the public prosecutor to bring suit against the company and have their property confiscated by the General Government. Could fatuity further go than this? It would not surprise us were there to be some inquiry as to the votes by which this extraordinary bill was enacted into a law.

THE closing of the furnaces on account of the coke strike is producing alarm among the rail and Bessemer mills west of the Allegheny mountains, and a great number will be compelled to seek relief in purchasing foreign pig iron.

Resources Held in Reserve.

The rapid advancement of California in population, wealth and improvements, must ultimately lead to a more extensive use of that large class of her natural products which have thus far been but little utilized or remain wholly neglected. As the cultivation of the land inaugurated a second epoch in the industrial history of the State, so will the business of developing these now neglected products constitute another such epoch when the time shall have arrived for its active prosecution. At first the leading, and almost only pursuit here, was mining, little or no attention having been paid to agriculture in any of its branches. Gradually it began to dawn upon our people that the soil and climate of California were adapted to the growth of wheat and the other cereals, also fruits of various kinds. Timidly they engaged in the business of grain-growing, vine and tree-planting, horticulture, etc. From that day to this their experience has been a series of revelations, each one disclosing some new productive capability for the soil and the climate. Fruits that it was thought could be raised only in intertropical countries grow and mature here with little care. Lands that were at one time considered worthless turn out to be exceedingly valuable, there being in this State no such thing as absolute sterility where water can be had for irrigation. Surveying the present status of agriculture, all are surprised at the changed conditions and view that the passing years have brought with them.

Even so will it be, we predict, when, some few years hence, these other resources, now so little heeded, shall come to be looked after and turned to practical account. Little by little we shall enter upon the task of seeking for and appropriating them to our use. Now it will be granite, marble and other descriptions of building stone; then cement, salt, asbestos and mica; next, perhaps, pitch, rosin and turpentine, arresting their importation from North Carolina. In good time, the now dead iron industry will be reencited and extended. No Californian can feel quite right till he sees again the fires aglow in the furnaces at Hotelling. The business of mining for coal, manganese, antimony, chromium and graphite, now struggling, some of them nearly extinct, will undergo more or less expansion. The output of petroleum, asphaltum, lead, copper, borax and quicksilver will be enlarged. By-and-by we will get to quarrying and dressing our fissile slates—make larger use of our infusorial earths, plastic clays and mineral paints; also of soda, manufacturing more and better soaps and yeast powders—make also soda of the caustic kind, the latter now obtained from England. As our soils become impoverished we shall have to use gypsum, which, fortunately, we have in great abundance. We have, in fact, nearly all of the above-named mineral products in great plenty, the most of them being also of good quality.

When we get to work in this new field, it will, we opine, astonish us by its richness; just as the land did by its unexpected capabilities. When that time comes it will bring with it such industrial activity as will further enhance property values and infuse additional life into business of every kind. With it will come an increased demand for labor, coupled with diminished importation of many articles and commodities now obtained abroad. Experimenting in the manufacture of the useful minerals and metals and these other crude products, improvement will come as it did from our trials in the province of agriculture. As we have succeeded in making an acceptable wine and a presentable raisin, so may we hope to succeed in finding a good cement and a superior marble, and so on through the entire list of these our resources held in reserve. These resources contain the elements of a wealth that must inevitably add largely to our already well-assured prosperity.

GRAVEL that will pay about \$4 a day for rocking has been found on a ravine which is a tributary of Steamboat creek, Washoe valley, Nev. Five or six Americans are at work in the diggings. Could sufficient water be had for eluicing, it is said the ground would pay \$8 or \$10 a day. The diggings were found by a couple of Mexicans.

ANY one in want of a metallurgist and assayer will do well to consult our advertising columns.

Neglected Gold-Bearing Lodes.

To us in California it seems a little strange that the people of England and other European countries will continue to mine for the ores of the precious metals in localities where these ores are of low grade, are generally base, and are costly of extraction, baving to be recovered from great depths, when they might embark their capital in the business on this coast under conditions so much more favorable. There are in this State literally thousands of gold-bearing quartz lodes that yield an ore from 200 to 300 per cent richer than the average worked in these older countries, the cost of extraction and reduction being but little greater here than it is there. Upon the most of these lodes little or no work has been done, for which and other reasons they can be bought at very small prices. The cost of one "going" mine would purchase a score of these unprospected or but little prospected lodes, a majority of which, with a moderate expenditure, would be pretty sure to develop into paying properties.

These lodes are not mines, but the most of them contain the elements to make mines of varying degrees of excellence, it being possible to determine their prospective, and even their positive values, without any great outlay of time or money. We have on various occasions called the attention of investors, both home and foreign, to this class of gold-bearing deposits as presenting an inviting field for new mining enterprises. What surprises us is they should seem so slow to appreciate its advantages. If money is going to be put into mines, this, it strikes us, is the direction in which it should go.

A New Feedwater Heater.

Paul Rossiter, chief engineer of one of the Pacific Mail Steamship Co.'s steamers, running between this city and Panama, has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a feedwater heater, which he has been using for some months successfully. The invention is a feedwater heater and drain-er from the jackets of steam cylinders. It consists of a connection and mechanism whereby the steam used for the jackets of steam cylinders, etc., to prevent condensation and variation of temperature of the cylinder and pistons, is carried directly into the main feed-pipe, and thence to the boiler, without itself passing into the hot well or condenser, as is usually the case. The cylinders of marine and other engines are usually surrounded by an exterior jacket into which live steam from the boilers is allowed to pass, and this heat serves to maintain an even temperature within the cylinders and piston, and prevents too great radiation and condensation within the cylinder. The water of condensation escaping from this jacket, passes into a receiver, through which it is usually carried to the hot well or condenser, from which it is pumped back into the boiler with other condensed water in the usual manner. This causes considerable loss of temperature during the passage, and also the heating up of the air-pump valves and other parts. Mr. Rossiter's new plan overcomes these objections. In his invention the water is taken directly from the receiver and delivered into the main feed-pipe so that it is carried directly into the boiler several degrees higher in temperature than could otherwise be accomplished.

THE MECHANICS' FAIR.—William T. Coleman and a majority of the other members of the "Committee of Twelve," have signified that they will accept the invitation of the managers of the Mechanics' Institute to co-operate with them in making this year's exhibition a greater success than any of its predecessors. As soon as possible a definite plan will be perfected whereby the best results may be attained.

THE Department of State has received information from the United States Consul-General at St. Petersburg that an agricultural exhibition, with competition in agricultural implements and machinery, will be held at Kharkoff, Russia, between the 2d and 22d of October, 1887. Americans can compete in the exhibit of horses, cattle, ewine, poultry and agricultural implements and machinery.

THE duties on the 10,000 tons of English steel rails to be delivered this summer at San Diego to the Atchison road will be about \$175,000.

Steam Coasting Schooners.

A new feature of late in the lumber trade of the coast is the use of auxiliary engines in the schooners which run between San Francisco and the mill ports. These vessels steam up the coast against the wind, and use both sails and steam to return, unless the fair wind is strong, when sails alone suffice. The trips are made regularly and quickly. The latest one of this class of vessels built is the Tillamook. She was constructed by Bolte & Breeden, and is 136 feet over all, 125 feet on the keel, 33 feet beam and 10 feet depth of hold. She has a registered tonnage of 210 tons, with an estimated carrying capacity of 350,000 feet of lumber. Her engines, constructed by Hinckley, Spiers & Hayes, of the Fulton Iron Works, are of 225-horse power. Pollard & Dodge, the lumber merchants, are the principal owners.

On Saturday last this new vessel was tried. She first went up the bay nearly to Hunters' Point, thence back along the city front and a short distance outside the heads; back through Raccoon straits as far as California City. At Sancelito the vessel stayed an hour or more. There were some 250 invited guests aboard, all of whom enjoyed themselves greatly.

The engines during the trip were in charge of Robert Christie, superintendent of the Fulton Iron Works. The machinery worked smoothly. The highest speed attained was 10 knots. The master was Capt. Robert Miner, who is part owner and will command the vessel. He was formerly captain of the schooner Vesta, and has been for some time engaged in the coasting trade. Linus Stewart, lately superintendent of machinery at Mure Island Navy Yard, and formerly a chief engineer in the Pacific Mail Steamship Company line, has been engaged as engineer of the vessel. The first business trip of the Tillamook will be to Fort Bragg, Mendocino county, to load with lumber for San Diego.

Plumas and Sierra Mines.

We had a conversation this week with B. W. Barnes, of La Porte, Plumas county, an old resident of that region. He states that, generally speaking, the mining interests of Plumas are rather better, as far as quartz and drift mines are concerned, though they have had to give up the idea of hydraulic mining altogether. Of course the mining industry is not what it was when the hydraulic mines could be worked. Last year around La Porte, the mines did better than before, and some new claims were opened.

The Bunker Hill, about eight miles above Gibsonville, but across the line, in Plumas county, is opening up splendidly and bids fair to be one of the finest mines in the State. The Dutch Hill country drift mine, up near Big Meadows, is also looking up.

In Sierra county the mines are doing well. The Lincoln Company, at Howland Flat, are doing first rate in their drift operations. The quartz interests of Sierra are increasing in importance. The Young America and other mines are paying handsomely and showing good clean-ups every month.

Mr. Barnes says that the Big Meadows, Plumas county, are becoming better known every year, and many people now go there in the summer. There are three good hotels in the meadows, and fine trout fishing. The scenery is fine and the summer climate unsurpassed.

THE STANFORD UNIVERSITY.—The cornerstone of the Leland Stanford, Jr., University was laid at Palo Alto last Saturday. No formal invitations were issued, and the whole affair was conducted in a very quiet, unostentatious way. Beside Senator and Mrs. Stanford, 18 of the trustees, and about a dozen other gentlemen specially interested, there were ladies, school children and neighbors present to the number of 300 or 400. The ceremonies were simple and impressive. Dr. Stebbins offered a prayer; Judge Lorenzo Sawyer, President of the Board of Trustees, made a fitting dedicatory address; and Senator Stanford himself deposited in the foundation a copper box of documents relating to the endowment and establishment of the institution, and with hammer and trowel laid the corner-stone in place above it.

At the request of the Japanese Government, Secretary Whitney has ordered the admission into the Naval Academy of H. Nic, aged 17, a Japanese youth of noble family.

A "Pioneer Saw."

C. P. Sheffield, one of the proprietors of the Pacific Saw Manufacturing Co., came to this State in 1850, and during that year went to Sierra county to repair a saw for Col. Durgins and afterward run the mill for him. In 1851

FIRST SAW MADE IN CALIFORNIA.

he built a mill near Downville with Messrs. Craycroft and others, and run the mill when built. He came back to San Francisco in 1852 to get an engine and boiler for a sawmill, but found he could get no circular saw. Therefore

The accompanying engraving is from a drawing representing the 600-foot pump station of a mine, with the Knowles compound condensing duplex pumping engine in place, and the sinking pump in position below the station.

STATION PUMP FOR MINES.

he had to make one or go without. There was no iron here large enough. He obtained some boiler plates, cut them into proper shape and joined them together to make a circular plate. Then he formed the insertible teeth and put them in. We give a sketch of this saw on this page, it being the first ever made in this State. It was used in the mill until a better one could be procured from New York. The mill was above Sacramento at a place called Twenty-six Mile House. The small pieces shown in the drawing were set in flush and mated so as to join the two pieces of boiler plate together to form the circle. There were 12 inserted teeth.

It was not until 1864 that the first muley saw was made here, and Mr. Sheffield had to do with that also, at the old shop on Battery and Jackson streets. This muley saw was exhibited at the Mechanics' Institute Fair. Now the establishment of which Mr. Sheffield is part owner, turns out an immense number of saws and various kinds of sawmill machinery every year.

The competition of the Canadian Pacific road on tea, silk and sugar from the Orient to the Eastern seaboard points will be met by the National transportation lines, and is one of the leading subjects of discussion before the Chicago convention now in session.

A Station Sinking Pump.

The accompanying engraving is from a drawing representing the 600-foot pump station of a mine, with the Knowles compound condensing duplex pumping engine in place, and the sinking pump in position below the station.

usually carried to the snmp or into a special connection arranged on the suction nozzle of the sinking pump. This connection is a condensing arrangement (not shown in the cut), and which does away with all exhaust steam-pipes in the shaft.

With an arrangement similar to that described, mines can be sunk to any depth desired, or flooded mines recovered with the greatest facility and security. For mines of extreme depth it has been found advisable to put pumping stations at every 500 or 600 feet distant apart, although this distance has been as great as 800 to 1000 feet, when desired. By this system, the compound condensing pumping engine in the lower station delivers to the next above (which is a duplicate of same), and so on to the surface. Below the lowest pump station is placed the sinking pump, as referred to above. Generally these sinking pumps are duplicated for convenience and security.

Alfred Russel Wallace.

That very distinguished naturalist and traveler, Dr. Alfred Russel Wallace, Fellow of the Royal Society, is daily expected in California, and will lecture next week in Pioneer hall, in this city.

Dr. Wallace has devoted himself to naturalistic studies and researches since 1845. He spent four years on the Amazon and eight years on the Malay archipelago, making extensive zoological collections. It was while living in the East that, without knowing of Darwin's cognate researches and speculations, he wrote a theory of development by natural selection, though not using the latter term. He, therefore, really published the theory of evolution before Darwin. He has published many valuable scientific works. Among these are "Travels on the Amazon and Rio Negro," "Palm Trees of the Amazon," "The Malay Archipelago," "Contributions to the Theory of Natural Selection," "The Geographical Distribution of Animals" (which practically founded a new science), "Tropical Nature," etc.

Dr. Wallace will lecture on Tuesday, May 24th, on Darwinism in general, showing what it is, or rather, what it is not. On the 27th he will deliver another lecture, taking some one special aspect of Darwinism. The lectures will be illustrated by means of a stereopticon. This will be an opportunity for all lovers of science to hear one of the distinguished men of the age on a topic in which he is thoroughly at home.

Mining Accidents.

An employee of the Kennedy mine, Amador county, had his arm broken by the falling of a large smokestack which they were taking down at the old mill.

M. H. Penhale met with a serious accident in the Sierra Buttes mine last Monday, by a cave of rock which struck him on the hip. Dr. Tilly was called to give the man the necessary surgical attention, and it is thought he will be able to resume his regular occupation in a short time.

On Wednesday last an accident occurred at the Chollar mine which resulted in the death of David Bertrand, by falling down the Chollar shaft, a distance of 100 feet. He lived long enough to be brought to the surface, and expired shortly afterward. He was formerly night foreman at the Combination shaft.

The Nevada & California Railroad Company is rapidly pushing its road north of Reno, Nev. About eight miles of road have been graded and a large force of graders is now at work. The surveyors have finally located the route to Hot Springs, in Lassen county, and are now at work extending the road to Madeline plains.

The Enterprise says that there are still many idle men on the Comstock, even among old settlers. New-comers wish themselves away about as soon as they land. Some who have been waiting there for two or three months have not yet got a job. Others have struck out for the lumber camps in the Sierras.

The Bisbee steam wagon takes the loaded wagons from Bradshaw's station to the town, a distance of nine miles. It makes a round trip daily, and hauls five of Carr's large freight wagons easily. The wagon is fast gaining favor in the eyes of the mine-owners of Bisbee.

MECHANICAL PROGRESS.

Gun Steel and Armor Plates.

The European iron-workers are still wrestling with the problem of how to make impenetrable armor plates and how to construct guns and projectiles to defeat any such effort. The great probability of an early and general war that may involve all the leading powers of Europe gives unwonted interest to these rival efforts. Our own country, although far removed from the immediate scene of the prospective conflict, should not and cannot remain a disinterested spectator to the contest.

The tests a dozen years ago at Spezia showed that the live projectile went clear through French all-steel plates, and cracked compound armor plates. If the shell should not get into the ship alive a clear-cut plate might be less dangerous than a cracked plate, for quick plunging ought to stop much of the threatened mischief; but a live shell is not so easily dealt with after it has secured an entrance, and so Sheffield reasons. It is but a few weeks since it was semi-officially announced that the superiority of French iron and steel had become so apparent that the English Admiralty had ordered some armor plates from the Creusot Works. It is also said that the United States has decided to place the same orders for plates for the new cruisers recently ordered to be built—one of which is now in process of construction in this city.

Still later comes the word from Sheffield that Messrs. Cammell & Co. have produced still a new style of plate with greater resisting power than any hitherto turned out. It is constructed in accordance with a patent recently issued to a member of that firm. It is said that the face of the plate is specially hardened to withstand penetration, and in addition to the customary iron hatching, it is further strengthened by a third stroke of ingot iron. The plate is also still further subjected to peculiar treatment known only to the manufacturers.

It is claimed that the remarkable success which has attended the experimental trials with this plate has once more placed defense in the ascendant, and Sheffield, which has greater interest in defense than in attack, is jubilant.

The aim of the inventor has been not only to secure rigidity under attack, and to resist penetration by chilled projectiles, but also to resist steel shot. It is claimed that he has been successful at all points, and if this first experiment of the kind should be confirmed by others, then compound armor plates as made in Sheffield have further established their position. It will now be for steel plates to prove themselves equally efficient.

While all this has been going on, another Sheffield firm has been experimenting on shells with the view of completing a large Government order for such projectiles. This firm has devised a 6-inch shell which, fired at Shoeburyness under Government conditions against a 9-inch compound armor plate, passed through unbroken and afterward entered three feet of granite. A 9-inch French shell, fired on the same day, failed to penetrate a 12-inch compound plate. Sheffield contends that the trial in which their 6-inch shells were successful was severer than that applied to the 9-inch French shell.

So goes the friendly war of competition between attack and defense. Which will win in the end, time alone can tell.

A NEW ANTI-FRICTION BEARING.—What appears to be an excellent anti-friction bearing is one among a number of recent inventions worthy of note. It is designed for vertical shafts that revolve at a high rate of speed and are required to support considerable weight. Briefly, below a collar secured by set screws, the shaft passes through a pillow block and hox, and terminates in a step which consists essentially of a hollow casting, within which the shaft-guiding socket fits. The socket is so formed that there is an annular oil chamber about the socket, fed by proper oil ducts, and, about in line with the bottom of the shaft, there are two oil ducts, leading from the chamber to the interior of the socket. The step merely acts as a guide for the lower end of the shaft, and not as a weight-supporting device, the weight of the shaft and its load being taken up by a series of anti-friction balls that rest within a groove formed on the upper side of the pillow block, a corresponding groove being formed on the under side of the collar. The box to which the pillow block is bolted is provided with three or more converging slots, in which are adjustable blocks made of any of the well-known anti-friction bearing metals.

THE MYSTERIOUS BURSTING OF GUNS.—The well-known civil engineer, Colonel Maitland, has suggested a new theory to account for the frequent mysterious bursting of guns. In dealing with the effects of forging and annealing upon the particles of the metal by checking and controlling the molecular vibration of the mass, the colonel has suggested a theory to account for the mysterious bursting of guns by small charges after passing severe proof. A six-inch gun and a 12-inch gun were thus shattered at their first round after lying idle for nearly two years, and the suggestion was that during this time the particles tended to rearrange themselves in obedience to internal strains, and in so doing permitted the development of lines of in-

ferior cohesion, if not of positive cracks. Col. Maitland says that he attaches great importance to annealing, even though it may undo the hardening, and he questions whether it is worth the risk of setting up internal strains by oil-hardening at all, except, perhaps, in the case of the actual lining of the gun.

NEW SOLID DRAWN COPPER TUBES.—The patent process for making solid drawn copper tubes introduced by Heaton & Sons, of Birmingham, is said to have proved a pronounced success. We recently gave some particulars of this process, but it may perhaps be well to recapitulate that round bars or "billets" of metal are fixed firmly in a matrix and are then pierced to the required diameter by the mandril which revolves and is forcibly driven forward. This is done without taking any metal from the "billet," since the mandril as it forces its way through spins aside the covering. Elongation of the metal is a natural consequence, and at one thrust a billet two feet three inches in length becomes a shell tube four feet long. It is then ready for treatment at the ordinary draw benches to be finished into tubes of any requisite diameter. The English correspondent of the *American Manufacturer* says that the firm is now greatly enlarging its works to meet the orders which are being received much faster than it can execute them. As an evidence of the manner in which the invention is appreciated on the continent, the patent rights have already been sold for several of the European countries, and negotiations are at the present time going on with other countries. Numerous manufacturers have been over Messrs. Heaton's establishment to view the process in operation, and without exception have expressed their surprise at the marvelous results so simply obtained. It would appear that the invention is effecting a great change in the former method of producing these seamless copper tubes.

AN ALLEGED VALUABLE DISCOVERY.—A discovery of a somewhat startling economic improvement has just been reported in some of the English technical papers. It relates to the matter of fuel combustion and the heating of steam boilers, and is said to be under experimental demonstration in the county of Durham. By this process, it is claimed, the cubic hulk of fuel that will henceforth be required for marine steam engines will be reduced by 70 per cent, giving a gain to the extent indicated by that proportion to the stowage space for cargo in ocean-going steamships. The time for raising steam will be diminished in all steam boilers, stationary or marine, by at least two-thirds. The cost of fuel consumption will be reduced by one-half; and the production of smoke will be absolutely annihilated. All arrangements in connection with the invention will shortly be completed, when a full description of the process will probably be available.

METALLIC CEMENT.—The *Chemist and Druggist* (London) tells us that the cement which was used in the restoration of the colonnade of the Louvre, of the Pont Neuf, and of the Conservatoire des Arts et Metiers, consisted of a powder and a liquid, prepared according to the following formula: 1. Two parts by weight of oxide of zinc, two of crushed limestone of a hard nature, and one of crushed grit, the whole intimately mixed and ground. Other in suitable proportions is added as a coloring matter. 2. A saturated solution of zinc in commercial hydrochloric acid, to which is added a part, by weight, of hydrochlorate of ammonia equal to one-sixth that of the dissolved zinc. This liquid is diluted with two-thirds of its bulk of water. To use the cement, one pound of the powder is to be mixed with 2½ pints of the liquid. The cement hardens very quickly, and is very strong.

POLISHING THE INTERIOR OF METAL TUBES.—The operation of polishing the interior of metal tubes is now accomplished with far greater facility than heretofore, especially in the case of lengthy pieces, by means of a recently devised machine. This improved apparatus contains a revolving shaft carrying a polishing head or disk at one end, and used in connection with a clamp composed of a sleeve having a split end, and of a nut for clamping the split end of the sleeve on the tube to be polished. In practice, the emery head is revolved rapidly within the tube; while the latter is being gradually carried forward, the shaft and the tube are rotated in opposite directions; hot water is applied to the tube by a hose-nozzle which is being carried forward with the tube, the whole arrangement being thus simple and effective.

STEEL VS. IRON.—As an evidence of the rapid manner in which mild steel is supplanting puddled iron for general use, it may be remarked that the production of puddled bar in England has largely and steadily declined during the last five years. In 1882 the production was 2,841,534 tons, and in 1886 it was only 1,616,701 tons, which is a decrease of nearly one-half. In the same interval the production of Bessemer and open-hearth steel increased 155,000 tons. The decrease of 1,224,833 tons in the production of puddled bar in this half decade named being compensated for only to the extent of an increase of 155,000 tons in the production of Bessemer and open-hearth steel, shows a serious decline in the production of the rolling-mills of England.

SCIENTIFIC PROGRESS.

THE DEPTH OF EARTHQUAKE DISTURBANCES.—In a communication to the National Academy of Sciences, Captain C. E. Dutton gives a calculation of the depth of the Charleston earthquake at the center of the surface disturbances, which puts it at the distance of 12 miles below the earth's surface. The calculation by Robert Mallet of the depth at which the Neapolitan earthquake of 1857 originated was the first attempt to solve such a problem. Working on the assumption that the earth wave radiates in straight lines from the origin, and hence at different distances from the center of surface disturbance it has different angles of emergence, Mallet found that lines drawn parallel to these angles, if projected, would intersect each other at a mean depth of about five miles under the surface. From seismometric and other indications the mean depth of the Yokohama earthquake of 1880 was calculated to have been about 3½ miles. While much greater depths of center have been assigned to some earthquakes, the accuracy of the calculations has been doubtful. Captain Dutton's new method of determining the depth of the focal cavity at Charleston gives, therefore, a most remarkable result. But his conclusion is in harmony with the observation of Mallet, that "earthquakes which have a very great area of sensible disturbance have also a very deep seismic focus."

A RED-HOT TELEPHONE TRANSMITTER.—Experiments have recently been made in England with a red-hot wire as a telephone transmitter. An account of these has been communicated to the Royal Society, Prof. G. Forbes and Mr. John Munro. A fine platinum wire, several inches long, was included in the circuit of a charge accumulator, and this primary wire of an induction coil. A receiving telephone was connected in circuit with the secondary wire of the induction coil. The battery power was such that the fine wire in the primary circuit was heated to a high temperature and rendered incandescent. When in this condition, on speaking to it the words could be heard in the receiving telephone. The explanation of the phenomenon is, that the sound waves passing the incandescent wire in quick succession altered its resistance by cooling, and thus varied the strength of current in the primary circuit. The fluctuations of current thus caused excited corresponding fluctuations in the secondary circuit, and these reproduced the voice in the receiver. Spiral wires in the form of watch-springs, of steel and platinum iridium, were tried in place of the straight wire with some success. An india-rubber diaphragm was also interposed between the voice and the heated wire, and found to influence the wire like the direct voice. Mechanical vibration did not affect the apparatus.

TRACING OCEAN STORMS.—The International Marine Signal Service, recently established in this city, is becoming very important to sailors. Captains of vessels about to sail from European ports for America can learn with tolerable certainty whether they will encounter unusual storms on the voyage or not, and if so, where they may expect to encounter them. Signal-service midnight reports are telegraphed across the ocean from Washington every 24 hours. The system of gathering data is as follows: The captains of vessels are required to make certain meteorological observations at stated periods during the passage, and, upon landing here, deliver them to the marine signal station. These observations are relative to the variations of the barometer, the temperature and the velocity and direction of the wind. This information is then sent to Washington, whence it is transmitted to European ports. Thus, if a severe storm is encountered on this side of longitude 45° west, the captain reports its velocity on landing, and his data reach Europe in time to notify sailing masters on the other side where they will meet it. In this way each steamer becomes a floating signal-service station.—*N. Y. paper.*

THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.—The thirty-sixth annual meeting of the American Association is to be held in New York, during the week beginning August 10th. The Academy of Sciences has among the local societies taken the lead in the matter of arranging for the reception of the national body, by appointing a committee of conference to secure concerted action among the different institutions of the city. Committees on ways and means, and other permanent organizations, it is hoped, may be early brought about, as the time is none too long at the best. The meeting last year, at Buffalo, was not a very large one, and offered a contrast to the great Philadelphia meeting of 1885. It is to be hoped that the metropolis will serve as an attraction, and secure the presence, not only of representative American scientists, but of European ones as well.

A FIELD FOR WORK UNDER THE SEA.—A writer in one of our contemporaries suggests the development of submarine navigation as one of the works of the future. He contrasts the amount of time and thought which has been expended upon the solution of the problem of flight with the little that has been done in the other field. Men have ever shown themselves more anxious to rival the birds than to cope with the element of the fishes. Yet under the

waters all is peace, where on the surface the floating ship is exposed to the maximum wave action of the unstable elements. The character of instability disappears from the ocean at a small depth, and 30 or 40 feet down it is the type of constancy of conditions. The prediction is formally made by the writer in question that in the future this mode of journeying will be extensively indulged in. Then Jules Verne's work will read like a prophecy, and 20,000 leagues, and many times that, will annually be sailed under the sea. Such are substantially the conclusions of our writer. Whether they will be verified or not must he left, we fear, to future generations to see.

THE BOTANIC GARDENS OF THE WORLD.—According to a report of the Montreal Horticultural Society, there are 197 botanical gardens in the entire world, and they are thus distributed: France and her colonies, 25; England and Ireland, 12; the English colonies, 27; Germany, 34; Italy, 23; Russia and Siberia, 17; Austria and Hungary, 13; Scandinavia, 7; Belgium and Holland and colonies, Spain and colonies, and the United States, 5 each; Portugal and Switzerland, 3 each; Denmark and Roumania, 2 each; Brazil, Chili, Ecuador, Egypt, Greece, Guatemala, Japan, Peru and Servia, 1 each. The list may be completed by mentioning the gardens of Geneva and Louvain, and a few that have recently been organized in English India. At least half of the gardens mentioned above are kept up by the Government, 18 per cent by universities, sometimes in conjunction with the general or city Government, 11 per cent by cities alone, and 5 per cent by private donations. Out of the same number 94 per cent are always open to the public, 70 per cent are open to visitors on Sunday only, and 73 per cent publish reports or contribute in some such way to scientific research.

TURKEY RED FROM CASTOR BEANS.—A. Braunstein has taken a German patent for the direct production of Turkey red oil from oleaginous seeds, as follows: The oil seeds, castor beans preferably, are first freed from their shells by passing them through horizontal rollers, then washed, and treated with strong sulphuric acid of at least 66° Be. The acid may be mixed with the seeds, and the mass ground up together; or the seeds are ground to a fine meal and treated with the acid in a suitable vessel with a stirrer, and which can be kept cool. After 40 to 60 per cent acid has been gradually added and stirred together with the meal, the mass is allowed to rest for several hours, when the sulphated oil, which has separated out at the top, is drawn off. The sediment is then washed out with two waters, to extract from it the remaining oil, and the washing waters being added to the first product, the whole is again allowed to stand for several hours, when some common salt is added to completely separate the sulphated oil, which is then neutralized with ammonia or caustic soda in the ordinary manner.

TRANSPARENCY OF MOLTEN IRON.—According to *Engineering*, it has been observed that the molten iron seen during a casting of several tons is transparent. It was possible to see hodies through the stream of metal, they taking, however, a yellow tinge. The observation is one of much interest, and perhaps others engaged in the iron industry will be able to confirm it, since it is hardly likely that the phenomenon has not been witnessed before. In noticing the above, a correspondent of the *Iron Age* remarks as follows: "My experience has been that iron of certain grades will, when flowing over the dam in the runner below the skimmer (as practiced in running iron at blast furnaces), be frequently so transparent that the sand over which the metal is passing will be distinctly visible, though of a yellow tint. The writer has observed this not infrequently for the past 10 or 15 years, and has called the attention of others to it. All grades of iron are not transparent in flowing."

LIGHTNING AND WHERE IT IS MOST LIKELY TO STRIKE.—Dr. Hellmann, of Germany, has recently discussed the probabilities of lightning. He finds no basis for the conclusion that lightning strokes are increasing, in that country at least. The striking of any particular building depends upon its height, material, comparative isolation, and the soil upon which it stands. His investigations lead him to the conclusion that for every stroke upon limestone ground we may expect seven on clay soil, nine on sand and twenty-two on a loam. In open plains the danger is greater than in the city. In the kind of trees selected, it appears that an oak is struck 54 times against the beech once.

FREEZING MIXTURE.—A liquid invented by Raoul Pictet, of Geneva, Switzerland, for use as a disinfectant, answers well as a freezing mixture for hardening microscope specimens. Sulphur dioxide and carbon dioxide, having been mixed and cooled, are compressed until they are liquid, and stored in siphons. When liberated, they rapidly evaporate with great reduction of temperature. By this means mercury may be frozen and animal or vegetable tissues rendered solid in a few seconds. It is as easily managed and more effective than ether, the odor being the principal objection.

GUM BAGS which have become stiff and hard from use may be rendered pliable by immersion for a limited time in coal oil.

ENGINEERING NOTES.

A CABLE ROAD IN CHINA.—At Hong Kong a cable road has been constructed from the town to the peak, a range of very steep hills, on which are fine villa residences, and where the climate is more salubrious than near the harbor. The incline on which the road operates is 4800 feet long, and the line, which is partly single and partly double, is laid with 35-pound steel rails on steel sleepers. The gradients vary between 1 in 2 and 1 in 10, closely following the natural contour of the ground. The total height to which the cars have to be raised is 1300 feet, and the ropes, of which one is the working rope and the other the safety rope, run on separate sets of friction rollers. The cars are attached to each end of the ropes, and as one pair of cars ascends the incline the other pair descends. Each car is to contain 60 passengers, the maximum load being 7½ tons at each end of the ropes. The working rope is passed over a pair of drums eight feet in diameter, and the safety rope over one drum, the drums being fixed at the top of the incline and driven by two compound steam engines, 40 nominal horse-power each. The speed of the cars is to be six miles an hour.

CHEAPENING RAILROAD TRANSPORTATION.—One of the means by which railroad transportation has been cheapened is by greatly increasing the amount of load drawn. Two and even three times the amount of freight that used to be put on the cars can now be drawn. But this is, of course, accompanied by proportionate increase in both strength and weight of engines. Now the question that sorely puzzles many railway managers is, whether bridges built years ago will bear the additional strain now put upon them. Some of the largest and best engines on certain roads are put aside, because too heavy for the bridges over which they must run if put in service. An enormous outlay is now required on nearly all railroads in rebuilding and strengthening bridges to adapt them to the present requirements of railroad traffic.

THE AFRICAN INLAND SEA AND DESERT RECLAMATION.—According to the *London Times*, southern Tunis is being transformed by Captain Lendais, who is continuing the scheme of the late Captain Roudaire for an inland sea. The artesian wells now being sunk by him yield a large quantity of water, which is utilized in agriculture by the natives who collect around these new oases. Gardens are being created where, till recently, there was nothing but sand; and avenues of trees are growing which will one day be bordered by houses. In a few years, if the operations are continued, the whole region will have been converted from a desert into a garden. Artesian wells, without any change of climate, which it was at first suggested, should be brought about by converting a portion of the desert into an inland sea.

DISAPPEARANCE OF THE NARROW GAUGE.—The supplanting of the narrow by the standard-gauge width of railroad tracks goes on quietly but steadily. Attention is called by the *New Orleans Times-Democrat* to the gradual extinction of the narrow-gauge system at the South, where at one time it was preferred to the broad gauge. Narrow-gauge roads of Texas were left without an outlet last year by the change on the Panhandle line. The Houston East & West railway, running from Houston to Shreveport, will be converted at once into a standard gauge line. It seems only the question of a short time, says the above-named paper, when the narrow-gauge railroad will have disappeared.

LATEST NOVELTY IN RAILROAD EQUIPMENT.—The latest novelty in railroad equipment is the abandonment of the monitor top the standard adoption of a round-roof passenger car. The arch, of course, is vastly stronger than the broken line formed by the monitor, and is practically as strong as the sides of the car. The Boston & Albany has been running them for some time, and now the Bradley Car Works, Worcester, are building 20 round-roof cars for the Boston & Lowell road, and five suburban and four passenger cars for the Chicago & Eastern Illinois road.

THE TEHUANTEPEC SHIP RAILWAY.—It was feared that the Tehuantepec ship railway would suffer irretrievably by the death of its illustrious projector, Captain Eade. It is, therefore, gratifying, says an Eastern exchange, to know that Messrs. Andrews and Corbitt, who were assistants to the famous engineer in his lifetime, will now be able to carry forward the work of uniting the two oceans by rail. The interest in this isthmian highway is keen in America, and Congress alone is responsible for the delay in the consummation of the task.

PETROLEUM FOR EGYPTIAN LOCOMOTIVES.—Experiments have recently been made in Egypt on the line of railroad between Cairo and Alexandria, in using petroleum as a fuel for firing locomotives, it is claimed with success.

It has been demonstrated that the finer a screw propeller is in pitch, and the greater its speed of revolution, the more efficient it is likely to be. Important practical illustrations are available to support this argument.

USEFUL INFORMATION.

Colors From Coal Tar.

Prof. Watson Smith, of Owens College, Manchester, England, in speaking of colors obtained from coal tar, recently said: Formerly they used to rely principally upon vegetable dyes of animal origin. The vegetable or wood dyes, however, had to a large extent disappeared, and there were not many of these with which they needed to trouble their minds, because they had been replaced, and would be still further replaced, by other materials. There were really only two of these vegetable dyes remaining—indigo and logwood—all other wood dyes having been already more or less replaced by coal-tar dyes. Lac dye had been entirely displaced and the consumption of cochineal had been reduced to probably less than 200 tons per year. A great deal has been said against coal-tar dyes. They were told that these dyes were fugitive and poisonous, and that there could not be produced from them as fine a shade as was obtained from the vegetable dyes. Now all this was fallacious. It all that had been said against coal-tar colors was true, one would naturally be led to suppose that the consumption of them would decrease. But what was the fact? Why, in the last year the consumption of these coal-tar colors had increased more than 33 per cent. Trade last year was bad all over the world—they hoped that this year it might be better—yet this increase of consumption had taken place quite exclusively, he should say, in compound colors. No fabrics were now dyed in any of the pure colors, and the increase of consumption had taken place in judiciously blending these colors with themselves, or with vegetable dyes. A card of "spring shades, 1887," gives 150 different colors obtained from coal tar, without indigo or any vegetable dyes. These colors comprise many bright and most delicate shades. The amount of coloring matter derived from a ton of coal is very large; while the dyeing power of the coloring matters derived will astonish any thoughtful mind, for the magenta will dye 500 yards of flannel, the aurine, 120 yards, the vermilline scarlet, 2560 yards, and the alizarine 255 yards (Turkey-red cotton cloth). It should be borne in mind that all this coloring matter is derived from what was formerly the mere waste and worthless refuse derived from the coal in the process of the manufacture of gas.

A NEW MODE OF PRESERVING WOOD.—The *Technologist*, says the *American Architect*, describes a simple method of treating wood with preservative solutions, which is applied in Norway to telegraph poles. After the poles are set in place, a man goes from one to another with an auger, with which he bores a hole in each post, beginning at a point about two feet above the ground, and boring obliquely downward at as small an angle as possible with the axis of the post, until the point of the auger reaches the center of the stick. The auger-hole should be an inch in diameter, and, in telegraph poles of the ordinary size, will hold easily four or five ounces of sulphate of copper, which is put into it in the form of coarsely powdered crystals, and the opening then stopped with a plug, the end of which is left projecting as a handle, so that it can be pulled out and replaced. Just what action it may have then goes on in the interior of the stick, no one pretends to say; but it is found that the crystals of copper sulphate disappear slowly, so that every three or four months the charge must be renewed; while the wood, both above and below the auger-hole, even to the very top of the pole, gradually assumes the greenish tint due to the presence of copper in the pores.

THE SOURCE OF MANNA.—Sicily is the chief source of manna. In that country the trees are cultivated in plantations, and when about eight years old they begin to yield. Out an inch and two inches long are made in the bark, cutting through to the wood. One cut is made daily, beginning near the bottom of the trunk, with each succeeding cut about an inch above the former one. The thick, syrup-like juice exudes from the cuts and hardens on the bark into white, spongy flakes, which, when hard enough, are removed and dried still further before they are packed for commerce. If consumed mainly of a form of sugar called manite and has mild laxative properties.—*Ex.*

THE JAPANESE are rapidly becoming the Yankee race of the Indies. They have already railways connecting Yokohama with Tokio, and another from Kobe to Osaka and Kioto, both routes of the first importance to travelers. These lines will be extended to all parts of the country; but the work of construction is not pushed with vigor. In telegraphs, too, Japan is making good progress. She has two lines connecting with Europe, one passing by Hong Kong and India, the other by China and Siberia. There is now a question of establishing another line, passing by the Hawaiian islands and America.

AN ANESTHETIC BULLET.—The *Court Journal* (London) states that a German chemist has invented a new kind of anesthetic bullet which he urges will, if brought into general use, greatly diminish the horrors of war. The bullet is of a brittle substance, breaking directly when it comes in contact with the object at which it

is aimed. It contains a powerful anesthetic, producing instantaneous and complete insensibility, lasting for at least 12 hours, which, except that the action of the heart continues, is not to be distinguished from death. While in this condition the bodies may be packed in an ambulance and carried off to hospitals or as prisoners. War, it is claimed, by this humane invention, will be reduced to a mere pastime, and the nations may indeed beat their swords into plowshares and their spears into pruning-hooks.

AMERICAN MACHINERY FOR EXPORT.—The inquiries for American machinery for export are of such number and character as to point to the probability of a great increase in demand for our machine-shop products. Ten or 12 cities are now working on contracts for improved machines, among which are Jersey City, Providence, Boston, Chicago, Pittsburgh, and Rochester, N. Y. A tool company in the latter place has just shipped an engine to Japan and one to South America.

A GRAYISH BLACK COLORING ON COPPER, according to the *Illustrirte Zeitung*, may be obtained by placing the object for treatment, after being well cleaned, in a weak solution of liver of sulphur. When a caustic effect has, after a short time, been produced, the object is rinsed, slightly beated and brushed with a stiff brush. This coating is said to be very durable.

The following is a list of the heaviest hammers in Europe from a historical point of view: Fr. Krupp, Essen, 1867, 40 tons; Terni Works, Italy, 1873, 50 tons; Alexandrowski, Russia, 1874, 50 tons; Creusot, France, 1877, 80 tons; Cockorill, Belgium, 1885, 100 tons; Fr. Krupp, Essen, 1886, 150 tons. The latter is now the heaviest hammer in the world.

AN ARTIFICIAL IVORY of creamy whiteness and great hardness is made from good potatoes washed in diluted sulphuric acid, then boiled in the same solution until they become solid and dense. They are then washed free from the acid and slowly dried. This ivory can be dyed and turned and made useful in many ways.

THE TENACITY of various metals may be correctly estimated by the resistance which wires of the same diameter experience when passed at equal temperatures through the same hole of a draw-bech. Taking steel at 100, iron has 88, brass 77, gold 0.750 fine 73, copper 68, silver 0.750 fine 54, zinc 34, tin 11, lead 4.

GOOD HEALTH.

Treatment of Biliousness.

The symptoms of biliousness are unhappily but too well known. They differ in different individuals to some extent, however. A bilious man is seldom a breakfast-eater. Too frequently, alas! he has an excellent appetite for liquids, but none for solids, of a morning. His tongue will hardly bear inspection at any time; if it is not white and furred, it is rough at all events. The digestive system is wholly out of order; diarrhea, or constipation, may be a symptom, or the two may alternate. There are very often hemorrhoids, or loss of blood even.

There may be giddiness, and often headache, and acidity or flatulence, and tenderness at the pit of the stomach. The pain felt in the right shoulder would indicate an extra bad case, but apart from this there are aching pains and even stiffness in the limbs, with more or less of orpime in the limb muscles, or burning in the palms of the hands, with hot, perspiring feet.

There may be drowsiness or torpor by day and sleeplessness at night, and all sorts and conditions of minds, especially irritability; fits of bad temper that come on suddenly and go off again, and that none are so thoroughly grieved at as the poor patient himself.

Bilious people generally fly for relief to aperient pills, and there is no doubt that they often afford temporary relief by relieving the over-gorged liver. This really is antiphlogistic treatment, but it assuredly is not radical. When a fish-pond overflows its banks, we may let off a portion of the water; but after this we ought, methinks, to find our way to the other end of the pool and lessen the inflow.

Well, just a word about treatment: First and foremost, then, in sudden bilious attacks, that are often accompanied by great prostration and by urgent vomiting, it is best to send for a medical man. Such attacks generally come on in the morning, at the time the body is most weak. I do not think upon the whole I should be justified in suggesting medicinal remedies in this paper, for the simple reason that cases differ so.

Little good will accrue from treating a case like this, however, if, when he is once more well, the patient returns to his old non-hygienic habits of life.

"What am I to do, then?" may he asked. I will tell you what you are *not* to do. You are not to overeat; you are not to use sugar or fat to any extent, puddings, pastry or cheese. You are not to touch alcohol. You are not to sit in overheated rooms. You are neither to overwork nor overworry yourself, and you are not to shirk the morning sun nor plenty of exercise.

What are you to do for the acidity? Abstemi-

ousness and regulation of diet and habits will entirely banish it, and you will have the pleasure of knowing that its absence is a sign of rejuvenating of the liver.

If you but try a week of the treatment I suggest, I feel convinced you will once more feel a pleasure in life and an interest in all your surroundings. I shall be quite satisfied with my present paper if it put a few of my readers on the right road to health, and that can only be got at by seeking for and removing first causes instead of treating symptoms.—*Cassell's Magazine.*

A Health Talk in the Nursery.

Health, and temperance, which in its broadest sense is the law of health, used to be taught from the cradle.

When my little four-year-old boy discovered the veins in my hands, I was obliged to lay down my pen and give a plausible answer before his childish curiosity would be satisfied. On being told they were little rivers carrying blood, an exploration of his own chubby hands followed, with the delightful discovery that he, too, had these "little rivers." Of course a volley of questions were fired at me in quick succession, the first of which was: "What is blood made of?" "What we eat." "What do the little rivers carry when I eat to my hands for?" "To make them grow." "Does everything we eat make our heads grow?" In that way he soon learned that some kinds of food furnish better building material for his bodily house than other kinds, and afterward, when inclined to eat something that was not suited to his child's stomach, I had no difficulty in inducing him to deny himself, when reminded of the work of the "little rivers." He does not want tea and coffee, because in our talks he has learned that they hurry the nerve-builders; but is a staunch friend of milk and brown bread, and takes great interest in his food, and by this means is learning to have power over his appetite, and exercise self-control. On discovering a picture of a man drinking beer, his first question was: "Does beer make my house grow?" On being told that the alcohol of the beer drank up the water in the "little rivers," and injured them, he voluntarily pledged himself against intoxicants, because he is inspired with an ambition to possess a fine bodily tenement.

His delight is unbounded if, when taking a bath, he discovers in some part of his body a vein heretofore unknown to him. I consider that here is foundation for a desire to make his body a splendid creature, with every nerve steady and every muscle trained to do his bidding. His imagination makes the wonderful little builders very real, and he will not intentionally retard their progress. He is willing to retire early because his house is being built more rapidly while sleeping and the very best work is done the first half of the night. We have even gone a step higher in our little talk, and learned to reverence the Creator of such a wonderful building, and that it is a sin to abuse a house so costly and beautiful, because it is God's workmanship. And all this came about without "cramming" his mind. The questions naturally came, at intervals, even after I had forgotten our previous talk, and it was better to give the little philosopher a reasonable, satisfying answer. He is a child of only ordinary intellect, so I believe every fact and law of physical life can be taught the child very early, and physiology become a fairy tale to the imaginative child, and they are all such. Every woman, for this reason, if for no other, should at once enlist in the department of hygiene. You owe it not only to yourself and community, but most surely to your children, whose first years are spent entirely with you, and at a time, too, when lasting impressions are made; the early impressions enter into the solid masonry upon which manhood is built. Some one has likened the knowledge acquired in maturity to paint and whitewash.—*Ex.*

A VALUABLE SURGICAL DISCOVERY, it is claimed, has been made by Dr. Chaigneau, of a new method which he has introduced for the treatment of scalp wounds. The account is given as follows in a medical journal. The locality we presume to be New York City: Assistant Police Surgeon Chaigneau is elated over a novel and valuable discovery which he has made in surgery. It is a new method of treating scalp wounds, and is as simple as it is effective. When a person suffering from a scalp wound applies at the Receiving hospital for treatment, Dr. Chaigneau does not shave the patient's head, nor stitch and bandage the wound. He merely gathers a small tuft of hair on either side of the wound and draws each in opposite directions and across each other, forming an angle directly over the mouth of the wound. The lips of the wound are thereby drawn as close together as if they were stitched. The next step is to tie the tufts of hair with a silk thread around the angle formed by the juncture. These knots of hair are made at intervals as far apart as the ordinary stitches in a wound. The tufts are kept in position until the wound heals, and while this process is going on, any pus that may form can escape. This discovery is of value, for the reason that the stitching of a scalp wound is objectionable, in that it is likely to irritate the flesh. The fact that it does not necessitate the shaving of the head enhances the value of the discovery, because the wound or scar can be concealed.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

STRUCK CHROME.—Livermore Herald, May 12: About two months ago, Peter Classen, the veteran chrome hauler, suggested to H. H. Pitcher that he thought he could strike a chrome ledge on the old Ab Mendonball claim. Mr. Pitcher remarked, "All right; if you find a 100-ton ledge, I'll give you \$100 and pay you \$3.50 a ton for hauling." Classen accepted the offer and went away, and Mr. Pitcher thought no more of the matter. Some two weeks ago, however, Classen started out with Wm. Keenon and John P. Olsen as assistants. They started in just west of the old workings, from which so much chrome was taken, and ran in a tunnel. Last week they struck a ledge which is opening out in good shape. We are informed that it is one of the best looking faces yet struck in the district. They came down on Sunday, but they are now back again, pegging away taking out chrome. The quality is excellent.

Amador.

SUTTER CREEK.—Cor. Amador Dispatch, May 13: J. H. Tibbits, superintendent of the Iowa M. Co., says that his mine has never looked as well as it does at present. He has a full force of men at work, who are running their mill night and day. Operations at the Wildman have quit, and it will be some time before they commence again. G. W. Horn has some 25 men at work on the Mahoney, and is still running 40 stamps. Operations are confined entirely to the surface. Last Sunday was cleanup day, and knowing ones say it has been the best cleanup made under this management. Sutter creek, one of the loveliest spots in this county, which has been so dull of late years, has at last taken a fresh start in the way of prosperity. Some of the old mines which have lain idle so long are on the verge of starting up again—one in particular, the North Star, which is going to be opened up before long, and operated principally by Sutter creek capital. They intend putting up machinery and sinking a shaft 1000 feet.

BIG TUNNEL.—Ledger, May 14: The men operating at the big tunnel at Middle Bar were discharged last Monday, and as far as that enterprise is concerned, matters are at a standstill. There were from 15 to 20 men at work. Nothing is now being done, unless it is a man or two working in the upraise on the lookout for pockets. A number of rumors are afloat concerning the speedy resumption of work. The cause of the suspension of active operations is no doubt the misunderstanding existing among the stockholders, and work on any scale of magnitude is not likely to be resumed until the differences are settled. Affairs at the Moore mine, which is, in a great measure, involved in the complications affecting the Middle Bar tunnel, being owned by the same parties, are moving along at a very slow gait.

NEW LONDON.—This property continues to develop fairly. An idea has got abroad, founded merely upon the fact of such exceedingly rich ore, showing such large quantities of free gold, being taken from it, that it is merely a pocket-ledge. There is nothing to justify such a conclusion. Similar rich discoveries have been made in every prominent mine in the county, with perhaps the single exception of the Zeile, where the rock is remarkably even in grade. At the Pacific, adjoining the New London, immensely rich quartz has been taken out, also at the Keystone, South Spring Hill, Gover, and Bunker Hill. The ore of the New London, as far as explored, gives every indication that the ledge throughout will come up to the paying standard, and probably exceed the average yield of the mother lode. The main shaft will be run about 100 feet deeper, when the opening up of levels will be entered upon. They are also sinking a new shaft about 300 feet north of the main shaft. This is mainly for ventilating purposes, and is smaller than the working shaft. We understand it will be put down 300 feet, at which depth it will be connected by drift with the main shaft.

Calaveras.

MURPHYS.—Cor. Calaveras Prospect, May 13: Within two miles of town, near Williams' ranch, is a very favorable field for the prospector. Pockets are frequently found and very rich lodes are numerous with more or less excellence. The Lillie mine in that district, owned by Lillie, Coleman & Morehead, is a mine of considerable promise; the shaft has reached a depth of 67 feet. The vein is well defined, and free-milling quartz is now being hauled to a custom-mill for reduction. Recently an engine was erected on the mine for hoisting and pumping. In proximity to the Lillie is the Mammoth, a large lode averaging eight feet in width, owned by Mr. Dodson. Some quartz was milled from the mine a short time ago that panned out liberally. Another large vein near by is owned by Geo. Taylor. The Silver Rufe gives evidence of permanency and prospects well. The Oro Plata Co. paid off on the 28th ult. Everything is about the mine in its first-class order, and the mill continuously running on quartz of fair quality. Three Burleigh drills are now at work stopping. The ore body is large and well defined. McCormick & Co.'s gravel claim on Central hill is giving a good account of itself, and slickens will, a century hence, add its mite to cover up the catfish in Mormon slough.

GOLD.—Calaveras Chronicle, May 14: The Central Hill gravel claim, owned by McCormack, Bissbee & Thomas, located at Murphys, this county, is turning out a large amount of gold. One pan of gravel taken from the bedrock yielded \$108.

Fresno.

HILDRETH NEWS.—Fine Gold Miner, May 13: Considerable ground was broken during the week in the shaft of the Hildreth mine; the ledge is two feet between walls; the quartz is of very good milling quality; the superintendent started the mill last Friday; about 475 tons of ore lies on the dump; the blankets of the concentrators show about three per cent of good sulphurets; through the center of the ledge every few feet is found pockets of decomposed quartz that are very rich, and scarcely a day goes by that specimens are not found, which are shipped to San Francisco by express to Wm. Dunphy. Prospects are looking bright at the James and Francis mine. During the last week the develop-

ment of ledge and ledge-matter has increased considerably, and, as indications now show, the property would undoubtedly justify the owners in erecting a 10-stamp mill. The shaft is 265 feet deep, with 100-foot levels east and west, all of which are in ore. The six levels of the McNally mine are being driven ahead in good ore. The ledge will average 2½ feet between walls, and carries considerable talc, which works through their 10-stamp mill very easily. They are crushing 20 tons daily. Mike Walsh is sinking in good ore in the Black Hawk. Prospects in the vicinity of the Mountain View have been changing hands recently, and this is looked upon as an indication of confidence in the section. It is rumored that John M. Wilson has bought the Zebra mine, which means that J. B. Haggin and George Hearst will own the controlling interest. Applegarth has gone to Fresno to conclude the sale of the Morning Star mine, and we understand that his partner, Mr. Parker, will add two of Redstone's mills to the one that is now upon the property. Mr. Robinson, of Fresno City, lately refused to take \$15,000 for a half-interest. This mine joins the Rough and Ready prospect that is being worked by the Baker Bros. Joe Seaton visited Hildreth last week, and reported that mining is looking up at Old Fresno Crossing. The district is alive with prospectors locating claims, while some are doing good work upon ledges that mill \$25 per ton coarse gold. The ledges in this vicinity carry less sulphurets than those around Fine Gold or Hildreth, but the difference in silver is very great. The company that owns the Spangle gold mine has decided to build a 10-stamp mill, which will be running by the 1st of August. The ore by mill test works about \$40 per ton. Considerable work is going on at the Wilson mine. The superintendent is working a force of miners in the shaft night and day. The ledge is over two feet wide, and has been for the last 40 feet. The ore is similar to that on the dump, part of which has been worked through Smith's arastra, netting \$65 in coarse and fine gold per ton. Lee & Byrnes have struck some very rich rock in their Table Mountain prospect. T. W. Robinson reports that the Big Bonanza has developed 2½ feet of ore that will, without assorting, pay to run through his arastra. The Hildreth mill is doing good work, crushing 12 tons every 24 hours, and showing good results upon the plates. Night and day shifts have been put on at the Black Hawk, and the owners will push the work in attaining depth as rapidly as possible.

Mono.

THE BULWER CON.—Bodie Miner, May 16: Upraise No. 1, 200-foot level, has been advanced 14 feet, showing the ledge four feet wide. North drift, 150-foot level, has been extended 11 feet; the vein at this point is two feet wide.

THE BODIE.—The east crosscut, 900-foot level, was driven 25 feet, with no change to report in the character of the rock cut through. The south drift was advanced 13 feet, showing about one foot of broken vein. The work of cleaning out the 100-foot level is about finished, and during the coming week we will start drifting to the south.

CON. PACIFIC.—North drift has required some timbering, but has been advanced six feet; no change in amount or quantity of ore extracted since last report.

MONO.—The west crosscut, No. 2, was driven 10 feet in hard blasting rock.

Nevada.

THE OMAHA AND LONE JACK MINES.—Grass Valley Union, May 13: Among the other idle mining properties upon which work will be resumed this season in the Grass Valley district are the Omaha and Lone Jack, which are located on the same lode, and have been consolidated under one incorporation. The Lone Jack is an old location, which dates back to 1855, and was worked as late as 1866, when, requiring stronger machinery for pumping, it was closed down, and operations were never afterward resumed. An incline shaft was sunk upon the vein to the depth of 625 feet. The average width of the vein was about 18 inches, and first and last it yielded a considerable amount of high-grade rock. In 1862 there was a crushing made of 1300 tons of quartz, which gave an average yield of \$62 per ton; and the full yield of the mine up to the time it was shut down was upward of \$500,000. For many years the Lone Jack was the property of Cyrus T. Wheeler, of Sacramento. The Omaha is a later location, and was first opened for regular working about 12 years ago. A large amount of ore was extracted, and the incline shaft sunk to the depth of 500 feet. Drifts were run south toward the Lone Jack, and it has always been the supposition that the existence of the pay chute in that direction was demonstrated and showed the necessity of the consolidation of the two properties, which could not be accomplished at that time. By consolidation, there is no doubt that the property can be worked to a profit, and the openings that have already been made will enable quartz to be taken out as soon as the Omaha shaft is freed from water. The machinery will be operated by water-power, which will lessen expenses over what was incurred when the mine was formerly carried on. The McCreary brothers, of Sacramento, are large owners in the new company. Preparations for work will soon be made.

DEBRIS DAMS AT OMEGA.—Transcript, May 12: Some Chinamen have taken possession of the old Omega gravel claim in Washington township, and are hydraulicking with good results. The results are good because a great deal of gold is being taken out, and no harm is being done, neither is any order of court being trespassed. To hold back the debris, there is in the main outlet a timber dam 175 feet long and 18 feet high, and above this at intervals, three brush dams, each approximating 125 feet in length and 6 feet in height. There are two other brush dams in branches of the stream through which the tailings might otherwise escape. These structures impound the tailings effectually, and anti-miners who have been there to observe the operations cannot help admitting it.

Placer.

FOREST HILL.—Cor. Placer Argus, May 11: The Mountain Tunnel machinery being in need of repairs and cleaning, they have been idle this week. Several members of the company were up a few days ago from S. F. Forest Hill will soon have a rival town; that ancient burg with the euphonious name of Yankee Jims is looting up, awaking from

its long sleep, and ere many more years roll around, will once more be a booming mining camp.

Plumas.

LOCATIONS.—Greenview Bulletin, May 11: Business seems to be lively at the Indian Valley mine, through not of an encouraging character. Several days ago Judge Emmons made a quartz location, which takes in the ground on which the mill, dwelling-houses, etc., are situated. We also learn that D. A. McKenzie has made a location called the Empire claim, which adjoins the Union, and takes in what has been known as the "Hidden Treasure." This location also includes the mill, dwellings, etc., belonging to the Indian Valley mine. All such moves as these bode evil as far as the operation of the Indian Valley mine is concerned. The practical result will probably be to involve the mine in litigation, which has been the great evil of too many enterprises of this section. The Indian Valley mine is fully equipped for operation, and it is too bad that it should be tied up with legal entanglements.

San Bernardino.

CALICO.—Print, May 14: The chlorides on the Bismarck, Oriental, Thunderer, Pinto, Veto, Blackfoot, and a number of other claims, are doing well on an average, but few making less than \$4 a day to the man and some clearing \$20 or \$30. Jas. Harper's force of men on the Iron Clad are doing considerable work blasting and sinking, with indications of being amply rewarded for their labor. Taft & Knapp have struck a good pay streak in the Little Waterman in West Calico, after having done considerable deadwork in order to reach the ledge. The ore is of a fine grade and appears to be in paying quantities. The leaching works of Lefurgey & Co. and Reed & Co. are reducing ore to their full capacity, netting their owners fair profits. The Waterloo continues to show up extensive bodies of rich ore on the average, occasionally pockets being discovered of a very high grade. The mine keeps 15 stamps busy night and day, and as soon as the new mill is completed, it will keep 15 or 20 more stamps in constant operation and require a large force of men to develop the mine. The Silver Odessa employs its usual number of men, and keeps the company's 15-stamp mill in almost constant operation, netting several thousand dollars every week. The mine is being systematically developed, and shows ore at a depth of 200 feet. Prospecting below that depth will be commenced when the ore is exhausted above it. Barber's force of men on the Total Wreck group of mines is doing some efficient work, and while prospecting for large bodies of ore have taken out a few tons of ore that have given good returns at the mill. Mr. Barber is pushing operations as rapidly as possible, so as to lose no time in finding out whether it will pay to erect a smelter in the vicinity of his mines. It is the opinion of some experienced miners that the mines in West Calico will prove more extensive and lasting than any others in the district. There are about 75 men working in the Garfield group of mines, a majority of whom are prospecting and opening up new bodies of ore, while the rest keep the company's 15-stamp mill supplied with ore sufficient to keep it in constant operation. Most of the ore is taken above the 200-foot level, and there seems to be enough in sight to keep the present mill running for several years. Judging from present indications the output from this group will run up in the millions before the mines will show any signs of exhaustion.

San Diego.

JULIAN DISTRICT.—Julian Sentinel, May 13: The Strong & Blue Jay is getting out about eight tons of fine-looking ore every day. It assays from \$30 to \$35 per ton. It is located just at the edge of town. J. R. Farrell arrived here this week, and entered upon his duties as superintendent of the Owens mine. Mr. Farrell held this same position here about a year ago, and the miners were all glad of his return.

Shasta.

BULLYCHOOP.—Cor. Index, May 14: The Cumberland Mining Co. has struck a bonanza just south of and adjoining their shaft on the True Auger ledge. In making a cut they struck a vein of white quartz very rich in free gold, and about 30 inches wide, and one can't pick up a piece of the quartz in which gold cannot be seen. I am sure it will work from \$50 to \$60 per ton. They have sunk down about 12 feet, and it is holding full as good or better as they go down.

GOOD YIELD.—Shasta Courier, May 14: The Johnson and Tom Greene mine, a mile and a half north of town, and on which a cannon-ball mill is run by steam power, is turning out splendidly. The ledge is well defined, and yields \$280 to the ton. Doctor Ed Reese was off his base when he sold that Aftermath two years ago for \$150.

PROSPECTING for quartz ledges near town is on the increase. During the past few weeks many valuable ledges have been discovered within a mile or two of town; one by Bell, Hopping, and Hammond, just south of town; and Dunn brothers, in Rock Creek valley; and Johnson & Co., near the hospital. All of these discoveries show free gold, and are said to be rich.

MORE OF IT.—Hammond, last week, broke through the back of a horse which he encountered in his mine on the hill this side of Lower Springs, and two miles from Shasta, and just struck it too everlasting rich. The ledge is traceable by surface croppings a distance of 80 yards, and at the depth of 20 feet shows a well-united ledge of seven feet in width. Yesterday, Thomas Greene showed us the result of an assay from rock from this discovery which showed a test of \$850 to the ton.

Sierra.

CLEANUP.—Sierra Tribune, May 14: A cleanup of between \$9000 and \$10,000 was made at the Cleveland mine last Monday. This is the biggest yield the mine ever made, and it speaks volumes as to the value of the property.

HOWLAND FLAT.—Mountain Messenger, May 14: Lincoln Co. at Howland Flat has good prospects, and will do well in their drift claim this year. Virginia Co. is vigorously pushing their tunnel through bedrock, and expects soon to reach the gold lead, believed to extend toward Mt. Fillmore.

Trinity.

NEW ENTERPRISE.—Journal, May 14: Wm. Fowler has been appointed supt. of the company formed for running a tunnel through the point opposite

French creek on the Trinity river, to divert the course of the river and then work the exposed bed. From him we gather the following particulars: Work will begin shortly on the operation, as Mr. John Bamber, who has taken the contract for digging the tunnel, arrived in town Monday and proceeded at once to his destination. He took with him about 1200 pounds of tools and material, the rest being already shipped. The tunnel will be 404.7 ft. in length, the open cut at the inlet will be 75 ft. in length, and at the outlet 178 ft.; the said tunnel to conform to the survey made by W. S. Lowden last fall, and to be 16 ft. wide and 6 ft. high and perfectly straight from inlet to outlet. According to the terms of the contract, the tunnel and open cuts must be completed by Jan. 1, 1888; allowance will be made, however, for any unexpected or unusual "raise" of the river that will prevent work being carried on. It is thought that about 20 men will be employed and the enterprise will undoubtedly be of considerable benefit to that section of the county.

A NEW QUARTZ-MILL.—From Mr. L. Caster we obtain the following particulars in regard to the new mill recently erected on the Venicia mine: The building is a substantial frame structure 64 ft. by 40 ft., 40 ft. high, and has a sheet-iron roof. The mill is a five-foot Huntington, with a 15-horse power engine; it has four Frue concentrators and a rock-breaker, and has a capacity of 15 tons every 24 hours. With the exception of the concentrators, all of the machinery is of the latest improved F. A. Huntington's.

Tuolumne.

THE HYDE MINE.—Union Democrat, May 13: It is reported on good authority that the Hyde mine has been sold, together with the ranch inclosing it, to an association of gentlemen in Alameda county—Messrs. Greene, Reynolds and others—and that the agreement of sale provides that work shall be started on the mine at an early day. Tuolumne county is feeling the revival in mining matters as well as other mining counties of the State, and justly so, for her mines stand on merit, as the records of the past show. Senator J. P. Jones, Mr. Alvinza Hayward and other experienced gentlemen of large means have lately invested in her mines, and the investments are not for speculation but for development and work, and legitimate profits.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Alta, May 18: One-half of the force of miners is still employed repairing the Chollar incline above the 1300-foot level. On the 1200 level the north drift has been advanced 35 feet, and has been connected with the shaft of the Savage mine, at its old ninth station. The west crosscut No. 3 on this level has been extended and timbered 25 feet in favorable vein material. East crosscut No. 1 on the fifth station level was advanced 30 feet.

SAVAGE.—The upraise from the 600-foot level in the ore body has been completed to the 50-foot level, and the ore shoot finished to that level. The winze below the 600-foot level was sunk and timbered 10 feet, and its depth is now 95 feet below that level. On the 800-foot level, one, east crosscut from the main south drift has been advanced 20 feet, its length now being 134. The upraise in the quartz body from this level was extended 14 feet. On the 1200-foot level the north drift was advanced 35 feet, and connections made with the ninth station of the shaft. No. 3 west crosscut on this level was continued 24 feet, and its length is now 191 feet.

Antelope District.

VALUABLE MINES DEEDED.—Eureka Sentinel, May 14: Deeds to the following-named mining properties were yesterday recorded in the recorder's office of this county: William and Katie Whalen to the St. Peter's Con. Gold and Silver Min. Co., Chicago. The St. Peter's mine, the Goddess of Liberty mine, the St. Patrick mine, and the Greyhound mine. Consideration, \$1,000,000 each, or the sum total of \$5,000,000. The mines are in this county.

Bernice District.

SILVER.—Cor. Reno Journal, May 12: The silver mines of Bernice, owned by Mr. Williams, have again been started up, and a new improved 10-stamp mill erected with furnaces and other machinery necessary for the reduction of his ores. This will stimulate mining, and many new discoveries will be opened out, and either reduced upon the mine or shipped to Reno. It has been a conundrum for the past year why the Nickel and Cobalt properties, situated in Cottonwood canyon, owned by the National Nickel Co., have not been started up; but we are now assured by Mr. Talmadge, who has just examined the property, that operations will be started during the present month and that a complete plant will be put up for the reduction of 40 tons per day.

Eureka District.

THE BULLY BOY.—Sentinel, May 14: This is one of the early-day locations of the district, now being worked under lease by Spence & Company. It had lain idle for years, until Mr. Spence, who thought he knew something about it, took a lease and went to work on it. He has made one good shipment of ore, and lately the mine has been improving, so that it has become necessary to build a road to get the ore out. The road being completed, Mr. Spence will commence shipping ore in a few days. The mine was formerly owned by George McCullough, but is now the property of A. Jackson.

THE SILVER LICK.—Sentinel, May 12: The Silver Lick mine, on Adams Hill, under the able management of Supt. A. B. Davis, is looking well at present, and has lately shown signs of improvement of a most substantial character. The yield of ore is increasing, and the value of it is rather exceptional for richness as compared with the ores of most of the other mines of the district. The Silver Lick has been a steady producer for a number of years.

ORE SHIPMENTS.—Sentinel, May 15: During the past week ore shipments were made from the mines of the district to the Richmond Works—Silver Lick mine, 22 tons; Williamsburg, 5 tons; White Pine, 7 tons; Hamburg, 45 tons; Members, 32 tons; Marguerite, 7 tons; Dunderberg, 49 tons; Eureka Star, 1 ton; Silver State, 1 ton; Diamond, 5 tons; Alexandria, 11 tons; Adelphi, 6 tons. Eureka Con.—Alexandria mine, 14½ tons; Woodchopper,

22½ tons; Diamond, 20 tons; Harris, 2 tons; General Lee, 4½ tons.

Marble Falls District.

TO RESUME.—Belmont *Courier*, May 14: It is said that work will soon be resumed on some of the mining claims at Marble Falls in the western portion of Nye county. The ore carries gold and silver, and we are informed that it is the intention of the owners to thoroughly prospect their claims this year.

Marietta District.

ORE SHIPMENTS.—Esmeralda *News*, May 13: M. M. Constock has five men at work on the Champion mine, and will ship ten tons of ore therefrom to the Selby Reduction Works about the 1st of next month. He expects the ore to net \$700 per ton. J. C. Meining has a few men working on the Black Giant; the ore is rich. He will make a shipment of ten tons of ore to the Selby Works to-morrow. There are several men chloriding who are extracting small batches of ore.

Northumberland District.

YIELDING.—Belmont *Courier*, May 14: Mining is progressing finely in Northumberland, and the mines continue to yield the usual quantity of rich ore.

Ophir Canyon District.

ORE.—Belmont *Courier*, May 14: Everything is running finely in the Chicago M. & R. Co.'s mine in Ophir canyon. The ore bodies recently discovered in the 120 soil level and in the 4th level, 240 feet from the surface, are proving very rich and extensive. Ore, in large quantities, is being hoisted to the surface and hauled to the mill for reduction. The mill will soon be running again.

Philadelphia District.

SALE.—Belmont *Courier*, May 14: On May 5, 1887, the Belmont Mining Co. transferred all its mining property and all real and personal property to Ferdinand Reis, of S. F., Cal., consisting of mines and mining claims, hoisting works, dumps, tools, assay scales, office fixtures, furniture, etc., half interest in Monitor-Belmont, 20-stamp quartz-mill, water rights, blacksmith shop, office building, etc.

Pine Grove District.

YIELDING GOOD ORE.—Esmeralda *News*, May 13: The mines at Pine Grove are yielding considerable good ore, and are attracting the attention of capitalists. They are now being worked by the tributaries, who are making money. It speaks well for a camp when poor men are willing to devote their labor and take chances, but thus far the miners have made, in many instances, triple the amount of daily wages and have made the properties worked a source of considerable income to their owners.

Reveille District.

FURNACE.—Belmont *Courier*, May 14: Archer Moore is building a furnace in Reveille for George E. Clarke. Norris Bros. are taking out very rich ore, and will soon start up the Gila mill.

San Antonio District.

PROSPECTING.—Belmont *Courier*, May 14: Prospecting is progressing satisfactorily in the mines of San Antonio.

Spanish Belt District.

ORE SHIPMENT.—Belmont *Courier*, May 14: Another large load of rich ore from the Barcelona mine, at Spanish Belt, was shipped last Sunday to Salt Lake for reduction. Work is pushed with energy, and it is the intention of the present management to develop the property into a first-class mine.

Tuscarora District.

NORTH BELLE ISLE.—Times-Review, May 15: North gangway from the south incline has been advanced 20 feet; the formation remains the same. Everything in and about the mine is progressing well.

BELLE ISLE.—The line crosscut on the 150-foot level has been advanced four feet, north drift from the same has been extended seven feet; the face shows better breaking ground.

NAVAJO.—The south drift on the west vein 150-foot level has been advanced nine feet. South drift from the Johnson crosscut has been advanced seven feet. Fair progress has been made with the work on the 350-foot level.

NEVADA QUEEN.—The machinery was started Sunday; water has all been taken out, and sinking resumed in the shaft. North gangway has been extended 46 feet; 70-foot level has been advanced 12 feet; slight seepage of water in the face. Lumber for shaft-house will be here next week.

Tybo District.

AT WORK.—Cor. Belmont *Courier*, May 14: Mr. Dimick has now out nearly, if not quite, 300 tons, and expects to increase that amount largely before the mill is ready to commence its reduction. A recent visit to his mine showed stopes of fine ore where eight men could readily be employed, and upon the completion of the air-shaft, which is now nearly through, and all the way in ore, several more could be put to work to good advantage, when the output should amount to about 10 tons per day. Mr. Trowbridge has now in his ore bins at the mine 375 tons of low-grade ore, and nearly as much more awaiting removal from the mine. When the mill starts it is expected that there will be no stoppage for at least 40 days, and present prospects point to the second run of as many days before the summer is ended. Immediately after the run of the mill Mr. Trowbridge proposes to commence taking the water from the 2-G mine, and will push the work to the utmost, as it is his intention to prospect the lower levels and prove the value of this famous mine before the snow flies again.

Wild Rose District.

PARADISE VALLEY.—Silver State, May 11: For week milling ore produced and delivered to the mill, Paradise mine, 65,920 pounds; Wild Goose mine, 52,750; total, 59 tons, 670 pounds. Average assay value, per ton, 34.34 ounces silver; 0.19 ounces gold. Mill run 168 hours and reduced 84 tons ore and 59 tons blanket sweepings. Concentrates produced 485 sacks, 34,486 pounds, par value \$6166.61, which was shipped to the Reno Smelting, Milling and Reduction Works, Reno, Nevada. Mill work—Three Huntington centrifugal roller-mills; six Triumph concentrators. Number of men on payroll, 107. Have commenced to sink engine shaft again, and will go 100 feet deeper and open No. 4 or 400-foot level. Had considerable trouble in get-

ting men on the start, but now have on the work our old miners, who sunk the shaft from the beginning, and we will hereafter show good progress in sinking. The west side of the shaft in the bottom shows a well-defined wall. The south drift, 200-foot level, shows strong indications of the near approach to ore.

ARIZONA.

MOHAVE MINES.—*Miner*, May 14: The 700-foot tunnel on the Intallible mine at Stockton Hill has recently been cleaned out and retimbered by Messrs. Southwick and Hatch, preparatory to further developing the mine. On the celebrated Lone Star mine at Mineral Park, which is now being worked by Addison & Co. under a lease, the lessees have a fine streak of ore varying in width from six to eight inches. Oliver Bros. are running in a new tunnel from the bottom of the wash on the Prosperity mine at Todd Basin. On the Rural, at Mineral Park, work is still being carried on as vigorously as possible. Water is now coming in so fast that three shifts of two men each can hardly keep it below the platform. A Baker mining hoist will be placed in position in a few days, after which more men will be put on. A carload of ore will be ready for shipment in a few days, which is expected to average from \$200 to \$1500 per ton. On the Rough Ashler claim, Todd Basin, the lessees are taking out a very good grade of gold ore and plenty of it. Jones and Murphy, who recently purchased the southeast extension of the wonderful Christie mine, at Mineral Park, have struck a two-inch streak of ore assaying from \$1800 to \$2000, and being almost identical with the ore from the Christie mine. Messrs. Brandon and Fogarty are hard at work on the Primrose mine, Todd Basin, and are taking out lots of ore, some of which assays as high as \$800. The transfer of the Signal mine and mill by Hugo Richards and others to the new company has been completed, the consideration being in the neighborhood of \$65,000. Beecher & Co.'s 10-mule team leaves Kingman to-day for the Lost Basin with 8000 pounds of lime and other supplies for the Golden Gate M. & M. Co. John Burt had a couple of tons of ore from the Congress mine, Cedar district, worked during the week. Louis Davidson brought over a couple of tons of the well-known Baden-Baden ore. The C. O. D. mine sent down two carloads this week instead of one, by way of a change. Tom McMahon, who has a lease on the Prince George mine, brought down five tons of ore last week, which went away up. Brown & Roe brought in a couple of tons of fine ore from a claim at Lorena flat below Stockton Hill. Hussey & Co. sent over 12 tons from the Minnesota mine, near Mineral Park, which went about \$500 per ton.

MINING SALE.—Mojave *Miner*, May 7: We learn from Judge Murphy, one of the owners, that the Flores group of mines has been sold. These mines are near Cerbat, and about 12 miles from Kingman, and are named the Flores, Idaho, Vanderbilt and Eureka claims, and are owned by W. C. Parsons, the well-known Tombstone capitalist, in connection with Messrs. E. F. Thompson, Henry Raymond and Judge Murphy, who realize \$60,000 from the sale. The purchasers of this valuable group of mines are New York, Maryland and Pennsylvania capitalists, who propose to expend \$100,000 on the mines immediately. A mill of 20 stamps, with capacity for 40 or 60 more in the future, is to be erected at once on the Flores, where the company owns a fine spring of water, which, with a little improving, will furnish abundance of water for milling purposes. All of these mines have been sufficiently developed to expose large bodies of ore showing free gold, which will mill from \$20 to \$60 per ton and upward.

NOTES.—Prescott *Courier*, May 14: The large pump which Capt. Eagan sent out from San Francisco is being hauled to the Peck mine, and will soon be engaged in drying the property. Miners feel certain that, when dried, the mine and its sister, the Occident, will produce thousands of tons of rich ore. Frank Ryland and his partner have been astraining gold rock from the Southern Belle mine. Rock paid them well. Mr. Jones, of Groom Creek district, is working hard, getting the Azlan mill in condition to crush ore. He will test his mines and then add such machinery as may be required to save the gold. Capt. Brann and Mr. N. Ellis went to Turkey Creek district yesterday. Mr. Ellis may purchase a mill for his Squaw creek mine. John Quinlan and C. P. Fitzgerald are crosscutting what they call the God and Hammer ledge, in Turkey Creek district. Ledge is 2½ feet thick, and assays from \$280 to \$500 a ton in silver. Mr. Quinlan tells us that rich ore is being taken out of the Roach mine. Mr. J. L. Fisher examined mines in Cherry Creek district recently, and believes that they are as good as any he has ever seen. Mines of Centennial district, Yuma county, are attracting attention. They are rich in gold.

COLORADO.

SILVERTON NOTES.—*Miner*, May 14: The Oriental is to be extensively worked this season. The Caribou mine at Ophir has about 500 tons of ore on the dump, awaiting shipment. A great deal of interest seems to be concentrating on the Cement creek region, and we look for a large amount of development work in that direction. A small force of three men are working Perry Fisher's property on the south fork of Cement creek. Some very rich gold quartz was extracted last year. The North Star and Yellow Jacket, two of King Solomon mountain's richest mines, will ship to Silverton not less than 4000 tons of high-grade ore this year. Mr. Riggs, of the Indiana and Kentucky mines, in Gray Copper Falls gulch, reports the mines looking first-rate. He will soon begin to ship. Wyman & Co. have contracted with Thompson & Klein, lessees of the Belcher mine, for the packing of 1500 tons of ore this season. The Montezuma and Terrible mines, at Ophir, have several hundred tons of ore out, which will be sent over the range to Silverton in a few days, or as soon as the trail will be open for pack animals. The Great Eastern will be an important shipper of ore this season. The ore already on the dump amounts to hundreds of tons, which is scarcely a marker compared with that in sight in the mine. Charley Handy will start the Red Cloud stamp-mill in Swamp canyon, near Ophir, at once, on a trial run. Twenty-five tons of the gold quartz will be run through, and if the test proves satisfac-

tory, another mill of the same manufacture will be erected at a more convenient point.

IDAHO.

SALE OF THE JARVIS.—*Challis Messenger*, May 12: A. Sargent has sold his one-half interest in the Jarvis claim, near Bayhorse, to C. E. Taylor. Consideration, \$4000. The other half of this property is owned by Jack Adams. This is one of Bayhorse's good properties and only needs sufficient development to make a mine of it. The developments already made prove that it carries a 20-foot vein of white quartz with sufficient galena and silver in it to pay for concentrating almost the entire width from wall to wall, and a small portion of which is high enough in lead and silver to pay well for reducing without concentrating. Besides this immense and continuous body of low-grade ore, the lode carries a vein of from two to eight inches of copper-silver ore, on the hanging-wall, which smelter returns show averages 300 ozs. in silver per ton.

LOWER SALMON.—Fred Phillips has just returned from the Dynamo or Big creek country. At Dynamo there are 47 men employed in and around the company's mines; and it is generally thought there that this year will be a productive one among the placers. The two 10-stamp mills—one on the Kentucky mine and the other on the Grunter—are doing very well. Each one is crushing its usual amount of good ore; and it is particularly pleasing to hear that both mines are holding their richness and increasing in size as they are zoned down upon. As far as Mr. Phillips could see of all this lower country, it is gaining in importance of mineral production every day.

AT WAGONTOWN.—*Idaho Avalanche*, May 14: The Wilson lode at Wagontown is showing up splendidly, and from every appearance, will prove a genuine bonanza. Work is being pushed as rapidly as possible, and as depth is gained, the lode grows larger and richer. Capt. De Lamar is very sanguine that he will develop a property in the Wilson mine second to none in Idaho. Enough ore is said to be in sight to keep a mill of 100 tons capacity running steadily for two years. As soon as possible a shaft will be commenced at or near the junction of the tunnel with the lode. Miners are being put on as fast as there is room for them.

THE EMERY MINE.—*Inter-Idaho*, May 11: The Emery mine, on Deer creek, is fast developing into a huge ore-producer. Yesterday a specimen chunk of ore was brought down to Hailey, which weighs 540 pounds and is exceedingly rich in silver. They have a large amount of similar ore on the dump ready for shipment, and a gentleman who visited the works informs us that there is now in sight in the mine at least 200 tons of ore which will go 100 ounces silver to the ton. J. W. Burns and Ed. Flannery are the principal owners.

STRIKE IN THE CAMAS NOS. 2.—Wood River *Times*, May 11: Pieces of ore from the new strike in the bottom of the Camas Nos. 2 shaft, a couple of days ago, were shown around town to-day. They show iron pyrites, red and brown oxide of copper, and some free gold. It is very good and very rich ore—although not even a fire assay could determine its yield under stamps.

MONTANA.

NEIGHBORING MINES.—*Anaconda Review*, May 14: The event this week in mining business has been the strike in the Katie Darling. This mine is located on Carbonate hill, and is the next claim but one to the Blue-Eyed Nellie. It has always been considered a very promising mine. The shaft is now down to a depth of 65 feet, and has been worked by three men up to this time. Near the top some very rich ore was taken out, but lower down the rock did not seem so rich. On Monday they were drifting from the 65-foot level, and had gone only ten feet when they struck a very rich body of ore, which seems to be of large extent. Samples of the ore were brought into our office yesterday, and it would be hard to distinguish them from the Blue-Eyed Nellie rock. The mine is owned by D. Shovelin, J. Burns, Dent McGowan and John Monigal. They intend to put on a large force of men right away, and develop the property to its full extent. As soon as a sufficient quantity of ore can be taken out it will be shipped for treatment, and then an accurate estimate of the value of the mine can be formed. There can be no doubt that the Katie Darling is a very valuable mine. There is a general impression that a silver-mill will be put up on Carbonate hill this season, and that it will be built by parties who have money. The snow still hinders mining operations west of Anaconda, but a number of prospectors are busy notwithstanding.

WAGONTOWN MINES.—*Silver City Avalanche*, May 7: The Wagontown mines were discovered in 1875, when considerable work was done in developing them on the surface, and to depths not exceeding 75 feet. The consequence was that the camp lay comparatively idle for several years, and not until Captain J. R. De Lamar purchased the Wilson lode were the mines worked on a systematic scale, with a view of proving their value at considerable depths. The late developments in the Wilson mine prove it to be one of the best properties in Idaho Territory, not by reason of the richness of ore, but because it has been proven to contain large quantities of low-grade gold ore. The second lode has been cut at a depth of nearly 300 feet from the surface, where the ledge averages 12 feet wide, of ore that will pay handsomely, if milled at Wagontown. The manager of the mine, Captain De Lamar, informs us that he can now figure 30,000 tons of ore in sight. The ditch to convey water to the mill, to be erected, was commenced last fall, and will soon be completed at several thousand dollars expense.

THE LOWER WORKS.—*Anaconda Review*, May 14: A representative of the *Review* went down to the lower works this week to see what was going on there. A force of 50 or 75 men is now at work taking the machinery from the track up into the immense building. The machinery is constantly coming in and is being put in position as fast as it arrives. All the machinery that has come so far is for the 60-stamp silver-mill, and at the present rate of shipment the mill will be in operation before very long. The boarding-house is running at the lower works, and is presided over by I. Sparey. No one could give any definite idea of how soon the mill would be ready for operation, but the prevailing opinion is that it will only be a few weeks more until it is working.

GRANITE MOUNTAIN PRODUCTS.—*New Northwest*, May 13: We have it from direct sources that the bullion shipments from the Granite Mountain mine, for the month of April, 1887, amounted to 290,000 ounces (a little less than that number of dollars), which is a very good yield—at the rate of over three and a quarter millions for the year. The mine and mills and all machinery connected therewith are working smoothly. "Matters about Granite are bright, and everything points to a prosperous season for mining throughout Flint Creek district generally."

MURRAY.—*Butte Miner*, May 14: Mr. R. G. Huston, who has recently returned to Butte from an extended business trip, was yesterday speaking of some of the points he had visited, and among others named Murray, Idaho, as a place of great possibilities. "Whenever facilities are developed for working the Old Wash," he said, "it yields handsome results, and capital will no doubt take hold of the upper ditch at some time and finish it to the higher bars. Below Murray they are still working the placers in Buckskin, Missoula, and Dream gulches. These, of course, do not furnish employment to many men. Just at the time I visited the camp all the quartz-mills were shut down but three. All anticipated starting up soon. The far-famed Mother Lode, Treasure Box and Occident were all running their armstas and were doing well. The Treasure Box is one in reality, as the owners pounded out with a hand mortar this winter nearly \$15,000—good enough without a mill. The curse of this country has been the litigation carried on. Every property is or has been claimed by two or three different parties, and thus they get wrapped in an endless lawsuit. I think this thing of men going into a mining camp and locating for all their sisters, cousins and aunts is not just the thing to preserve good order and feeling among the pioneers. Frank Reed's Buckeye Boy, in Dream gulch, is an exception to the general rule. No one seems to be at law with him for a share of his good fortune. He has some of the finest ore in the camp; keeps up his grub stake, he says, by pounding it out in a mortar. He has done a large amount of work on his mine, and will show it up to some man's satisfaction at an early day."

NEW MEXICO.

FLORENCE.—*Scotts Bullion*, May 12: The Florence Mining Co. has commenced work on their properties in the Water canyon, they having secured the Jane Bowman and Texas Ranger, two as promising prospects as are now to be seen in that noted district. Mr. Boswell, of St. Louis, and a member of the company, arrived Thursday, and will put a large force of men at work immediately. Mr. John Bailey came in last week and placed before us some fine specimens of argentiferous gray copper ore from his Hop canyon group of mines, which he owns with Frank Ryan. It runs 25 ounces silver, 20 per cent copper and one-half gold. The ore body from which it is drawn is 12 inches in width. These gentlemen have invested \$2000 in work and will continue to develop until the property is in a shape to produce economically.

OREGON.

SILVER CREEK.—*Bedrock Democrat*, May 12: The recent bonding of the Cabel Bros.' group of mines, and Graham & Co.'s Golden Monarch mine, in the Silver Creek mining district, by gentlemen representing Eastern capital, lifts, in a great measure, the obscure cloud that has enshrouded the district in the past. That the mineral deposits of the Silver Creek country are rich and extensive, there can be no longer a question. A visit to the section will allay any misgivings had regarding them. The deposits show for themselves, and the extent of development work done is sufficient to assure a correct estimation of their value. We predict a boom for this mining district, and that, too, before many days. Scores of Eastern mining men have been advised of the richness of the camp, and many of them are turning their attention in this direction.

UTAH.

REVIEW.—*Salt Lake Tribune*, May 13: The receipts in this city for the week ending May 11th, inclusive, were \$109,804.82, of which \$60,250 was ore and \$49,554.82 was bullion. For the week previous the receipts were \$53,900 in ore and \$9,925.81 in bullion, a total of \$103,825.81. The output of the Ontario for the week was 39 bars of bullion, 23,112.67 fine ounces, and \$19,423.58 ore sales, a total, approximately, of \$42,536.25. The daily product for the week was six bars of bullion, 838.85 fine ounces, and \$14,835.33 ore sales, an approximate total of \$23,674.18. Fine bar receipts of the week were to the value of \$13,019.82; base bullion, \$8300. The Hanauer smelter product of the week was \$18,585 worth of bullion. The Horn Silver is shipping some cars of ore occasionally—enough, as understood, to pay expenses, but neither the value of the ore nor the expense account is allowed publicly. Ore receipts in this city for the week were \$16,150 by Wells, Fargo & Co., and \$44,100 by McCormick & Co., including \$7700 Crescent.

PARK NOTES.—*Record*, May 14: Ere long when the new machinery is in working order, nearly double the present force of miners and timbermen can be employed to advantage in the Daly shalts, drifts and stopes. The Crescent is advertising to sell on contract its mine and concentrator product for the next year. The rest of the Crescent machinery, which is being supplied by the Utah & Montana Machinery Company, is expected daily. A large No. 7 Burleigh air compressor, of 60,000 pounds, has been ordered for the Daly. Pipes are being laid at the Ontario, preparatory to washing away the dump as is done every spring. The Crescent concentrator and tramway are running full blast. Machine shops are soon to be erected at the Anchor. During the week the Crescent shipped 422,825 pounds of first-class ore and 120,725 pounds of concentrates. For the week just ended the Mackintosh sampler received 616,850 pounds of Ontario, and 25,050 pounds of Daly ore. The Ontario bullion product for the week was 39 bars shipped on the 9th, containing 20,801 fine ounces of silver. The Marsac mill turned out last Monday six bars of Daly bullion, 6963 fine silver ounces, and this morning seven silver bars containing 8269 fine ounces were shipped.

"CHALLENGE" IMPROVED ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
 W. G. ROBERTS, Greenwood, El Dorado Co., Cal. J. R. TREGLOAN, Supt. South Spring Gold Mining Co., Amador City, Cal.

And many others, and we are prepared to furnish either the

"CHALLENGE," "STANFORD," "TULLOCK," or "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and copies of Testimonial Letters, and will quote prices upon application.

THE FRISBEE-LUCOP MILL,**A CENTRIFUGAL ROLLER MILL**

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

THE FRISBEE-LUCOP MILL CO.,Office, 145 Broadway, cor. Liberty St., NEW YORK,
HOOKER & LAWRENCE, Gen'l Agents.**THE ROLLER ORE FEEDER**

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

SPAULDING'S

Inserted Tooth

AND

CHISEL BIT

CIRCULAR

Saws.

SAW MILLS AND MACHINERY
Of all kinds made to order. Send for Descriptive Catalogue. 17 and 19 Fremont St., San Francisco.

LOCOMOTIVE FOR SALE.

Gauge, 20 inches; height, 5 feet 6 inches; width, 4 feet; weight (fully watered and coaled), 8 tons. Also one extra set wheels, tools, 30-pound iron rails, etc.

Apply to

BALD MOUNTAIN MINING CO.,

Forest City, Sierra Co., Cal.

Or to 320 Sansome Street, San Francisco, Room 24.

GOLD MINERS

Working

Quartz, Gravel and Placer Mines!

—MY—

Silver-Plated AMALGAMATING PLATES

HAVE PROVED THE MOST ECONOMICAL AND SUCCESSFUL PROCESS KNOWN FOR SAVING GOLD.

Over 3000 Orders Filled.

Fifteen Medals Awarded.

Old Mining Plates Bought, Replated, or Gold Separated.

These Plates can also be purchased of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine Street.

San Francisco Gold, Silver & Nickel Plating Works,

653 and 655 MISSION ST., SAN FRANCISCO, CAL.

E. G. DENNISTON, Proprietor.

SEND FOR CIRCULAR.

NOTICE.—My Silver-Plated Plates are well known and used everywhere. They have proved superior to all others in durability and weight of Silver.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,

Springfield, Ohio,

or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents,
Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

DR. PIERCE'S ELECTRIC BELT
Only Perfect Body Battery ever invented. Gives an Electric Current without the use of ACOIDS. ELECTRIC SUSPENSORY. Estab. 1875. Send for FREE with every Belt. Free Pamphlet No. 2. Address, MACNETIC ELASTIC TRUSS CO., 304 NORTH SIXTH STREET, ST. LOUIS, MO. 704 BAYMONT ST., SAN FRANCISCO, CAL.

San Francisco Cordage Factory.
Established 1856.

Constantly on hand a full assortment of Manila Ropes, Sisal Ropes, Tarred Manila Ropes, Hay Ropes, Whal Line, etc., etc.

Extra sizes and lengths made to order on short notice. TUBBS & CO.
611 and 613 Front St., San Francisco

DEWEY & CO.'S SCIENTIFIC PRESS PATENT
Labeled and most successful on the Pacific Coast. No. 220 Market St. Elevator 12 Front St., S. F.

THOMAS PRICE'S ASSAY OFFICE,
CHEMICAL LABORATORY,
BULLION ROOMS and ORE FLOORS,

524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING MAY 10, 1887.

- 362,706.—CURTAIN FIXTURE—Chas. Bell, Tacoma, W. T.
- 362,919.—ADJUSTABLE STOVE GRATE—H. W. Bodeman, S. F.
- 362,489.—HOISTING MACHINE—T. A. Byler, S. F.
- 362,736.—FRUIT-DRIER—G. A. & C. F. Fleming, San Jose, Cal.

- 362,861.—RAILWAY RAIL-JOINT FASTENING—W. L. Van Harlingen, S. F.
- 362,809.—FAUCET HOLE AND STOPPER—W. L. Woodley, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court Department to, San Francisco:

GRENOBLE M. Co., May 14. Capital stock, \$400,000. Directors—W. B. Murdoch, F. E. Jewell, D. B. Arthur, E. Marten Smith, John Henderson.

ANACONDA M. Co., May 14. Object, to do a general mining, banking, commercial, and "also to carry on and transact any and all kinds of business in which natural persons may lawfully engage." Directors—James B. Haggin, Lloyd Tevis, George Hearst, Louis T. Haggin, Joseph T. Clark. Capital stock, \$20,000,000, divided into 200,000 shares.

PACIFIC IRON LATH CO., May 17. Capital stock, \$1,000,000. Directors—Geo. E. Voelkel, Chas. Butler, John Rapp, Edward Schmitt, John Weichart, Henry Ferguson and P. A. Wagner.

Mining Share Market.

During the past week, as our table of prices shows, there has been quite a little boom in stocks. The activity of the market has brought out buyers again, who hope for a continuance of the upward tendency of stocks. From what could be learned the principal reason of the strong market is that the fire in the 1400-foot level of the Con. Virginia has been controlled and virtually extinguished. It was confidently asserted upon the street that the present strength of the mining market would hold good into the summer months, although it will most assuredly have but a short duration if leading operators fail to receive satisfactory assurances of the uncovering of bodies of ore.

Con. California, Virginia and Ophir are the leading favorites for buyers, but several of the principal middle mines also have numerous believers in their value.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Argus, May 14, \$3300; Eureka Con., 14, \$19,414; Hanauer, 17, \$1000; Alice, 14, \$33,326; Bluebird, 14, \$20,480; Moulton, 8, \$15,248; Lexington, 8, \$21,008; Hanauer, 12, \$2100; Bannock, 12, \$2600; Hanauer, 13, \$4880; 14, \$2860; Alice, 15, \$14,332; Hanauer, 15, \$5600. Last week Wells, Fargo & Co. shipped from Salt Lake \$41,409, and McCormick & Co. \$67,335.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARRE C. HOAG—California.
G. W. INGALLS—Arizona.
E. L. RICHARDS—San Diego Co.
A. J. HARE—El Dorado Co.
CHAS. LEST—Alameda Co.
GEO. MCDOWELL—Ventura and Santa Barbara Cos.
J. L. DOYLE—Alameda Co.
W. J. FERMAN—Colusa Co.
SILAS PRUDEN—Colusa Co.
WILLIAM POOL—Fresno Co.
M. S. PRIME—Alameda Co.
R. G. HUNTON—Butte, Montana.
E. P. SMITH—Humboldt Co.
S. J. LITTLEFIELD—San Diego Co.
EDMUND WRIGHT—Shasta Co.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

LOOERS, says the Coos Bay News, have exhausted their vocabulary of choice words in commenting on the late winter weather. Work in the woods is at a standstill.

JAMES FINLEY, one of the owners of the Harshaw mine, Arizona, is in this city having a ten-stamp mill built.

FOREST FIRES have been raging disastrously on Cape Cod and in the northern Michigan peninsula.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

New York Metal Market.

Telegraphic advices dated May 18th give the following New York prices:

BAR SILVER—95c per oz.	
BORAX—\$1.04 1/2.	
COPPER-LAKE, \$10.40.	
IRON—No. 1, \$22.00.	
LEAD—\$4.30 @ 4.35.	
QUICKSILVER—\$3.05 @ 3.10.	
The following is the latest by mail from the "New York Metal Exchange Market Report":	
COPPER—Quiet, spot closing at \$9.90 @ 10.00. Transferable Notices (Lake) issued at \$9.60 @ —. Transferable Notices (Chili Bars) issued at \$9.75.	
LEAD—Firm at \$4.45 @ 4.55 spot. Transferable Notices issued at \$4.52.	
TIN—Quiet at \$23.15 @ 23.55. Transferable notices issued at \$23.20.	
Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.	
Australian Tin, \$23.25 @ 23.50; Biliton Tin, \$23.60 @ 23.75; Banca Tin, \$23.85 @ 24.00; Baltimore Copper, \$9.05 @ 9.25; Oxford Copper, \$9.00 @ 9.25; P. C. Copper, \$10.00 @ 10.25; Foreign Lead, \$4.65 @ 4.70; Foreign Spelter, \$4.70 @ 4.75.	
MAKERS' PRICES—At tidewater. 100-ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$20.00 @ 21.50; No. 2, \$19.50 @ 21.50; Grey Forge, \$17.50 @ 19.00; Hudson River, Grade No. 1, \$21.00 @ 21.50; No. 2, \$20.00 @ 21.00; Grey Forge, \$17.50 @ 19.00; Southern, Grade No. 1, \$21.50 @ 22.00; No. 2, \$21.00 @ —; Grey Forge, — @ —.	

A Popular Stopping Place.

The Winchester house, an advertisement of which appears elsewhere, has, under the efficient management of its present proprietor, Col. John Pooley, fast forced its way into public favor. The house is strictly "temperate"—no liquor being sold on the premises. The proprietor claims to set the best table in the State for the price. The location is most central and could not be better. It is but a half block from the junction of Market, Kearny and Third streets, the three principal streets in the city. Hot and cold baths are free and a free laundry in the house for the use of families. The Winchester house coach is at the depot on the arrival of every train, and carries passengers free to the house. Col. Pooley is an old resident of this State, and well known throughout Nevada, Placer, Santa Clara and other counties of California; also at Virginia City, Pioche, Candelaria and Carson City, Nevada; also Tombstone, Arizona; being interested in mines previous to entering the hotel business some years ago.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

For Sale.

State and County Rights of a Fly Trap; warranted to keep your house free from flies. Send stamp for particulars to Z. Nevers, 203 Brannan St., San Francisco, Cal.

METALLURGIST AND ASSAYER desires a position, either in Mill or Smelter; 16 years' experience; best of reference given. Address J. W. C., 1307 Stockton St., S. F.

Table of Lowest and Highest Sales in S. F. Stock Exchange.

ATTENTION, MILLWRIGHTS!

A BOOK YOU ALL WANT.

Lefel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.

A STANDARD WORK.

This practical work of 233 pages gives with full illustrations and complete details how to build or repair all kinds of mill dams. Plans have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now

1850. 1887
RANKIN, BRAYTON & CO.,
 BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

RAE'S ELECTRIC SYSTEM OF METALLURGY,

Fully Covered by Patents.

THE MOST IMPORTANT DISCOVERY OF MODERN TIMES RELATING TO THE REDUCTION OF ORES.

EFFECTS A SAVING OF OVER 50 PER CENT IN QUICKSILVER, AND LARGELY INCREASES BULLION PRODUCT. CAN BE APPLIED TO THE MACHINERY ORDINARILY USED IN MILLS, AT COMPARATIVELY SMALL EXPENSE, AND WITH BUT LITTLE CHANGE.

FOR FURTHER PARTICULARS APPLY TO OR ADDRESS

PACIFIC IRON WORKS, San Francisco, Cal.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

BROCK'S PATENT DROP FORGED CHAIN PIPE WRENCH

MADE ENTIRELY OF BAR STEEL. Six Sizes; adapted for Pipe from 1/2 to 14 inches diameter.

Each number will fit a range of sizes equal to six or more pairs of common tongs, while it will outwear an equal number of any kind. Jaws are hardened to a saw temper, and can be sharpened with a file. Does not crush pipe; has a quick grip; never slips; chain will not unhitch while in use, but can be instantly released.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction,

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Send for Circulars and Price List.

HOSKIN & CO., Marysville, Cal.

This cut represents our
**IMPROVED
 HYDRAULIC
 MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroad and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

**THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

SAN FRANCISCO, SATURDAY, MAY 28, 1887.

VOLUME LIV
Number 22.

The Cogswell Polytechnic College.

A New Technical School for San Francisco.

A few weeks since we chronicled the fact that Dr. Henry D. Cogswell, of this city, had donated property worth \$1,000,000 to found a technical school where our boys and girls may prepare themselves for the trades and vocations of life. On this page we give the elevation of the main building of this new institute of learning, the plans of which were drawn by Chas. Geddes, the architect. The structure will be of pressed brick with stone trimmings. It is to be located on the lot corner of Folsom and Twenty-sixth streets, with a frontage of 245 feet on the first-named street and 182 feet on the latter.

The building will be three stories high, and from its imposing and substantial appearance will be the most notable structure in the southwestern portion of the city. It will be 71 feet in width by 85 feet in depth, not including the projections. On each side will be a wing two stories in height, each 35x40 feet. The building will be surmounted with a high roof, covered with ornamental metal Queen Anne shingles and have handsome cresting on the ridges. In front a high tower rises to the height of 127 feet, the apex topped with a revolving crystal star set in a copper pinnacle. On the face of the tower, above the third-story line, will be the dial of a clock, and still lower down will be the name of the school. The main entrance is spacious and surrounded with a wide porch. On each side of the door is a niche for the placing of pieces of statuary. There are also two side entrances—one for boys and the other for girls. The main-entrance porch is approached by a broad flight of stone steps. The main hallway is ten feet wide, and opens into a cross-hallway 12 feet wide, which crosses the building from end to end. From the cross-hall, stairways lead to the second story; stairs also lead to the stage at the rear and to the front of the assembly hall, in the story above. It will thus be seen that the means of egress are unusually excellent, there being three wide doorways from the ground story to the street and two from the second story to the assembly hall.

There are to be 10 classrooms, each 28x30 feet, four to be on the main floor and the other six to be in the second story. On the first floor

also will be the offices of the president and secretary, a reception parlor, a library 16x28 feet, and a museum 20x28 feet, besides a number of dressing and toilet-rooms. A spacious assembly hall occupies the entire third story. It is 68x70 feet in size and will have a seating capacity for 1000. It will be used for the delivery of scientific and other lectures in connection with the regular courses of study in the school. This hall is to be handsomely furnished and provided with a stage with all the necessary adjuncts for completeness. All the rooms are

with iron lathes, a drill-press, planers and rollers, by the aid of which pupils will be instructed in the arts of turning, drilling, and planing iron, so that they will be qualified to construct tools and small pieces of machinery. A forging furnace and laboratory will also be established and occupy a space 40x40 feet. The founding laboratory will be 35x40 feet in size, and contain a furnace and other necessary appliances.

The second floor will be devoted to the chemical, wood and physical departments. The carpentry department will be 40x35 feet, and be

the basement will be well-lighted lunchrooms for the boys and girls; also rooms for the janitors and others who will reside permanently on the premises. There is also some additional space which may be utilized for classrooms or shops that may hereafter be required or found desirable. All the departments of machinery will receive motive power from a 75-horse power horizontal engine, which, together with the boilers, will be of the most approved pattern.

In connection with the instruction in the mechanical arts and sciences, a four years' course

of instruction will be given to those pupils who may so desire. The course will include a thorough English education, together with German, Spanish and French. Arithmetic, geometry and algebra will be embraced in the English course, and special attention given to all branches that may in any manner be deemed essential to the many mechanical pursuits. A course will also be given in mechanical and architectural drawing, embracing both freehand and perspective. Business forms, single and double entry bookkeeping, telegraphy, phonography, commercial law and correspondence will also receive special attention. A notable feature of the college will be its recognition of the coming education for the preparation of progressive teachers.

The school will be open to the boys and girls of this city and State who may have completed the third grammar grade in the public schools. Tuition will be absolutely free, the endowment of the college being

of East and visit institutions of a similar nature, study the methods of work, and ascertain just what will be needed in the shape of machinery and scientific appliances to make the school all that it should be, and all that its generous and thoughtful founder wishes to make it.

The cost of the buildings alone will be some \$35,000, and the machinery and tools \$25,000 or \$30,000 more. The school will be under the personal management of James G. Kennedy as president and Mrs. M. E. Arnold vice-president, who have already been engaged to fill those two important positions. Mr. Kennedy supervised all the plans of the building and many details were suggested by him. As soon as the construction of the building is fairly under fully provided for by the donation of its generous founder.

THE COGSWELL POLYTECHNIC COLLEGE, SAN FRANCISCO.

well lighted, and every appliance known to modern skill will be introduced to make ventilation perfect. They are to be lighted with electricity, and electric bells and speaking-tubes will be run throughout the structure.

A short distance in the rear of the main edifice will be another building in which the shops and laboratories are to be fitted up. It will face to the north and be 152 feet in length by 40 feet wide, and two stories in height. The ground floor will be devoted exclusively to iron work, both designing and molding, having departments for filing, fitting and chipping. A laboratory will be established in a room 35x40 feet, and fitted with all the essentials for thorough instruction in polishing, fitting and setting up of various pieces and descriptions of machinery. A machine-tool laboratory will be 40x40 feet in size, and completely equipped

supplied with an extensive assortment of tools. A wood-turning factory will be 40x40 feet, and be supplied with lathes, a planer, a circular-saw, a handsaw, a mortise machine, a molder and several other machines. The remaining space on the floor will be at the disposal of the physical and chemical departments. One room, 20x20 feet in size, will be fitted up with shelving inclosed in a glass front, where all the philosophical apparatus will be kept that is used in experiments in chemistry and physical instruction. The furnaces in connection with this department will be in an adjoining room, 40x50 feet in size.

The department for the instruction of girls will be fully as complete in detail as that for the boys. Here instruction will be given in wood and metal carving, sewing, cutting and fitting, as well as other mechanical studies. In

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Geological Formations.

EDITORS PRESS:—I read with much interest the letter of your correspondent, which appeared in the edition of May 14th, under the head of "Some Remarks on Geological Theories." I do not wish to enter into any "heated discussion" over the matter, but it occurs to me that your correspondent either does not understand or intentionally distorts the teachings of modern geology. He makes several statements which he claims are from geologists or from geological text-books of the present day—the same thing—which statements I doubt he can show in any standard text-book. He says: "Granite is an igneous production—first formed of all the rock—the backbone of the earth. Furthermore, there have been deposited on the granite everywhere a uniform system of aqueous formations (sedimentary, he means) numerous, distinct and identifiable, amounting in the aggregate to an average thickness of about ten miles; therefore, when in any particular region the upper portion of the series, according to their classification, is wanting, in order to maintain their principles, they resort to the expedient of assuming that the missing portions have been removed by denudation."

I am not a professional geologist, but have studied it a little, and must say I never saw any such statements as the above in print before. If such theories are advanced they are certainly not from recognized authority.

In the first place, whether or not granite is a primitive formation underlying all other rocks, I do not know, though such, I believe, is assumed to be the case; but I do know that the lower series of Silurian rocks—the Cambrian overlies unconformably large areas of Archean rocks—not granitic at all, but metamorphic. In the Black Hills of Dakota, the Archean rocks have an enormous thickness, more than 25 miles being exposed, and in no case can the strata be found repeated by folding.

Furthermore, no geologist of any note assumes that there has been deposited everywhere sedimentary formations aggregating a thickness of 10 miles.

It is a well-known fact that the sedimentary formations—particularly the lower members, say from the Cambro-Silurian to the Permian in the United States—thin out coming westward from the Atlantic States to the Rocky mountains. The Devonian, for instance, which has a large development in the State of Pennsylvania, in Iowa is represented by a stratum of 150 feet, while in Dakota and Wyoming it is missing entirely. Is it reasonable or possible that this difference has been caused by denudation?

I think that while it may be possible, it is far from probable, but that the reason is that the land along the base of the Rockies at the time of the Devonian period was not submerged at all, and that the land was continually rising, and as a matter of course this would result in a thinning out of the strata in the States of the Mississippi valley and westward.

Another most convincing proof that at certain geological periods the entire earth's surface was not submerged is the beds of conglomerate which mark the shore lines, showing that the land beyond was an island or a continent in the sea.

As to the determination of the geological age of a rock by the fossils it contains, I think it needless to say anything about it. It is a generally accepted fact the world over, among all geologists. It remains for those who have no faith in it to disprove it.

As to what Darwin says concerning the large denuded (?) granitic area in South America, it must be remembered that at the time Darwin wrote, geology had not reached its present high standing. Personally, I know nothing of the area referred to, but I believe that the rocks are metamorphic and not igneous.

If they are metamorphic they are simply changed sedimentary strata, possibly Archean, perhaps later rocks, and even if they are igneous granite such a denudation may have taken place. The Colorado river in the Grand canyon in Arizona has cut its way down through 10,000 feet of sedimentary strata, and into the crystalline rocks below.

Your correspondent speaks in wonder at finding in temperate latitudes in the quaternary formation the fossil remains of animals from the tropics and the polar regions, and declares that if the denudation of the mountains was caused by immense masses of ice, it would have crushed the fossils to powder.

Rocks, soil, sand and fossils may have been, and doubtless were, transported thousands of miles on ice floes.

I cannot concede that it must have been necessary to submerge the entire earth's surface during the glacial or drift period to have produced the drift.

The internal dynamic forces which have produced the great mountain masses of the earth have been something tremendous, almost beyond the comprehension of man.

It does not seem to me at all improbable that the "see-sawing" actually took place.

W. H. STORMS.

South Pasadena, May 20th.

On Selling Mines.

EDITORS PRESS:—In the PRESS of April 30th is an article entitled "Bad Policy as well as Bad Morality," complaining of the miners in general exaggerating the amount of work done on their claims, picking out the best ore to get big assays from, claiming larger bodies in sight than they can show, etc. All this we are willing to acknowledge, and I humbly suggest as a way out of all the difficulties that usually surround the purchase and sale of a mine, that the miner in the first place stick to the unvarnished truth; that the capitalists hire a reliable, intelligent miner who knows what a good mine looks like, who is not afraid of work and has worked in mines, and can sharpen a pick or drill or put in a set of timbers, and can run a mine and keep a crew of miners at work so as to bring profit to his employer. If after such a man has looked at a mine, he thinks it is to your interest to take hold of the claim, then say to the mine-owner, "You give me a working-bond on your claim at such a price as is agreed upon and I will sink so many feet and drift so much. Then I will take a carload of the ore and have it worked at a good mill by reliable parties who understand their business and can and will give a fair and just return. Then if the ore will pay I will give you the price agreed upon in our bond. If it will not pay, then the mine is yours, with all the improvements made, to do with as you like." This would be fair on both sides. If the miner has a claim that will not pay, he wants to know it, and the sooner the better for him; and the capitalist wants to know, before he goes into the expense of putting up mills, etc., whether he has got a mine, whether there is wood and water—in short, count the cost and find out what the net profit will be. Then there will be success, and we will have no more big graveyards reminding us of our folly and giving the entire country a black eye. Above all things, Mr. Capitalist, do not put yourself into the hands of a white-handed expert who will sell you out to the unprincipled salter of claims, or who, if he cannot get the mine-owner to agree to pay him from \$3000 to \$10,000 in case he works up a sale, will report adversely and work off a worthless claim upon you.

Walker, A. T.

The Pine Creek Mines.

EDITORS PRESS:—This camp is about two years old. The first excitement began about this season of the year. This district is on the headwaters of Pine creek, a tributary of the Snake river, and is in Union county, Oregon, and about 60 miles in an easterly direction from Baker City. We have an abundance of snow here. The snowfall, since it began last fall to the present time, measured between 34 and 35 feet. We have two feet yet on the ground. Business is very dull, but we look for lively times in the near future. The Whitman mine, owned by the Oregon Gold Mining Company of Louisville, Ky., has the deepest works in the camp, their shaft being down over 300 feet, with a four-foot ledge in the bottom that is all good ore. The company has bought a mill of 20-stamp capacity, and will build as soon as the roads get in condition to haul heavy freight. They have a small force of men at work grading their mill-site.

We have several locations here that prospect very well. The Red Jacket claim, owned by Messrs. Duffey, Burdett & Tice, has showed itself to be remarkably rich. They shipped one carload of ore last fall that netted them over \$1000. There are also the Red Boy, Union, Robert Emmet, Last Chance, Companion, Cox and Allen, Forest Queen, Mayflower, and many others too numerous to mention. All these prospect well. The fact is, all this camp wants to make it one of the best on the coast is redaction works. Some good custom-mills would make things lively here winter and summer. Living is cheap, as we are close to a rich farming country. Timber for mining and building is plentiful. There is everything to make a good camp here except the redaction works.

Cornucopia, Oregon, May 15. S. K. S.

Exaggeration of Mines.

EDITORS PRESS:—Your recent article on exaggeration of mines by their owners is certainly timely.

Last January, after a ride of 60 miles over the desert, with men, tools and provisions (in your State), we found nothing whatever to justify the statements of a mine-owner and mining engineer(?). After a loss of about three weeks' time, and an expenditure of about \$500, we found out what could as well have been told us at once.

The Eastern party left, thoroughly disgusted with California mining, thinking he would be swindled by some one if he kept on. The one examining is also sure to think that whoever will lie this way would not stop at that, but if assays run high is afraid it is salted. Such a course is a great injury to your mining interests, as this party would have invested largely with a half decent treatment.

Elkhorn, M. T.

R. T. WOLSTON.

Southern California.

[Editorial Correspondence.]

There is no mistaking the fact that California, as an entire State, is just entering upon a new departure in its development and growth. Our agricultural productions have gone far up beyond the hundred millions, and more than quintupled the output of gold and silver. But until quite recently wheat has formed almost the only product of the field which has attracted much attention abroad.

In process of time, however, the wheat market became more or less demoralized. Competition from India and South America began to be feared and felt. There was a noted falling off in the acreage yield. Extensive fields, costly machinery and large capital were required to reach success. Many farmers of small means were compelled, year after year, to mortgage their crops in advance to provide a living for their families and seed and cultivation for their fields. Dry seasons were sure to come once in three or four years, and all the little gains of the intervening years were swept away by a single year of drouth. Then again the large holdings of land-owners, their disinclination to divide up their holdings into small farms such as might be within the reach of newcomers with small means, and other untoward circumstances, had a tendency to discourage immigration. As a sequence, agriculture followed the course of mining, and in turn failed to draw.

A New Industrial Era.

But American energy can never be kept down so long as there is coal or water to turn a wheel, or an acre of ground untilld. California had practically reached and passed its climax in the production of precious metals and wheat, and there was need that some new and more profitable branch of industry should be sought out to give employment to idle hands already here and operate as an inducement for the tide of immigration to once more set in this direction. A few far-seeing people had in the meantime been giving their attention to fruit-growing as a more profitable pursuit than wheat-raising. Fine peaches and pears, apricots and plums, etc., began to make their appearance in the market in greater profusion than before, and, above all, the vinticulturists began to make a fine showing of both fruit and wine. While this branch of fruit-growing was gradually being developed in the northern and central portions of the State, new life was also infused into the hitherto slow-going population of Southern California, in the line of producing citrus fruits. It was soon found that Southern California was capable of producing the finest oranges, lemons and olives in the world. Hundreds of thousands of orange trees were planted and the home market was soon overstocked.

Just at this time the overland railroad came to the assistance of the fruit-grower, and special rates were established under which fruits of every kind could be placed upon the Eastern market at a profit to the grower. A new and vast field of enterprise and industry now dawned upon California, which in time will far eclipse the product of the precious metals and wheat combined. It is mainly to this new feature in our industries that the California of to-day owes the boom which is now sweeping over the entire State from north to south, and which has created an excitement and feverish desire for emigration thither from the East, such as has not been seen before since the great gold excitement of '49 and '50. There is now a general waking up all over California. The press is everywhere writing up the special advantages of their several localities, and the people are talking. Immigrants and visitors are pouring into the State by thousands. Our hotels are full and often to overflowing. More hotels have been built or have been put in progress of construction the past year than during any previous three years, and still there is call for more. All this means immense gains in prosperity, wealth, and population to the State. California seems to be fully alive to the great advantages of her position, and to the wealth of her resources. And yet, intelligent tourists from the East have repeatedly assured the writer, during the last few weeks, that we, as a people, do not even yet fully appreciate our opportunities, or realize the extent of the excitement which exists at the East in regard to the movement in this direction.

The City of Los Angeles.

This new influx into the Golden State made its first appearance at Los Angeles. It was there that the boom commenced, and probably no single locality in the State has been so much benefited. Nowhere else has there been such an advance in the price of land; nowhere else has there been such an increase in population or in growth of city or town. The population of Los Angeles in 1880 was about 10,000. Now in a little over seven years it has increased to over 40,000, and the increase is still going on as rapidly as at any previous time. How long this boom is to continue no one can tell. Certain it is, there is no present evidence of its cessation. There are many conditions that favor this rapid growth, all of which indicate permanent prosperity. Its railroad connections, already extensive, are being constantly augmented. One continental road has its terminus there, and a second makes it one of its

chief terminal points. Short lines of rails are being pushed out in every direction, to bring in the wealth and business of the surrounding valleys. It will soon be in direct communication with San Diego, by a line along the coast. The Government is spending vast sums of money to perfect one of its harbors—San Pedro; while private enterprise is equally active and energetic in actually creating another at Balboa. The constant rush and haste, the coming and going of trains and making them up at the Southern Pacific railway depot, is something quite remarkable, and gives evidence of the transaction of a large amount of business. There is constant and direct steamship connection between San Pedro, the principal port of Los Angeles, and the entire Pacific Coast, and it is confidently expected that steam communication will soon be established with other countries. One of the representative men of Los Angeles, Walter T. Maxwell, will leave for Europe June 4th, to purchase a steel steamer with a capacity of 1800 tons, to meet the growing demand of Los Angeles for coal. Although crude petroleum has supplanted coal in all manufactures and for all steam-making there, the coal trade of the section, mainly to supply the interior demand, has become so enormous that it cannot be handled with the present facilities. The new steamer will ply from Port Moody, B. C., to Southern California ports. Huge coal-bunkers will be erected at San Pedro, Port Ballona and San Diego. The draft of the steamer will be only 15 feet, which will save lighterage at San Pedro, and will drop coal at \$2 per ton here. After discharging coal here she will carry cargoes of fruit and other Southern California products to Port Moody for shipment over the Canadian Pacific.

The city has recently spread out enormously over all the surrounding country, a fact which has called into existence a most extensive system of street railways. Two cable roads are already in operation, and one electric motor, while ordinary one and two-horse cars are seen in every direction through the city and its environs. Probably no city in the Union, of its size, has such a thorough and well-equipped system of street railroads. In regard to

The Architectural Beauties of the City, And the rapid advance which it is making in everything which pertains to the permanent growth of a large city, we have neither time nor space to do the subject justice. That work speaks for itself. Every work of that character, either in progress or being projected, is of a substantial character and is being planned and carried out with the best architectural and engineering skill. The environs for miles in every direction around the city, and especially its picturesque heights, are being crowded with large and elegant residences and villas, which bespeak both the wealth and taste of the owners.

With the advancement of the city of Los Angeles, the suburban towns and the rural districts in every direction are marching onward in growth and prosperity. Already some of the whilom towns and villages are taking on the semblance of cities. The wave of Eastern immigration and tourist travel appears to be constantly on the increase, and we are assured by those now here that the excitement at the East in regard to California is constantly increasing, and will continue to increase into the indefinite future.

Institutions of Learning.

Los Angeles is fast becoming noted for its institutions of learning. A branch of the State Normal School was established here in 1881, by an appropriation of \$50,000, to which was added five acres of land, by the city, on a beautiful site worth fully \$20,000, to which \$10,000 have already been added in beautifying the grounds.

The University of Southern California, also located here, gives a full college course in all the leading departments of study, including law, medicine and theology. This university has four associate colleges, as follows: Chaffey College of Agriculture at Ontario; Maclay Theological Institute at San Fernando; College of Arts, Literature and Science, at Escondido, San Diego county; and one is to be established in the form of a technological and industrial school at Colton.

There is also a college for young ladies established here, under the supervision of Rev. D. W. Hanna, one of the most gifted and able persons who should have charge of such an institution. Their commencement exercises for the beginning of the term 1886-7 represented a higher order of attainment than is usual among this class of colleges. They have a new and enlarged building, with modern improvements in the class and lecture-rooms, dormitories, gymnasium, etc. An uncommon degree of success no doubt awaits the future of this institution.

The public schools of the county are under a most excellent management. The total number of children under 17, according to the school census of 1886, was 26,653. Total enrollment, 12,616. Total valuation of school property, \$545,509. There are 11 frame schoolhouses and 4 brick.

FREIGHT RATES AGREED UPON.—It was telegraphed from Chicago, Wednesday, that the following rates of freight were fixed: Wool, scoured—New York, \$2; Chicago, \$1.65; Missouri river, \$1.40; St. Louis, \$1.54. Hops, carload—Chicago, \$1.95; St. Louis, \$1.85; Missouri river, \$1.75. Barley—Chicago, 75c.; St. Louis, 72c.; Missouri river, 65c.

Prospectors.

The Pioneers of Western Civilization.

All over the great mineral West an army is in motion. Not an organized army governed by tactics, and marching with military precision toward a given point, but an irregular mass of humanity independent of any order, traveling in different directions as fancy guides them. From Old Mexico's sunny, vine-wreathed clime to the glacier-bound coast of Alaska, and far up the wonderful rivers of the Arctic slope, this army is moving. On the hot burning sands of Arizona's deserts, amid the snow-capped mountains of Colorado and Nevada, over the fertile fields of Montana and around the peaks of Idaho, these struggling, hardy pioneers of the coming civilization are going forth, penetrating the unbroken wilderness, examining the innumerable mountains and gulches, searching for the precious metals. We allude to that class of restless and adventurous beings called prospectors—a class that has done more to develop the resources of the West than the Government itself, or any expensive band of explorers ever sent out by it. Since that eventful day in 1848 when Marshall picked up the nugget in the tailrace of Sutter's mill in California until the present, prospecting has been an alluring occupation to many hundreds. Some join the ranks in hopes of sudden accessions to riches, many for the love of the wild, free, nomadic life such an occupation allows; some through failure in business at their old homes, others through unrequited affections. To recover their lost fortunes in the former instances, and to forget in the latter, causes many to try their luck on fortune's wheel, hoping that the blind old dame who manipulates it may give it a turn in their favor. At times fortune smiles on a grizzled prospector. In the language of the fraternity, "luck turns his way" and he suddenly acquires great wealth. These freaks of fortune in the few instances stimulate others to greater exertion, and encourage in them hopes of reaching the goal of their ambitions. The people who come into a mining country after it is well settled, traveling over well-graded roads in easy conveyances, little appreciate the trials and dangers the prospectors endured while pointing out the way to hidden wealth.

Too much credit cannot be given the hardy prospector who turns his back on civilization, takes his life in his hand, and risks everything for the purpose of unearthing the treasures that lie hidden far down in the bowels of the earth. Of course, his motive may in a measure be selfish, but he cannot or does not desire to prevent the coming millions from enjoying what his nerve and industry has brought to light.

Treat kindly the poor old prospector, for to him the people of the great West in a large measure owe their prosperity, and all should hold him in everlasting regard.—*Cœur d'Alene Record*.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DIRECT-ACTING ENGINE.—Joseph Pracy, S. F. No. 362,855. Dated May 10, 1887. This invention is more particularly applicable to that class of engines which are employed to operate pumps. It consists of a novel arrangement of a single valve with supply and exhaust ports and a mechanism by which the valve is operated.

FRUIT DRIER.—G. A. Fleming & C. F. Fleming, San Jose. No. 362,736. Dated May 10, 1887. This invention consists in various details of construction and arrangement relating to the heating of the air, its control and admission to the fruit chambers, the management and disposal of the fruit trays, the natural and artificial draft and other features,

In the Yosemite.

The flight of the seasons brings us again to the time for planning excursions to the Yosemite. It will probably be a year of unusual activity in the valley, for it will be only fair that our greatest gorge should share in the general boom. It may be commended as one corner of the State in which the real estate man has nothing to sell, but we do not know that that will commend it much, for our visitors seem rather to enjoy the real estate activity which now prevails.

We give on this page a view of four of the gems of the Yosemite, the engraving being reproduced from Major Truman's work, "From

"In a Mining Kitchen," by "I. H. B.," is an interesting sketch of pioneer days; "Pintacooset Colony" and "Chata and Chinla" are continued; short stories, sketches, poems, reviews and a supplement upon Albuquerque and the region tributary thereto complete the number.

Forests and Rainfall.

The tangle of decayed vegetation which covers the ground beneath the forest is of considerable thickness. On top it consists altogether of the decayed trunks, branches, and leaves, but it shades down into ordinary dark-colored soil at the depth of a few feet from the surface. This, the decay zone of the forest, lies between the

water-supply is the sea, which sends into the lands a tolerably regular annual store of moisture. When this falls as rain or snow, either of two things may happen—the water may go away directly to the sea, or it may return to the atmosphere as vapor to be again precipitated as rain. The chance of its re-evaporation is determined by the speed with which it flows to the streams. From a treeless region it rapidly escapes; in an extensive district of virgin forest it may again and again pass from earth to air, and from air to earth.

The columns of vapor, which in times of summer rain may be seen ascending from every great wood, afford visible evidence of the effect of forests on rainfall. They also may show the observer some of the most beautiful phenomena of atmospheric circulation. In a summer rain-shower the air above the trees becomes much cooler than it is in the recesses below their tents of foliage. This heated air within the wood seeks to rise, and escapes in great columns wherever there is a wide gap between the branches. As soon as it attains the cooler level above, the moisture is condensed, and the air, before transparent, becomes charged with steam. To replace this ascending air, a broad current drifts toward the emerging streams of vapor, commonly from the higher parts of the forest, where the air, owing to the elevation of the site, is cooler than in the lower levels.

This repeated passage of the moisture from earth to cloud, and from cloud to earth, greatly increases the amount of force which the rain applies in its falling drops to the earth's surface; but the rank vegetation protects the surface from the erosion which it would otherwise bring about. Even the forest-clad hillsides of the Cumberland mountains, where the soil lies on declivities of great steepness, suffer little wear as long as their natural protection is left to them. But as soon as they are stripped of the garment of wood which has been upon the region ever since, in the far-off ages, they came from the depths of the sea, they wear with great rapidity. The erosion is limited as long as they are forest-clad to the stream beds, and there is hindered by the innumerable obstacles of the fallen trees and entangled driftwood. The brooks which are strong enough to clear their beds and cut into the earth and rock, are few in number; we may often, on the flatter ground, find tracts of a square mile or more in area in which there is not a single stream that ever assails the surface of the earth. As soon, however, as the forest mat is removed, the surface becomes seamed with channels; they often, on the deforested surface, increase one hundred-fold in their length, and more than that measure in their destructive power. Relieved of all restraint from fallen timber, or the close-knit roots which enmesh the earth, they sweep the precious soil away toward the sea. In a single day a tilled field may lose from its surface more soil than would be taken from it in a century of its forest state.—PROF. N. S. SHALER, in *Scribner's Magazine*.

Domestic Animals of the World.

The *Scottish Agriculture Gazette* has made a conspectus of the live-stock of the world. From this it is found that there are in round numbers 92,000,000 head of cattle, 36,000,000 horses, 200,000,000 sheep and 46,000,000 swine in Europe.

In figuring on the collective live-stock of the several nations, it is found that Russia has the largest number of animals of every class. Inclusive of Poland and Finland, this Empire has no less than 25,000,000 head of cattle, 45,000,000 head of sheep, 10,000,000 swine and 17,000,000 horses. Sheep have increased 20 per cent in 20 years, and horned cattle and swine 4 per cent.

Next to Russia, Germany has the greatest number of cattle—about 15,000,000 head—but Germany has barely 25,000,000 sheep, 7,000,000 swine and only 3,000,000 horses. Austria-Hungary ranks third with 12,000,000 horned cattle, 7,000,000 swine and about 3,000,000 horses, but sixth on the list with regard to sheep, having only 20,000,000 head.

Austria stands next to France in cattle, having 11,000,000 head, but takes the fourth place in sheep and swine, having 24,000,000 of the first and 5,000,000 of the latter. Austria has 3,000,000 horses, and in this compare about with France and Servia combined.

Great Britain has but 9,000,000 cattle, but next to Russia, most populous in sheep, having 32,000,000 head. She stands fifth in the list of horses, having 2,005,000 head, and with 2,225,000 swine is sixth in the list. The census of live-stock in Great Britain has been reduced during the last six years by over 500,000 cattle, 750,000 hogs and 4,000,000 sheep.

Of countries outside of Europe, the United States has 45,510,000 cattle, 48,322,000 sheep, 12,077,000 horses and 42,092,000 swine. The La Plata States of South America, 19,500,000 head of cattle, 70,000,000 sheep and 500,000 swine. To these must be added 30,000,000 cattle found on the pampas-grass plains.

BIG DAMS.—Among the largest dams in the world for the purpose of storing water for mining purposes are the dams in Nevada. One is 425 feet long and 100 feet high; another is 576 feet long and 75 feet high.

An English inventor claims that bells made by soldering together pieces of bent metal give a much better volume of sound than cast bells.

VIEWS OF THE YOSEMITE, FROM RECENT PHOTOGRAPHS BY TABER.

the Crescent City to the Golden Gate." The engraving is from recent photographs by Taber, and will, we believe, be regarded by our readers as one of the handsomest of the many views of the valley which have appeared in our columns. The falls shown have been frequently described, and it will suffice now merely to give the height from which their water is poured into the valley: Bridal Veil, 900 feet; Vernal, 400 feet; Nevada, 600 feet. These are among the most beautiful falls of the valley, though the Yosemite surpasses them greatly in descent as it leaps 2526 feet from the crown of the ledge to the valley.

THE "OVERLAND" FOR MAY.—The *Overland Monthly* for May contains articles upon "The Mission of the Knights of Labor," by Irving M. Scott, treating of the various phases of the labor movement; "Causes of the Piute and Bannock War," by Maj.-Gen. O. O. Howard—the first of a series of Indian war papers; "The Mineral Resources of Southern California," by Henry De Groot, a treatise of the mines and mining interests of the southern half of the State; "Grandma Bascom's Story of San Jose in '49," by M. H. Field, a vivid and picturesque sketch of early times in the Santa Clara valley; "Agriculture along the Rio Grande," by O. E. Cronwell, an interesting article upon the capabilities of the central New Mexican valley.

houghs of the air and the branches of the roots. In it go on the most important actions which take place in our forests—actions which affect the history of land and sea. We shall therefore have to consider it in a somewhat painstaking way. The most evident effect of this sheet of decaying wood, and moss which feeds on the decay, is on the rainfall of the region which it mantles. When, after a season of drought, a copious rain falls upon this spongy mass, the water is for a long time absorbed in the interstices and does not flow to the river. Even in times of very heavy rain the water is slowly yielded to the streams; after a dry period of many weeks this sponge retains a good share of water. A like amount of rain falling on tilled fields or prairies slips quickly away to the rivers, and thence to the sea. The first result is, that when the land is destitute of forests it sheds water like house-roofs, breeding floods after every considerable rain, while in the forests the rain is only slowly yielded to the streams.

A second and less evident result of the spongy character of the forest-bed is that, by hindering the escape of the rain-water to the rivers, it increases the actual rainfall of the country. To see the nature and importance of this action, we must turn aside for a moment to consider the origin of the rain which falls upon the land. The original source of this

SAN FRANCISCO:

Saturday Morning, May 28, 1887.

TABLE OF CONTENTS.

EDITORIALS.—The Cogswell Polytechnic College, 345. Passing Events; An Aid to Mining Interests; Reaching the Goal of Wealth by the New Road of Economy; Report of the Director of the Mint; Coin or Certificates, 348. Silver Bullion; The L. de Milo Headley; The Nansimo Coal Mine Disaster; Mariposa County Resources, 349.

ILLUSTRATIONS.—The Cogswell Polytechnic College, San Francisco, 345. Shaft No. 1 of the Vancouver Coal Mine, Nansimo, B. C., 349.

CORRESPONDENCE.—Geological Formations; On Selling Mines; The Pine Creek Mines; Exaggeration of Mines; Southern California, 348.

MISCELLANEOUS.—Prospectors; Notices of Recent Patents; In the Yosemite; Forests and Rainfall; Domestic Animals of the World, 347.

MECHANICAL PROGRESS.—Welding Copper; The Value of Exhaust Steam; The Laws of Friction; The Relative Value of Natural Gas and Coal; Steam Boiler Improvements; Locomotive and Railroad Bridges, 350.

SCIENTIFIC PROGRESS.—The Early Denuding Forces; Electric Light Without Machinery; The Quaking Earth; Zest and Mechanical Motion; Changes in Bleaching Powder by Keeping; The Effect of Certain Odors; Another Earthquake Theory; Formation of Diamonds; Putting to Sleep by Telephone, 350.

GOOD HEALTH.—The San Francisco Medical Association on Cancer; Starving the Teeth, 351.

USEFUL INFORMATION.—How to Cleanse Drop Oil; The Healing Power of Gas; Discovery for Converting Non-Saponifiable Oil; Singular Effect of a Lightning Stroke; Green and Dry Timber; The Explosion of Dynamite; Condensed Breath; Sarcophagus—Its Meaning; Lake Formed by Flooding from an Artesian Well, 351.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 352-3. MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 353.

Passing Events.

The discovery of a large quartz ledge on another of the islands of Alaska will direct renewed attention to the mining interests of that Territory, which even now are prosperous when the small amount of work done is considered. The ledges up there are phenomenally large.

The abundant supply of snow in the mountain regions of California will give a good water season, and be of great benefit to the gulch and ravine miners, though this is not now of so much importance to the State as when the hydraulic mines were allowed to work.

Immigration to this State still continues large, and the vacant lands are rapidly settling up. The advance in price of land in the more populous portion of the State is bringing the larger tracts into the market to the great advantage of many sections.

The use of water-power for driving machinery in the quartz mines is increasing, and wherever practicable it is being adopted. This is one of the means by which the cost of working ore is decreased.

DR. ALFRED RUSSELL WALLACE, the famous English savant, lectured on the Darwinian theory of evolution on Wednesday and Friday evenings at Pioneer hall, before a select and cultured audience. He was introduced by Prof. Joseph Le Conte, of the University of California, who briefly alluded to evolution as the greatest idea of modern times. Dr. Wallace's lecture was a scholarly effort highly appreciated by his hearers.

An Aid to Mining Interests.

The area on this coast within which mines are being worked has largely increased of late years. For a long time most of the mines operated were in California, Nevada, Montana and Utah. Very little was done in Arizona, and Idaho was only partly prospected. Even in Montana the camps which are now the principal ones were not known a dozen years ago. Idaho has new and prosperous camps in the Wood river and Cœur d'Alene countries. Montana has developed wonderfully in the past few years. Arizona has got rid of its Indian iconuh, and is developing its mining fields. New Mexico is opening up new areas. Oregon is doing better than it has ever done before. Alaska has come into the list of bullion-producers, and the way it is showing up on big ledges is somewhat surprising. Nevada alone has retrograded, mainly owing to the failure of the bonanza of the Comstock lode. The miners even there are working away, however, and do not seem discouraged at their poor luck. They are taking measures to work their low-grade ore, and when they are able to do that at a good profit will take on their old-time prosperity. Washington Territory with little gold or silver has steady profit from its coal mines which are largely increasing their product.

During all these years the MINING AND SCIENTIFIC PRESS has been mainly devoted to these mining interests. It has seen the growth of the various camps and watched their progress. It has recorded the current mining news from week to week—the strikes, developments, etc. It has gathered information for the use of the miners of the coast on all topics which would benefit or interest them. It has often illustrated, at much expense, and described the improvements in mining appliances and metallurgical processes, and sent its representatives to the mines in all the Coast States and Territories in quest of information which would be of use to its readers.

The PRESS fills a different field from that of the local paper. No camp can well do without its home journal, of course, and a good newspaper in a mining town should largely devote itself to mining affairs. But the PRESS is not local in its character. It aims to collect information of a practical nature which will be of benefit to the miner or metallurgist wherever he may be. The current mining news is compiled and condensed in a special department, covering a wide field, to be sure, but so arranged as to be easy of reference. But the descriptions of processes, appliances, machinery, etc., are scarcely within the province of a local paper, which is not generally in a position to illustrate by means of engravings.

The MINING AND SCIENTIFIC PRESS is the oldest mining paper or periodical published in the United States. Its editors and publishers have had many years' experience in industrial journalism, and understand the wants of their patrons. There are subscribers now on our lists whose names have been there for more than 20 years. Our correspondents are many, and their letters, coming as they do from so many quarters of the mining regions, are of great interest to the mining public. It is safe to say that millions of dollars have been saved to individual miners and operators, and much more added to the wealth of the Pacific States, by the intelligence disseminated through its columns during its successful career of over 27 years in its field of wonderful growth and development.

There are many who have taken up the business of mining of late who would be benefited by being subscribers to the PRESS. They will find it a conservative and truthful exponent of the mining industry, and from its columns they will obtain much practical information of all kinds. They can learn what others in the same business are doing, and hear of all the improvements in mining and milling as fast as they are developed. Those who are familiar with the PRESS will do well to call the attention of others to its merits.

Of all mining journals ever published in this or any other country, the PRESS has been most significant for the large proportion of practical mining information it has contained. The exchange of views of mine-workers and metallurgists of practical working ideas alone makes the paper worth many times its cost to the average miner and metallurgist. A single hint may be worth thousands of dollars.

Reaching the Goal of Wealth by the New Road of Economy.

The early stock of Californians, they who were attracted to the country by the glamour of the gold mines, came here in the hope of being able to acquire a speedy fortune. In their eagerness to accomplish that end, the mines not always rewarding them according to expectation, these Argonauts were tempted into all kinds of speculations, the majority of which, it is needless to say, proved failures. Meantime, the habits of the entire population were extravagant, nearly everybody spending to the full extent of their income or their earnings, which, as a general thing, were large so long as the mines continued to yield liberally. But at length the production of gold began to fall off, and with it came diminished wages and a devaluation of prices generally. But the speculative spirit and the spendthrift habits contracted during the flush times still remained, our people continuing their prodigality long after their ability to earn had been so seriously crippled. And so, year by year, they grew poorer and poorer, until sheer necessity compelled the observance of greater economy, a change that it took a full decade or more to bring about, so firmly had this disposition to squander become rooted among all classes. We wish we could say that it had even now become wholly eradicated. But so great is the improvement that has already been effected in the direction of greater economy and thrift, that we may be said to be a regenerated people. The changes that have been wrought in this respect are best seen by comparison. Twenty years ago the average Californian, in planning for a homestead, contemplated a grand establishment erected at a cost ranging anywhere from \$20,000 to \$100,000. Ten years ago the amount to be appropriated for such purpose had shrunk 50 per cent or more, and now the most of our people believe they could manage to get along with a much less costly residence even than this, the ambition of many not going beyond an outlay of \$1000 or so. Men there are, who, recalling how comfortable they were living in a log cabin in the mines, fancy now that a person might at least exist in a \$500 dwelling, some of these being, perhaps, persons who, in the high old times, would have scorned to think of inhabiting anything less than a \$20,000 mansion.

As with changed circumstances visions of palatial dwellings have vanished, so has the old-time banking after a corresponding grandeur in other respects been subdued or essentially modified, our inordinate desires having been in good measure subordinated to necessity and reason. The spacious grounds, with their artistic walks and costly exotics, have given place to the vegetable garden with the succulent potato and the pungent onion. The convenient horse-car has been largely substituted for the gilded phaeton, with its coat of arms and the prancing steed, while the nickel-plated watch fills the fob formerly occupied by the much jeweled time-keeper; and so on through the long category of our once multiplied wants and luxurious desires. As regards sumptuous living, costly equipage, fine apparel—in all our expenditures a willingness to retrench and save is noticeable, nor is it probable that we have yet quite reached bedrock in this direction. In certain respects further contraction might well be practiced. In the matter of *gush* this is absolutely called for. To impulsive squandering of money for little worthy objects and purposes many of our people are still too much addicted. To be accounted a lavish giver has been with Californians a consuming vanity, and one that sticks to some of them even in their impecuniosity.

But in having so far learned to save as well as to earn, our people are entering on a new career, and one that insures for them a grand and lasting prosperity. This was the one thing requisite to that end, our former spendthrift habits having gone a long way toward neutralizing our many natural advantages. As before we vainly hoped to grow rich by speculating, so are we now sure to reach that end by saving.

Two large consignments of Portland cement have arrived from London, purchased by the Pacific Improvement Company for work on the projected cable roads. The Earl Dalhousie brought 13,630 barrels and the British Isles 16,000.

Report of the Director of the Mint.

There are two sources from which the bullion product of the country is annually figured up. Wells, Fargo & Co., who handle most of the gold and silver, keep statistics, which are pretty generally recognized as reliable, and upon the basis of these figures, for many years past, the product of the various States and Territories is each year determined. The Director of the U. S. Mint also reports on this subject. The figures of the two authorities do not agree always. We gave, in our annual mining review in January, Wells, Fargo & Co.'s estimate. The Director of the Mint estimates the production of the United States in 1886 to have been: Gold, \$35,000,000; silver, \$51,000,000. The value of silver in the above estimate is calculated at the coining rate of silver in the United States silver dollar, namely, 1.2925 per ounce fine.

In the Mint report the production of gold shows an increase over prior years of \$32,000,000. The production of silver is slightly less than in 1885. The tabular statement shows that the production of silver in the United States has largely increased from 1880, when it was \$39,200,000, to \$51,000,000 in 1886. The production of gold in 1880 reached \$36,000,000, against \$35,000,000 in 1886. Colorado maintains the first rank as the largest producer of precious metals in the United States, the value of its production of gold and silver having been over \$20,000,000 during the last year. California takes second place to Montana with a production of nearly \$17,000,000, against \$16,000,000 by the former. The production of Nevada and New Mexico has decreased, while that of the other States has remained almost constant. Texas, for the first time, is added to the list of producers.

The annual supply of silver from the mines of the world has largely increased in the last four years, and the period is covered by a marked decline in the market price of silver. Since 1872 the coinage value of gold was \$31,400,000; silver, \$7,000,000; total, \$38,400,000. A total metallic stock on January 1, 1887, was, of gold, \$641,400,000; silver, \$331,800,000; total, \$973,200,000. The Director's figures go to show that of the stock of gold coin estimated to have been in the United States on the first of the present year, there was in the Treasury of the United States and in the National and State banks and in circulation on the Pacific Slope, \$360,000,000, leaving \$200,000,000 in the hands of the people and banks and savings institutions of the United States, east of the Sierra Nevada mountains (other than the national banks and 849 State banks which reported to the Controller of the Currency).

Coin or Certificates.

It is stated that the Treasury Department is considering a proposition to make efforts to substitute paper currency circulation for the present coin circulation of the Pacific Slope, and secure the return of gold coin to the Treasury as a means of strengthening its reserve, to save loss from abrasion and furnish a cheaper and more convenient currency. It has long been regarded as a desirable object to secure the return of this large gold circulation to the Treasury vaults. Pacific Coast Congressmen who have studied the situation say gold certificates would be accepted, but silver certificates would be rejected. It is conceded that silver certificates of large denomination would be rapidly returned to New York, but it is thought for the sake of convenience smaller denominations would certainly be retained in circulation if the other forms of money are withheld. Secretary Fairchild states that thus far he has not issued any orders for the substitution of paper currency for gold coin as a medium of exchange in the Pacific Coast States.

There is, perhaps, more certainty of silver certificates being issued than gold. There is a pretty general feeling, however, among the people of this coast that gold answers very well as it is, and it is not probable that they will take kindly to paper currency. So many Eastern people have come here of late that paper is more familiar than formerly. We have, however, been used to hard coin so long that our people are not desirous of any change in this matter. If the change is made, it will not be until July.

J. B. RANDOL, manager of the New Almaden quicksilver mine, has gone East.

Silver Bullion.

The speculators in New York, who gamble in almost everything, are now talking of taking up silver as a shuttlecock. They propose to make New York, instead of London, the central market for silver. It is proposed to deposit the bullion in some bank or other safe place and issue certificates of deposit to represent it, and that speculation shall be carried on in these certificates. Grain is speculated in in the same way, and after Sept. 1st other staples will also be sold on warehouse certificates. Orde petrolum is represented by pipe-line certificates, in which there is a large speculation. The idea is to have the bullion certificates listed by the Stock Exchange.

Ex-Treasurer Jordan, vice-president of the Western National bank, says: "There are numbers of men getting the idea into shape, but it will not be ready for several weeks yet. The Western National bank will not speculate in silver. We will issue certificates for silver, or rather act as a registration organization, but we shall not do anything else, for we propose to do only a legitimate banking business. London now controls the silver market of the world. If this scheme goes through, as it surely will, that controlling power will be in this city. Instead of our being dependent on London for the price of silver, London will have to depend on us. The organization of the scheme has so far progressed that the form of certificate is now being discussed."

Director of the Mint Kimball thinks that the proposition to make New York the chief seat of the bullion trade, and thus transfer the center of the silver market from London to New York, is impracticable. The price of silver in London is the price of silver in New York, less the cost of transportation. The London silver quotations are received every day, and on these quotations the price of silver is fixed. Silver bullion might be stored and warehouse certificates issued against it, and those certificates be traded in the same as any other commodity; but the Director added: "I do not see how there could be much made by the transaction. The same thing

was attempted with iron some time ago, but it was a failure. The Iron Exchange, or warehouse, or whatever it was called, may be still in existence, but it has never done much."

Mr. Kimball does not think the syndicate could corner the silver market and put the price of silver up. England gets her silver from Mexico and South America, as well as from America, and if American silver was forced up there would be a greater export market for Mexican dollars. The price of silver in London is not so much regulated by the supply as by the allotment of India consol bills—that is, drafts made by the Indian financial authorities in London on the Government of India, and the price at which these drafts are purchased in London by brokers and merchants depends on the state of trade and the demand that may exist for the same. Though this is not the sole controlling factor in the price of silver in London, it is a factor of considerable importance. In 1878 an attempt was made to corner the silver market and make the Government pay an enhanced price for it, but we bought in London—that is to say, we paid the London price, plus transportation, and then it cost less than we were offered it here. If anybody wants to corner silver he will get very much of a job.

This scheme, if there is anything in it, is simply one to make another article to speculate in.

The Late Milo Hoadley.

Milo Hoadley, a pioneer of this city, and a well-known civil engineer, was killed by being thrown from a buggy, near Sonoma, Tnolmne county, on Thursday of last week. Mr. Hoadley was 77 years of age. Milo Hoadley was born in Plymouth, Conn. He came to this State in October, 1849, and at once entered upon the practice of his profession of civil engineering. He came prominently before the people about the year 1854 in connection with a proposed system of sewerage of the city, which was known at the time as Hoadley's grade. Many people claim now that had Mr. Hoadley's ideas been carried out the trouble of late years in draining and sewerage of the city south of Market street would have been avoided. He was a member of the old Vigilance Committee and had been a member of the Society of Pioneers since its organization. Mr. Hoadley was City Surveyor and City Engineer of San Francisco in the early days, and did a vast amount of work in laying out the streets, etc., here. He

The Nanaimo Coal Mine Disaster.

The terrible disaster at the Nansimo coal mines recently was the cause of the loss of over 150 miners' lives and the destruction of a great deal of property. We give on this page an engraving from a photograph of the Vancouver Coal Mining Co.'s shaft No. 1, showing the hoisting works, engine-house and office before the disaster occurred. The mine is, as the views show, near the edge of the salt water, and the drifts of the mine run out under the sea.

There are several shafts in this mine, but this No. 1, of which we give the view, is the point where the fire occurred after the explosion underground. The two wheels shown at the top are the sheaves on the gallow-frame over which the wire ropes pass to the reels on the engines in the engine-house. The other ends of the ropes are secured to the cages which travel up and down in the shaft, after the manner of elevators in buildings. The men descend into the mine on these cages and are hoisted out by them. Coal is wheeled in small cars on to the cages and hoisted to the surface, where it is dumped into the bunkers, as the receiving bins are called.

Mariposa County Resources.

The Diltz Mine.

We this week received a visit from Mr. Angevine Reynolds, editor and proprietor of the *Mariposa Gazette*. Mr. Reynolds has been in bad health for several years and is here to experience a change of climate and to secure the services of a physician. He has been here a little over a month and it would seem that the desired change of climate is about all that is needed, for he has improved surprisingly. Since his arrival here he has been engaged in introducing mines of his county, and more particularly the celebrated Diltz mine, which has been referred to frequently through the columns of this paper in its mining news, taken from the *Mariposa Gazette* and other papers.

The Diltz mine is evidently a fine property, judging from all that has been said and the rich specimens of gold that have been taken therefrom and exhibited to the public. Mr. Reynolds has with him, which he exhibited to us, a 10-pound specimen covered with coarse gold. It is a beautiful nugget, rare to be seen, and contains something over \$2000.

This mine has in the past 16 years produced considerable gold and a great number of rare specimens. Capt. Diltz, the owner, has always refused to build a mill or hire men on account of its richness in specimens and pockets, which were too tempting, as a general thing, for human nature to withstand. We are told that the mine shows a true fissure vein from a foot to 14 feet thick of both high and low-grade ore. The mine bears other characteristics which are valuable, and is situated in one of the richest and best gold-producing sections discovered since the days of '49.

It is generally believed there are hundreds of thousands, if not millions, of dollars in the point of mountains through which this mine passes. What is needed and will require the aid of capital is to run a tunnel 1700 feet on the vein, to drain the water and to put the mine in a position for stopping. This done, if deemed necessary, mills could be erected and the mine handled in the most profitable manner.

Mr. Reynolds is armed with maps and plan

showing the Diltz mine in all its phases, and unless some one desires to purchase the property as it stands, he wishes to organize a syndicate which will work the mine to the best advantage. Mr. Reynolds has a fine map of the county, which shows all the important mines, rivers, towns, and places. He can point to several most excellent farms, ranches, and vacant land, which can be purchased, with improvements, at rates amazingly cheap at this time. Yosemite valley is in Mariposa county, and it will not be long before it must, with others, realize a boom, for it has the advantages of a lovely climate, rich mines and fertile valleys, and rolling hills covered with timber and springs of water, all of which will make lovely homes for the industrious immigrant.

Mr. Reynolds has established an office at 131 Montgomery street, opposite the Occidental hotel, where he will be for a time, with a view to giving information to immigrants in search of homes, or to capitalists in want of mines. His office hours will be from 10 A. M. to 4 P. M.

RIVERSIDE is to have an electric railroad 12½ miles long. An organization of local capitalists has already been made and sufficient capital raised.

SHAFT NO. 1 OF THE VANCOUVER COAL MINE, NANAIMO, B. C.

was well known to most of the civil engineers in California. He was a member of the Technical Society of the Pacific Coast, and took great interest in its proceedings. Mr. Hoadley was a genial man, well liked by all who knew him.

BITUMINOUS ROCK MINES.—The *San Luis Obispo Republic* says: James Cormac, an experienced miner, has been made superintendent of the bituminous rock mines, and is opening them for extensive operations in a thorough and workmanlike manner. A hillside has been cut away, leaving a large face of the pure bituminous rock exposed. He says he can now get out 500 tons a day, and will soon be enabled to take out 1000 tons daily, if required. The supply is unlimited; the demand and facilities for transportation are all that is wanted.

THE GRASS VALLEY TIDINGS says: The Chinamen propose to swarm into hydraulic mines, work as long as allowed, get themselves arrested and jailed in Yuba county for 500 days each, and thus eat out Yuba county. They will keep both the jail and hydraulic mines full of men all the time.

The Omaha smelting works employ 500 men.

From these bins it is discharged into cars which carry it to the wharves and deposit it on the vessels for shipment. At the time of the explosion many miners were in the drifts and etopes which extend from the bottom of the shaft out under the waters of the harbor of Nanaimo. No such disastrous accident as the one which occurred at this mine has ever happened in the coal mines on this coast before.

It is to the credit of the people of California that liberal contributions in money were at once sent to assist the families of the dead miners, in addition to the sums collected in British Columbia. Many rich men subscribed, and many poor ones too. A feature to be noted is the subscription from California miners. The Plumas Eureka mining employee contributed \$225. The miners of the Savage and Hale and Norcross sent \$300. The New Almaden miners sent \$283, the company, \$250, and Manager J. R. Raudol, \$250 more, making from this mine \$817. In this connection it may be stated that the names of the contributing miners were sent to Mr. John Rosenfeld, the agent of the mine here, when the money was forwarded.

ABOUT 500 tons of chrome ore was shipped from Livermore to Philadelphia last week.

MECHANICAL PROGRESS.

Welding Copper.

The recent discovery of a process for welding copper has created much interest all through the country. In addition to what has already been given upon this subject in these columns, the following from the *Boston Journal of Commerce* will be read with considerable interest:

The successful welding of copper was one of the lost arts. Scientists have expended millions of dollars in attempts to rediscover the art known to the ancients, but have failed utterly, its discovery being reserved to an unpretentious blacksmith named James Burns. James Burns was, until very recently, a blacksmith in the Allegheny Valley railroad shops, at Verona, Pa. He believed copper could be welded, and with patience and perseverance set himself the task of rediscovering the long-lost art, and after eight years of toil and study succeeded in welding together, perfectly, pieces of copper. Elated with success, but careful to keep his method a secret, Burns announced his discovery and was laughed at, but when he resorted to hammer, anvil and fire and in less than ten minutes welded together two bars of copper more perfectly than it was possible to weld steel, the doubters became converts and realized that a discovery had been made scarcely second to any made during the present century. Park, Scott & Co., extensive workers in copper, of Pittsburgh, would not believe that copper could be welded, notwithstanding the welded samples were submitted to them, whereupon Burns convinced them by going into their works, and, in the presence of Mr. Scott, the superintendent, and others, successfully welded, with ordinary tools, a number of pieces of copper, making welds so strong by pounding the pure copper together that it is impossible for them to give out as do brazed parts.

Mr. Burns' success is due, says the *Industrial Gazette*, to a chemical mixture, or compound, the ingredients of which are kept secret. The mixture is cheap, and very little is necessary in making a weld, the discoverer in his public tests using only a small phial full. The discovery opens up a new field in copper working; in fact, will revolutionize some lines of manufacture. The inability to weld copper has always been an insurmountable obstacle to the economic use of that metal in many directions, making it very expensive, where its use was absolutely necessary, owing to its peculiar qualities. In making copper steam pipes for engines and locomotives they had to be worked up out of the solid raw mass of copper by a sort of boring process, which was tedious and costly. To make a copper ring for fitting over a joint in pipes or cylinders, it had to be cut round out of a square piece of solid plate copper. This caused waste, and the consumer was charged for the whole square. The waste could often not be melted over into another plate, because by the present smelting methods the slightest impurity mixing in it will spoil the whole mass. To repair broken or defective copper pipes, chambers or vessels, brass had to be used, by which in a whole day's labor the piece could be brazed. But should an intense heat ever strike the brazed part afterward, the brass would melt and thus the piece be ruined. Mr. Burns' discovery, however, revolutionizes old methods. A straight piece of copper can now be curved into a circle and then welded together in a ring for fitting over joints, thus saving the waste of cutting it from a square plate. Pipes may be made in the same way, being welded instead of worked out of the solid. Mr. Burns has even made a copper boiler for a small engine by his welding—something unheard of. In the process of welding the copper is purified, another remarkable feature of the discovery. No impurity mixing in the smelter interferes, and old scraps have been remelted and welded into all sorts of pipes, joints, and fittings by Mr. Burns.

The Value of Exhaust Steam.

We notice, in the practice of model establishments where the most attention is paid to economy in the use of steam, an increased appreciation of the value of exhaust steam for purposes of heating and for the various processes connected with manufacturing. Steam users are realizing that true economy does not consist alone in developing a horse-power upon their engines with the least possible coal per hour, but in doing the entire work of the mill, including the heating, with the least possible expenditure of fuel, even if the proportion of coal used for power proper is greater. The old idea that there is no economy without a condenser is being sacrificed to the recognition of the fact that it is better to use up the latent heat of the exhaust steam in heating the mill, and in the various processes of cleansing, dyeing, slashing, drying, etc., than to allow it to run into the river in the overflow from a hot well. While the condenser, properly applied, is an important factor in the direction of economy, its use may be easily carried beyond a beneficial point. In one of the model mills of New England where the steam plant and its management have been the subjects of much scientific thought and study, the practice during the past winter has been to run a large compound engine backward, i. e., to use high pressure steam in the large cylinder and run the small cylinder condensing. The large cylinder exhausts, under the required back pressure, a large volume of steam into the

heating circulation, and a portion of this steam is taken from the circulation, expanded in the small cylinder, and exhausted into the condenser, leaving the major portion for heating and manufacturing purposes. While this may appear crooked engineering to those whose interest lies wholly in the engine itself, we have no doubt that it will result in a lower aggregate coal bill than if the engine had been run as it was intended it should be.

The Laws of Friction.

Friction is greatly influenced by the smoothness or roughness, hardness or softness, of the surfaces rubbing against each other.

It is in proportion to the pressure or load; that is, a double pressure will produce a double amount of friction, and so of any other proportionate increase of the load.

The friction does not depend upon the extent of surface, the weight of body remaining the same.

The friction is greater after the bodies have been allowed to remain for some time at rest in contact with each other than when they are first so placed: as for example, a wheel turning upon gudgeons will require a greater weight to start it after remaining some hours at rest than it would at first. The cause of this appears to be that the minute asperities which exist even upon the smoothest bodies gradually sink into the opposite spaces, and thus hold upon each other. It is for the same reason that a greater force is required to set a body in motion than to keep it in motion. If about one-third the amount of a weight be required to move that weight along in the first instance, one-fourth will keep it in motion. The friction of axles does not at all depend upon their velocity; thus a railroad car traveling at the rate of 20 miles an hour will not have been retarded by friction more than another which travels only 10 miles in that time. It appears, therefore, from the last three laws that the amount of friction is as the pressure directly, without regard to surface, time or velocity.

Friction is greatly diminished by unguents, and this diminution is as the nature of the unguents, without reference to the substances moving over them. The kind of unguent which ought to be employed depends principally upon the load; it ought to suffice just to prevent the bodies from coming into contact with each other. The lighter the weight, therefore, the finer and more fluid the unguent should be, and vice versa.

THE RELATIVE VALUE OF NATURAL GAS AND COAL.—Of Pittsburgh coal, 55.4 pounds contain the same number of heat units as 1000 cubic feet of natural gas. With coal \$1.20 per ton, 1000 feet of natural gas would then be worth 3½ cents. But by tests made by the Westinghouse Air Brake Company, 1.18 cubic feet of natural gas evaporated 10.38 pounds of water—that is, one pound coal equals 12.25 cubic feet of gas, or 1000 feet gas equals 81.32-49 pounds coal. This difference results from the expenditure of heat necessary to raise solid fuel to the gaseous state, which must be done before combustion can take place. In a house grate the loss on this score from using coal would be more than in a large furnace of a factory. Hence the greater economy in the use of natural gas is in houses and small establishments. Two years ago only six rolling-mills and steel works in the United States used natural gas as fuel; now we have a record of 63 rolling-mills and steel works which use the new fuel, and of 16 which are making preparations to use it. Every rolling-mill and steel works in Allegheny county, Penn., 55 in all, now uses natural gas. In Western Pennsylvania, outside of Allegheny county, it is used in 12 mills and steel works, and seven others, including the rolling-mills and the Gao-tier departments of the Cambria Iron Works, 79 miles east of Pittsburgh, are preparing to use it. One rolling-mill in Ohio is now using it, and eight mills are getting ready to use it. At Wheeling, West Virginia, one mill is making arrangements to introduce it. In all but a very few of the mills and steel works referred to, natural gas is used as fuel exclusively.

STEAM-BOILER IMPROVEMENTS.—Considerable is said about improvements in boilers, but there are boilers in actual use that are giving nearly all the heat of coal into steam, and if some practical method could be found for saving the loss in flue gas, the boiler would be practically perfect. We are fairly successful in getting the heat of coal into steam, but very unsuccessful in converting this heat into work. It should be remembered that it is heat we have to deal with, and pressures, etc., are mere incidentals, while the engine is a crude arrangement of converting this heat into work, and engineers should be as careful of the unite of heat that perform this work as they are of the pennies that make the dollars.

LOCOMOTIVES AND RAILROAD BRIDGES.—The great increase in the weight of the locomotives which have recently been put upon railroads for hauling freight trains, requires firmer roadbeds, heavier rails and much more substantial bridges than those heretofore constructed when lighter locomotives were used. It is said that the iron and steel bridges on the Pennsylvania railroad built several years ago prove to be too flimsy for the 60 ton freight-haulers recently put on—118,000-pound engines—and new structures of stone or heavy steel are replacing all other so far as practicable.

SCIENTIFIC PROGRESS.

The Early Denuding Forces.

In a careful examination of the earth's surface the observer is always struck with the immense displacement of material which must have occurred, after the present mountain chains had been formed, by some powerful denuding agency unknown at the present time. We can conceive of no present conditions of the elements which could have been adequate to such results. There can be no disputing the fact that the immense hills and vast plains or tablelands of gravel, piled up in some regions, must have been broken up and removed from their original places of deposit by aqueous agency. But our present supplies of water from rainfall, or any other source, are quite insufficient for such an immense work. Glacier action and the secondary effects of existing water-courses serve only to bring to light and magnify the results of some earlier and more powerful agencies. The immense mountains and tablelands, composed of ancient drift deposits which have recently been opened by the hydraulic miners of this State, furnish a notable example of the power and vastness of these ancient denuding forces.

Mr. Proctor has lately expressed the opinion that the present denuding effects of air and water are absolutely as nothing compared with the denuding forces which must have been in operation when the earth was young—that the oxygen and nitrogen of the air are but a residuum of what was once there; but, beside these gases, now in due proportion to support the earth's life, there were immense quantities of carbonic acid gas, of sulphurous acid, sulphureted hydrogen, chlorine, boracic acid and other destructive gases, some ready to assume the liquid form and thus be still more destructive. Mr. Proctor thinks there must also have been immense quantities of water in the form of vapor—in fact, the pressure of that primeval atmosphere must have been so great that the waters of such oceans as then existed could have turned into steam only at a temperature so far above the boiling point at the present atmospheric pressure that the surface of the ocean must actually have glowed with inherent lustre; the water vapor in the air must have been steam at high pressure and intensely hot, and the rains falling then must have been torrents of hot water, impregnated with destructive acids, and falling on intensely heated rocks.

ELECTRIC LIGHT WITHOUT MACHINERY.—A new electric light, without the employment of dynamo-electric machines, has been introduced in London. The *Citizen* says the system is known as the upward battery, and the plant is of the simplest description, occupying a small recess in the cellar about 6 feet by 5 feet. The management of the battery merely consists in turning on a couple of taps and winding up a clock once in 24 hours, an operation which is certainly within the scope of the meanest capacity. The battery then works on automatically and silently, generating and storing electricity continuously day and night. The upward battery differs entirely from all other primary batteries, and possesses none of their disadvantages. It consists of carbon plates and zinc cylinders, placed in earthenware cells, the zinc being consumed in about six months by the action of chlorine gas. The gas is made by admitting hydrochloric acid to an earthen pan containing manganese, a sufficient quantity being made in two hours to supply the battery for 24 hours, and is stored in ordinary drain-pipes. The plant is inexpensive, a battery—including gas retort and acid jars, gas-holders, primary cells, accumulators and clock-work apparatus, for charging the storage batteries—being supplied for \$280. The manufacturers have published an estimate for a plant sufficient to light an ordinary house, with 25 lamps, of which ten may be lighted for six hours every night, five more in other rooms for half an hour every night, and the whole 25 lamps for six hours at intervals of three days, during which time the extra current is being stored. The cost of such a plant would be about \$680.

THE QUAKING EARTH.—The peculiar terror of an earthquake lies mainly in the suddenness of its approach. Volcanic eruptions are usually preceded by vast rumblings, or jets of steam, or other unmistakable tokens. Hurricanes and cyclones in like manner have heralds that announce their coming. But with an earthquake there are no premonitory symptoms. The great earthquake which took place at Lieben in the year 1755 found the people engaged in their ordinary occupations. All the shocks were over in about five minutes. The first shock lasted about six seconds. In that brief space of time most of the houses had been thrown down and thousands of men, women, and children crushed beneath the ruins. At times the ocean lends fresh terrors to the scene. Thus at Lisbon, a wave of water over 50 feet high rushed in among the houses and covered what still remained. In the island of Jamaica on a different occasion, 2500 houses were hurled in three minutes under 30 feet of water. Recent

delicate scientific experiments have discovered the fact that the surface of the land is never absolutely at rest for more than 30 hours at a time. Thus those great earthquakes which make epochs in history are merely extreme cases of forces that seldom sleep.—From a lecture by A. Forbank.

HEAT AND MECHANICAL MOTION.—Professor Tyndall, in his lecture on heat, had what he termed a thermo-electric pile so arranged that when anything colder than the surrounding air was put against the face a pointer would turn in one direction, and if anything warmer, it would turn in the other direction. He then filled a vessel with air under pressure, and allowed the vessel to remain in the room until the air had become of the same temperature as the air in the room. Opening a pet cock, he directed the air from the pipe against the face of the pile, and the pointer showed that the air was colder. He then took a pair of bellows and directed that against the face of the pile, and the pointer showed that the air from the bellows was warmer. In the first case the work performed of forcing the air against the pile was done with the pressure of the air within the vessel, therefore the heat performing the work must be taken from the air in the vessel, making it colder; but, on the other hand, the work was performed by the man's muscles, and the heat was taken from the body. This is a fair illustration of the phenomenon of heat being converted into mechanical work. This subject of heat, while somewhat complicated, is one of the most interesting and important studies of the young engineer, as without a thorough knowledge of this a large part of his observations must be in the dark.

CHANGES IN BLEACHING POWDER BY KEEPING.—A very interesting series of experiments has recently been made by Mr. John Pattinson, of England, to ascertain what changes take place in bleaching powder by keeping. He placed two casks of bleaching powder, and samples of the same, in sealed glass bottles in the cellar, and kept them there from Jan. 29, 1885, to Jan. 5, 1886—nearly a year. The temperature of the cellar ranged from 35° to 61° F.; during the 12 months repeated tests were made of the bleaching powder; at the end it was found that the loss of available chlorine was nearly the same in the casks and in the bottles, though the casks had increased in weight from the entrance of moisture and carbonic acid. The loss of chlorine was only from 2 to 2½ per cent of the weight of the bleaching powder; but of the weight of available chlorine the loss would be about eight per cent, the sample being from 36 to 38 per cent quality. Mr. Pattinson proposes to make experiments at a higher temperature for a lengthened period. It is to be noted that the small amount of chlorate of lime found in the bleaching powder at the commencement had entirely disappeared at the end.

THE EFFECT OF CERTAIN ODORS.—The aroma of red cedar is fatal to house-moths; the aroma of black walnut leaves is fatal to fleas. It is a matter of common observation that persons engaged in the business of making shingles from odoriferous cypress timber in malarial districts are rarely, if ever, affected by malarial diseases, and that persons engaged in gathering and distilling turpentine do not suffer from either malarial diseases or consumption. It is said that when cholera was epidemic in Memphis, Tenn., persons working in livery stables were entirely exempt from it. It is affirmed that since the destruction of the clove trees on the island of Ternate the colony has suffered from epidemics unknown before; and in times when cholera has prevailed in London and Paris those employed in the perfumery factories have escaped its ravages.

ANOTHER EARTHQUAKE THEORY.—A possible cause of earthquakes in Europe has been suggested to the French Academy of Sciences by M. A. Blavier, who associates the great disturbances of 1755, 1884 and 1887 with abnormal accumulations of ice about the North Pole. He supposes such accumulations to have caused a deflection of the Gulf stream away from Europe, producing great climatic changes and a slight disturbance of equilibrium in the sea-bottom, followed by a possible local fracture along the line of least resistance. Evidence of the in-rush of cold oceanic waters is furnished by the disappearance of sardines from the west coast of Europe during the years in question.

FORMATION OF DIAMONDS.—A Swiss physicist, Prof. Simmler, maintains that diamonds have been formed by the taking up of soluble carbon by liquid carbonic acid, and its subsequent deposition in a crystalline form on the evaporation of the acid. This could only take place in rock cavities strongly compressing the carbonic acid, which would quickly disappear on release from the pressure.

PUTTING TO SLEEP BY TELEPHONE.—In France, persons are said to have been put into a hypnotic sleep by telephone. A newspaper editor was hypnotized in two or three minutes after placing the telephone to his ear, the operator being a mile distant.

IODINE, hitherto known in nature only in combination with other elements, is now found in a free state in the water of Woodhall Spa, near Lincoln, in England. The water is colored a decided brown by the iodine,

GOOD HEALTH.

The San Francisco Medical Association on Cancer.

Our readers will recollect the brief notice which was made in these columns of the meeting of the San Francisco City and County Medical Association, on February 22d, the subject of discussion being "Cancer." We now append the official report of the meeting as made by the secretary in the *Pacific Medical and Surgical Journal* of this city:

The meeting having been called to order by the president, Dr. James Simpson, the minutes of the former meeting were read and approved.

On the motion of Dr. John L. Morse, the reading of Dr. Frisbie's paper was dispensed with, and he was invited to open a discussion on the same subject. As Dr. Frisbie declined, the president requested Dr. Morse to open the discussion.

Dr. Morse said that before discussing the curability of cancer it was necessary to come to some understanding of what is meant by cancer, as the term is popularly used to describe any tumor that brings about or contributes to a fatal termination. The origin of the disease has been ascribed to various sources. Virchow traces it to connective tissue, Billroth to epithelial structures, another authority to the endothelium of the lymphatics, and Conheim to mal-position of the structural layers in the fetas. The therapy of the disease may be summed up in the statement that nothing will remove carcinoma except the knife and fire. The general opinion is that only early operation will be of any avail, and even then that the disease will recur in a few years; so, in the face of this, we hardly can expect much from medicaments.

Dr. Rosenstirn did not believe that because we do not know the etiology of the disease, we should, therefore, cease to discuss its therapy. It is true that the various epitheliomata have been somewhat amenable to treatment by excision, but we cannot say the same regarding cancer of the pylorus.

Fowler's solution, chian turpentine and other remedies have been used very extensively in the treatment of different varieties and have met with a small degree of success, and, therefore, it is our duty to try every creditably indorsed remedy either for the cure or amelioration of the disease.

Dr. W. P. Gihbons said that he never had been successful in prolonging the life of a patient suffering from true carcinoma by medications, and believed that one great obstacle to a successful therapy lay in the difficulty of diagnosis in the early stages. He presented to the society the sketch of a carcinomatous liver taken from a case occurring in his own practice.

Dr. Simpson had seen many cases of cancer, but could only speak of them from a clinician's point of view. He did not believe any case of internal cancer had ever been cured, and those reported as such could be explained either by errors in diagnosis or deceit on the part of the medical attendant. The highest object of treatment, therefore, can only be to make life endurable to the patient and let him die easily.

Dr. Stallard had directed his attention to this subject for many years, and agreed with Dr. Morse that greater efforts should be made to obtain a correct etiology of the disease, which would certainly contribute to the possibility of its prevention or amelioration if we cannot cure it. There has been a great increase in the number of people suffering from carcinoma during the last 40 years, and it becomes a matter of interest to know the cause of this increase, which can only be done by collective investigation of the social class, habits and employment of those suffering from it which would yield us some idea of the conditions favoring it. In the meantime we must not lose sight of treatment, for while we have no great hope in medicine, there are well-authenticated instances of relief from chian turpentine and the local applications of bromine, and as they ameliorate the sufferings of the patient, they should be tried. Dietary probably has considerable to do with the increase of the disease within the last 40 years, as during that time tea, sugar and coffee have come into more general use, and it is an interesting question how far these may have influenced cell nutrition.

There being no further business, the society adjourned.

In commenting on the above, we would remark that a very important feature in the proceedings of the meeting was the refusal of the association to listen to the reading of the paper which was intended to open the discussion. After a few preliminary remarks, the author of the paper proceeded to present to the association some original and very important observations which he, in connection with several other medical gentlemen, had made in regard to the alleged success which had attended the practice of a certain specialist in San Francisco, in the treatment of a large number of cases which had been pronounced "cancer" by several of our most prominent physicians and surgeons. A number of these cases had been once and twice extirpated by the surgeon's knife, and the same surgeons had announced their second and third

return, with the advice that they should be again submitted to the knife. The patients in question were subsequently placed under the treatment of the specialist referred to and the cancers removed, in some cases (where no knife had been used) by constitutional treatment and massage, with simple vegetable ointments. No caustics are used by this practitioner—no minerals in any form whatever. Complete success had attended a very large number of cases, and, with only one exception, there had been no return of the malady, although from five to ten years have intervened since the patients had ceased to take treatment. The chief object of the paper in question was to bring this matter to the direct attention of the society, and secure, if possible, an official investigation into the matter. But every effort to accomplish that purpose was frustrated by a decided vote to suppress that portion of the paper in which the effort was made to bring something new to the attention of the association. The society preferred to discuss the question from "a scientific standpoint," as they termed it, or from observations which were only to be found in the "hooks." The reason assigned for that course was that the practitioner employed secret remedies and was not a member of the regular medical school. The fact was ignored that the practitioner had sought the privilege of taking up a regular course of study at one of our city medical colleges and been refused admission simply because she was a woman. (Such a decision could not be made to-day; public opinion having since secured the admission of women to medical schools.) Had her petition been favorably received, her treatment would have been sooner and no doubt much more perfectly developed and freely given to the profession and the world.

But as by the act of that body she was compelled to continue her work unaided and in comparative darkness, now that she has developed what appears to be a successful constitutional treatment of cancer, unaided by the profession, she proposes to retain the secret temporarily for her own pecuniary benefit. She is willing, however, to afford every possible opportunity to any regular members of the medical profession to test her skill and study her mode of treatment in any and the most severe manner which they can devise. She is willing to test the success of her practice on any patient or patients who may be selected, when the disease has not reached an extreme crisis.

The object which the writer of the paper referred to had in view, and the object which the writer of these articles has in view, is to secure unquestionable medical evidence of the success or non-success of the remedies in question. If the former should be the result, it is proposed to make an appeal to the public or the Government to raise a sufficient sum of money to purchase the secret and give it to the faculty and the world.

The matter could be readily decided by a proper investigation in a very short time, and the writer is assured that, if favorably decided, there would be no difficulty whatever in obtaining any reasonable amount which might be required to place such invaluable information before the medical world. The fact that there are such large numbers of persons in this city and vicinity that have certainly been completely relieved by this practitioner of what our best physicians have freely pronounced cancers, any candid person would think ought to be sufficient to warrant an investigation at once. In common with large numbers of our leading citizens with whom we have consulted, we hold that it is the bounden duty of the medical faculty of this city to recall their act of February 22d, and, in the name of common justice and humanity, make inquiry into a matter which is of such paramount importance to the health and lives of this community—of the entire world. What we want, and what the public wants to know, is, have these persons whose names and cases have been published, and many others whose names might be added, been really cured of cancers? Will the physicians whose names have been freely published in this connection deny that they have pronounced them genuine cases of cancer? If these people have been afflicted with cancers, how is it that such patients, who, according to the hooks and the discussions of the February medical meeting, ought to have been in their graves long ago—how is it, we ask, that they are to-day walking about the city and attending to their business like other persons? Have the physicians and surgeons made mistakes in their diagnosis in so many cases? Have they made so many terrible mistakes in cutting out what were only innocent tumors?

Are they prepared to say that they have been mistaken in their diagnosis? These are important questions for somebody to answer. There is something wrong somewhere. This is an inquiry of no ordinary importance. Large numbers of people in this city are becoming quite nervous over it—and well they may!

We learn by correspondence and personal conversation that many physicians outside of this city are beginning to take a different view of the question from that taken at the late meeting of the Medical Association of S. F. They hold that the evidence produced fully demands an inquiry, and many propose to take the necessary measures to secure it. So far as the writer is concerned, he simply desires to reach the truth, wherever or whatever it may be. He has been sorely afflicted in his own family by this terrible scourge, and with many others he is

determined to know whether a true constitutional remedy for cancer has been discovered. The evidence so far, to the mind of the writer and to the mind of every physician who has looked carefully into the matter, is largely in favor of the affirmative, and we propose to continue this agitation until some person properly qualified and duly authorized shall inquire into it, and make a full and unprejudiced report thereon. Humanity and scientific research demand it. The public demands it.

Starving the Teeth.

"Teeth are just as easily starved to death as the stomach," said a lecturer before a Brooklyn audience the other night. "The fact is that you and your fathers have from generation to generation been indolently starving your teeth. In one way it is a blessing to have been born of poor parents. What food the poor give their children is of a variety that goes to make strong bones and teeth. It is the outside of all the grains of all cereal foods that contain the carbonate and phosphate of lime, and traces of other earthy salts, which nourish the bony tissues and build the frame up. If we do not furnish to the teeth of the young that pabulum they require, they cannot possibly be built up. It is the outside of corn, oats, wheat, barley and the like, or the bran so called, that we sift away and feed to the swine, that the teeth actually require for their proper nourishment. The wisdom of man has proven his folly, shown in every succeeding generation of teeth, which become more and more fragile and weak. These flouring mills in Minneapolis are working destruction upon the teeth of every man, woman and child who partakes of their fine holsted flour. They sift out the carbonates and the phosphates of lime, in order that they may provide that fine white flour which is proving a whitened sepulcher to the teeth.

"Oatmeal is one of the best foods for supplying the teeth with nourishment. It makes the dentine, cementum and enamel strong, flint-like and able to resist all forms of decay. If you have children, never allow any white bread upon your table. Graham bread is made of whole wheat ground, not holsted, so that the bran, which contains the minute quantities of lime, is present. To make a good, wholesome, nourishing bread, take two bowls of wheatmeal and one bowl of white or holsted flour, and make by the usual process. Nothing is superior to Boston brown bread for home and tooth building. This is made out of rye meal and cornmeal. Baked beans, too, have a considerable supply of these lime salts, and should be on your tables, hot or cold, at least three times a week. In brushing the teeth, always brush up and down, from the gum instead of across. Brush away from the gum and on the grinding surfaces of your teeth."—*Brooklyn Eagle*.

USEFUL INFORMATION.

HOW TO CLEANSE DROP OIL.—An interrogator in an Eastern paper wanted to know how he could cleanse the thick drop oil from the engine, hearings, shaftings, pulleys, etc., so that it could again be used for lubricating, and received the following answer in reply: This drop oil is collected in many mills and factories to be cleaned and used again. A little apparatus has been constructed for this purpose, which, it is reasonable to suppose, is patented. It may be described as follows: The apparatus is a box-like concern, of several "stories," the interior either lined with or consisting entirely of lead. Above, it has a shoulder like a funnel, into which is poured the oil to be cleaned. The purified oil passes off through an escape-pipe in the bottom. The different shelves, or "stories," are perforated and covered to a height of about two inches with raw, loose cotton, through which the oil must percolate. The cotton serves as a filter and retains all kinds of contaminations. After the oil has in this manner passed through the several shelves, it is nice and clean and drops into a vessel underneath. The dirty cotton is occasionally replaced by clean. This is about the most inexpensive way of effecting it that I know of. It is also necessary to add that the apparatus must stand in a warm place. The cleaning of the oil with chemicals is both a tedious and a doubtful process, because even after thorough washing it may still retain traces of acids, rendering it unfit for lubricating purposes.

THE HEATING POWER OF GAS.—A series of tests has recently been made by Dr. Fischer, the well-known German chemist, showing that in ordinary domestic stoves in use not more than 20 per cent of fuel consumed is really utilized for warming the rooms, whereas, with stoves burning gas, 80 per cent and more of the possible effect is obtained. In a sugar manufactory at Elsdorf, it is stated no steam engines have been used for several years. Gas is made at a cost of about 20 cents per 1000 cubic feet, and is used for lighting and driving gas engines. At the Essen works, water gas is made at a cost of 4 to 16 cents per 1000 feet, and serves both for fire and lighting.

DISCOVERY FOR CONVERTING NON-SAPONIFIABLE OILS.—Baillard, of Rouen, has patented a discovery which, if actually what it is stated to be, will have far-reaching consequences. It is for converting non-saponifiable oils into saponi-

fiable oils, and so admitting the whole class of mineral oils to all the uses of fat oils. The change is effected by oxidation; in the provisional specification he says that his discovery is based on the fact that oleic acid possesses in a high degree the property of transferring to mineral oils a portion of its oxygen; the same property resides in acrolylo or acroleic acid and animal or vegetable fats in a rancid state. In the complete specification the use of chlorine as an oxidizing agent is mentioned along with hasio oxides. Mineral oils treated as described are said to be perfectly applicable for use in the woolen manufacture, and by the addition "of from 2 to 10 per cent by weight of fixed vegetable oils, such as cotton, castor, etc., are being employed as mordants in dyeing fabrics composed of vegetable fibers."

SINGULAR EFFECT OF A LIGHTNING STROKE.—A very singular result from a stroke of lightning is reported by a correspondent of the *Germantown, Pennsylvania, Telegraph*, as having occurred in the town of Barrington, Yates county, N. Y., near the celebrated Crystal spring. The report reads as follows: "It did not rain very hard, but the thunder and lightning were just fearful. Lightning struck in six or eight places in a space a mile in diameter. Among the rest it struck a large wild cherry tree some few feet in diameter and 20 or 30 feet to the limbs. It literally tore the tree all to splinters, scattering the pieces over a space 70 or 80 rods in diameter. A goat was under the tree, and it was, of course, killed. On going to it, it did not show any mark of hurt, but just a little drop of blood on its nose. When the skin was taken off it was found to be crushed to a mass of jelly. The carcass looked as though it had been ground to mincemeat. On taking the skin away it had not the least resemblance to a carcass; bones and all were reduced to a mass of pulp. It is a singular case. Let some of your scientists explain."

GREEN AND DRY TIMBER.—A discussion is going the rounds of the press as to the relative strength of wet and dry timber. We do not believe there is much to be made out of the discussion. Some kinds of timber are stronger when dry, while other kinds are stronger when wet or green. It is safe to say that all woods are harder and less liable to bend when dry than when wet or green. But most hardwoods when wet will possess more tensile strength than when dry. Timber thoroughly seasoned is more brittle than when green, and with the necessary force will break square off, while the same timber green would stand about the same pressure by bending more or less without breaking. Take a hickory sapling that is almost impossible to break in its green state, although it may bend double, and thoroughly dry it, and you may easily break it almost "square off," as the boys say. So with almost any kind of timber. Drying makes it stiffer, more unyielding, but in very few instances stronger.

THE EXPLOSION OF DYNAMITE.—If one particle of a mass of dynamite is exploded, the explosion of the rest of the mass is ordinarily supposed to be instantaneous, but it is not quite so. If a lot of dynamite was housed in a continuous train of four miles, it would take a second for it all to explode. Even this is scarcely an appreciable length of time; but if a continuous train of dynamite were poured over the ground between San Francisco and New York City, it would take a quarter of an hour for the explosion to reach from one point to the other. A man, therefore, might sit on the end of the train of powder in New York City and be in perfect safety for 15 minutes after the San Francisco end of the train had begun to explode.

CONDENSED BREATH.—If the condensed breath collected on the cool window-panes of a room where a number of persons have been assembled he turned, a smell of singed hair will show the presence of organic matter; and if the condensed breath be allowed to remain on the windows for a few days, it will be found, on examination by microscope, that it is alive with animalcules. It is the inhalation of air containing such putrescent matter which causes half the sick headaches, which might be avoided by a circulation of fresh air.—*Philadelphia Bulletin*.

SARCOPHAGUS—ITS MEANING.—The ancient Roman and Greek coffin was generally of stone. In some cases it was of a peculiar kind of stone, which was claimed to have the faculty of destroying the entire body, with the exception of the teeth, in 40 days. Hence the name "sarcophagus," literally meaning flesh-eater. The name is still applied to stone coffins only. The "flesh-eating" stone for coffins, as used by the Greeks, was called *lapis Assiis*, or Assian stone, because it was found at Assos, a city of Lydia. The stone is now supposed to have been a species of limestone.

LAKE FORMED BY FLOODING FROM AN ARTESIAN WELL.—The project of flooding a portion of Algeria from the sea has been abandoned, but it seems that large tracts may be covered with water from other sources. De Lesseps reports to the French Academy that a single artesian well bored in 1885 is yielding some 2000 gallons a minute, and has formed a considerable lake 30 feet deep, reclaiming from 1200 to 1500 acres of waste land.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ROLLER-MILL.—*Ledger*, May 21: The roller quartz-mill of the Original Amador mine, at Amador City, was started last Sunday morning. There is a full complement of men at work at the big tunnel at Middle Bar, some working in the upper tunnel, and some in the winze in the big tunnel. The air compressor is not being used, the work at present being done with hand drills. The Dane mill is crushing ore from the Griesback claim in Pioneer district. The condition of the plates indicates a very satisfactory result. Ben Ross has got out about 50 tons of ore from his mine near Volcano, which is estimated to yield fully \$50 per ton. At the Reed & Askey claim near Irishtown, about six miles from Jackson, they have a vein from four to five feet wide, of high-grade rock, which the owners calculate will average \$20 to \$25 per ton. It shows free gold in abundance. The ore is easily extracted at a cost of about \$1 per ton. At the Amador gold mine they are starting another shaft, 400 feet south of the present working shaft. There was an old shaft about 60 feet deep, and this they are cleaning out and repairing, with the intention of sinking it deeper.

SUTTER CREEK.—*Amador Ledger*, May 21: The large hydraulic pump of Knight's patent is in successful operation at the Wildman mine. It is capable of throwing 275 gallons a minute. No further delays are anticipated, and the water is to be taken out to the bottom of the shaft as soon as possible. Preparations are being made to open the Mahoney by taking out the water. Wood is being hauled, and I expect to see the pump working in a few days. The Iowa mine is running along smoothly. The 10 stamps are kept going most of the time. Sam Wearn, the foreman, has put in a self-dumper at the hoisting works—a contrivance of his own, which works remarkably well, and the mine under his management is looking better than for a long period past. The patent dredger was shipped from Knight's foundry this week to Lambing gravel mine, near Lone. It will be in operation in a few days. The enlarging and repairing of the Amador canal in the neighborhood of Bald Rock flume is finished. The capacity of the ditch at this point has been increased nearly 1000 inches. New flume has been put in for a distance of one mile, and the ditch is said to be in better condition than ever before. The steel pipe for the Plymouth line of ditch has all arrived, and a large portion of it has been made. Some 1100 feet will be required.

LIGHTING MILL AND MINE.—*Amador Dispatch*, May 21: We understand that the owners of the Kennedy mine, near this place, are talking of lighting up their mill and mine with electric lights in the near future. The South Spring Hill mine at Amador has been using the electric light for some time, and we understand the result has been very satisfactory to the owners. The one-stamp quartz-mill, formerly used at the St. Julian mine, will be moved to the Sargent mine at Middle Bar, and used to crush ore at that mine hereafter. The rock taken out of the latter mine lately has been very rich, and the indications are that it will soon take rank among our most permanent and paying mines.

Butte.

GULCH MINING.—*Butte Record*, May 23: The amount of snow in the mountains at the present time will enable the miners to do a good summer's work in the gulches and ravines. Quite a number of mines have been located in Kimshaw township, to the east of Chico.

FORBETOWN QUARTZ.—Every few years quartz mining at Forbetsown takes on a new boom, and excitement runs high for quite a period. Pretty soon somebody will strike it, and that pioneer mining district, known in '49 as Toll's diggings, will be found the best quartz-mining section in the State. The *Record* has seen it when it was a lively mining camp.

El Dorado.

GOLD DUST.—*Georgetown Gazette*, May 21: It is estimated that about \$50,000 worth of gold dust is sold at this place and Georgia Slide, during the year. Of this amount the Chinese sell about one-half.

WORK.—*Placerville Democrat*, May 21: Messrs. Combella, Hicks, Papiot and others who are working in the Alderson mine, Cedar ravine, have been putting in a very large amount of work in the claim during the past few months. During the winter they put in 700 feet of tunneling in order to reach the channel and pay-gravel, and had just secured pay-dirt when foul air was encountered in such quantities as to cause them to quit for a time. They are now working an upraise, which is expected to be finished in a few days, when an abundance of fresh air will be secured, and work will again progress in gravel which is known to be good pay. Work was begun upon the Independent mine this week, and will be pushed ahead as rapidly as possible. Messrs. Kern and others have put in the entire winter and spring, so far, running a tunnel in their claim in Cedar ravine, and have at last reached the channel and found rich pay-dirt, which it is expected will yield them large returns. The straightening up of accounts of the men on the Kum Fa and Cedar Ravine mine means a renewal of work in these claims, and work for a number of our miners who have for some time past been idle. Reports from Grizzly Flat indicate prosperous times ahead for the camp. Several new properties have recently been opened up and show very well, while good bodies of mineral have been found in old claims, consequent upon good development work being done. The Big Tunnel scheme in Big canyon now promises to be a success and soon to be in active operation.

Fresno.

HILDRETH NEWS.—*Fine Gold Miner*, May 20: Two important developments have been made in the district during the week. While sinking the shaft at the Hildreth mine, an 18-inch ledge of good ore was opened up, which demonstrates the true course of the Hildreth ledge, showing that, at a depth of 350 feet, the ledge bears southeast and northwest, dipping to the northeast. From develop-

ment, the main body of ore lies east of the working shaft. The company is hoisting ore from the two lower levels from a two-foot ledge. The mill has six weeks of ore to run upon without addition to the dumps. Since work commenced on the Wilson mine a decided improvement has resulted by the ledge widening out to 4 feet between walls. The ore prospects very good. Mr. Wilson is having the ore worked and hauled to Jim Smith's arastra. The sulphurets are being saved on blanket sluices. The McNally Co. is sinking its working shaft, and will run off drifts at each 100-foot level. The mill is working on good ore, with a prospect of an increase of hullion shipments during the month. John M. Wilson states that at the Texas Flat mine the showing is very encouraging for the future. While raising a stope in the tunnel, a body of high-grade ore was opened up, which has stimulated the company to further prospecting. There is a possibility of a mill being put up. Nate Moody, of Hildreth, has bought an interest with Mr. Anderson, on Temperance Flat, in a prospect that is claimed to be a ledge of merit. That successful mining operator from the other side of the mountains, Mike Walsh, has bought an interest, and is now the manager of the Black Hawk mine, which upon its surface prospected so much coarse gold that it caused the adjoining ground for one-half a mile to be located. Good work is being accomplished on this claim. McKenzie & Rule are the owners of the much-talked-of Last Chance mine, which ledge upon the surface crops out for 500 feet along the course of the lode, which they are the owners of, development being done on each claim. But the main prospect is the Last Chance, which is located upon the eastern end of the surface croppings, and is most favorably situated, being located upon the east side and end of the ridge and the north side of the ravine. The main tunnel is in upon the ledge 500 feet, showing a strong ledge of quartz the entire distance, swelling out to seven feet in places, while the average size of the lode is three feet. From this tunnel the amount of stopping ground is considerable. The owners have a 10-stamp mill upon the mine. They have been crushing ore with results that show the good quality of the ore the ledge contains. The Hampton mine, located on Prussian hill, is being worked in ledge matter, and from present indications will soon tap the main ledge. Nevens & Taylor have struck a body of ore in their shaft at the Flemming mine. The above parties have a lease upon the property, which, since development, has opened up a good little mine.

Inyo.

PALMETTO.—*Register*, May 19: A letter from Deep Springs states that the probability is good of a 10-stamp mill being put up at Palmetto this summer. Fifteen tons of ore recently shipped from Sylvania to Reno, yielded over \$1000 clear of expenses, and the owners say they have plenty more for shipment.

Kern.

LONG TOM.—*Kern Co. Californian*, May 20: Probably one of the best, if not the best gold mine in the State, is that of Messrs. Webb and Hirschfeld, at Long Tom, 15 miles as the bird flies from Bakersfield. It has been worked so long and exploited so extensively that it may be said to be of proved permanency. Probably the ore has not been drifted out to an average depth of more than 300 feet, and the shaft, upon which the process of sinking is kept up night and day, has not yet attained a depth of 500 feet. The work thus far done shows that the vein has steadily increased in size with a corresponding rise in the grade of the ore; the best that has yet been found being at the deepest point reached. A mill of 20 stamps is kept running night and day. To supply it with ore is a matter of no difficulty from a vein that averages seven feet in thickness. Messrs. Webb and Hirschfeld say they have ore enough in sight to keep their mill running for two years; but they propose to push the work of further opening the mine without intermission. While beyond a reasonable doubt they have a mine that can be profitably worked for a life-time, they are disposed to take nothing on trust and will strive to learn positively, as soon as possible, just what they possess. The prudence, thrift, and economy practiced at the Long Tom mine are commendable in the highest degree, and if the same had always been the rule in California, gold mining would now be known as a safe and reliable business generally; not as now in exceptional cases only.

Mono.

THE BODIE.—*Miner*, May 23: The east crosscut, 900-foot level, was driven 30 feet; cutting through about three and a half feet of vein upon which we will sink to the 1000-foot level. The north drift from this crosscut was driven 25 feet, showing the ledge 600 feet wide. Upraise No. 1, 1000-foot level, to connect with the winze from the 900-foot level, has reached a height of 14 feet.

STANDARD CON.—Ore shipped to mill for the week, 397 tons. Mill running steadily. Shipments made on Thursday, 19th, valued at \$13,375.42.

THE BULWER CON.—The west crosscut from the north drift, 100-foot level, was driven 20 feet. The north drift, from winze No. 1, was driven 14 feet, showing the vein two feet wide. North drift, 150-foot level, has been extended 10 feet; the vein at this point was one foot wide.

THE MONO.—The west crosscut, No. 2, 800-foot level, was advanced since last report 16 feet.

CON PACIFIC.—North drift has been advanced seven feet. In the face of this drift the ledge is looking well and yielding fair milling ore.

THE ORO.—Work on old Oro ground has been recommenced. It is expected to reach the bottom of the shaft (700 level) in a day or two, when the legitimate work will be begun. We have reason to believe that we shall receive favorable reports from the Oro soon.

Nevada.

AT THE COE.—*Foothill Tidings*, May 20: Work of constructing the necessary buildings at the above-named mine is well under way. A reservoir for the storage of water for motive power is being dug on the summit of the hill, back of the works. This will cover an area of about half an acre, and will be finished in two weeks. Eighteen hundred feet of pipe will be required to bring the water (which will be supplied by the South Yuba Co.) from the reservoir to the mine, and it is now undergoing the process of tarring. The pipe was obtained from the Gold Run Hydraulic Company, and is 24 inches

in diameter. A pressure of over 180 feet will be obtained at the mine, and Pelton wheels will, no doubt, be used. Patsy Ryan is superintending the reservoir work.

DELHI DIVIDEND.—*North San Juan Times*, May 20: The Delhi Mining Co., on the 14th instant, declared a dividend (No. 4) of 10 cents per share on its capital stock, aggregating \$10,000. The Delhi mine is paying handsomely. During the month of April, so we hear, it yielded \$11,000, the expenses of the company for that period being about 10 per cent of the amount. The mill has only 8 stamps. The ledge is 10 feet wide, and heretofore has milled \$20 to the ton; but it has improved lately in richness, and it is thought that it is now yielding \$40 to the ton. As to the permanency of the mine, we think no doubt is now entertained, and it promises to soon have an enduring reputation as one of the foremost mines of the State. The mine is owned exclusively by local parties. The success of the Delhi demonstrates that this part of the county is not lacking in rich mineral resources.

REDUCING FORCE.—*Transcript*, May 22: Another reduction in the number of men employed in the Empire quartz mine at Grass Valley was made Friday. Over 60 have been discharged during the week, most of them being unmarried. It is understood the force will be increased again soon.

DRAIN TUNNEL.—*Grass Valley Union*, May 20: Good progress is being made in opening the drain tunnel of the Brunswick mine, which is found in a better state of repair than was anticipated. Over 500 feet of the tunnel has been put in good condition and retimbered where necessary.

PROVIDENCE.—*Foothill Tidings*, May 23: A month or two ago, the Providence mine, of Nevada City, discharged a large number of men. On Saturday night the remaining force, with the exception of four men, were notified that their services were no longer required.

Placer.

IOWA HILL.—*Placer Herald*, May 21: Our mines are about the same old story; only a few of them, comparatively, are working. The Morning Star is doing well. Watts Bros., at Strawberry Flat, are keeping several men at work. Hobson, at the Blue Wing, keeps a gang on the bedrock. Poorman & Jurgenson, at Wisconsin, or rather Prospect hill, are steadily opening out and developing their mine, and some of these fine days we will hear of shipments of gold from there. McIntire reports favorably from the mine, and is very hopeful of finding the pay streak soon. The quartz mines near Damascus are working quite a number of men, and reports are very favorable. The Mountain Gate, of Damascus, is too well known to require much more than passing notice. Lew Williams says that soon the bullion will be rolling out. Red Point is lively, and the upraise going ahead, and the hopes of all are that they will strike it rich.

Plumas.

PLUMAS EUREKA MINE.—*Greenville Bulletin*, May 20: J. H. Uch, who was over from Quincy last week, says that rich developments have been made in the Plumas Eureka mine; that better ore is now being milled than the company has had for many years. Although the mine has been paying dividends regularly, the people of Plumas will be pleased to know that the owners are to be handsomely rewarded. The mine is operated upon a systematic and economical basis throughout, which is usually the case with English companies.

FINE ORE.—A few days ago we were shown some very rich ore taken from the Drury mine, at the head of North canyon. Gold could be seen in dozens of places. Ore of this grade would certainly produce several hundred dollars per ton. The new wheel for the mill will soon be completed and crushing begun.

San Benito.

THE OIL INDUSTRY.—*Hollister Free Lance*, May 21: A miners' meeting was held on May 12th, in Vallecitos valley, for the purpose of organizing a mining district for the boring of petroleum wells. A set of miners' laws was read and adopted, and Mr. R. Ashurst was elected recorder. The district was named the Vallecitos Petroleum Mining District. Those who organized the district were D. McDonald, president; Chas. Bronson, secretary; R. Ashurst, E. Bowman and Dave Coleman. Since the organization of the district, 12 claims have already been located, and more will be located shortly. The Nevada Company is now thoroughly organized and ready to proceed with the work. Work on the Paulsell claim has recommenced, being under the supervision of Mr. Anderson, a gentleman who understands his business. The well is now down about 100 feet. The Nevada Co. expects to bore a 10-inch well to a depth of 700 or 800 feet before the flow is reached. Old petroleum well-borers pronounce the prospects for oil in the valley to be exceedingly good.

Sierra.

COARSE GOLD.—*Mountain Messenger*, May 21: Rouse & Co., at Deadwood, took out a nice prospect of 19 ounces of coarse gold last week. The boys think they have the deadwood on a rich channel.

SIERRA CITY.—Mr. P. A. Lamping came down from Hog canyon last week. He reports things as looking well up in that country. The Primrose Co. does not intend to crush much rock this summer. The pumps will be set to work and the water got out, after which a tunnel will be run to strike the main chimney, which is thought will take the greater portion of the summer. Last week Mr. Van Trump and F. X. Labonte were up to look after the interest of the Badger Mining Co., between Packer and Upper Salmon lakes. A shaft was sunk and some very rich rock was taken out. The company stopped the shaft on account of having so much water to contend against. A tunnel was started and connection is expected to be made in a few days.

A NEW PROSPECT.—*Sierra Tribune*, May 20: Last Saturday a *Tribune* reporter, in company with Geo. Sharp and Oscar Brown, crossed the Yuba river and visited the American Flag and Banner quartz claim. This mine is situated about one-half mile from town, and was located a couple of weeks ago by H. F. Kynoch and Wood Davis. The parties have already sunk on the ledge about 10 feet, and uncovered a vein three feet in width, with a course of northeast and southwest. The quartz is of an excellent character and prospects exceedingly well in free gold. The owners have graded a place

below the present shaft and will start a tunnel in a short time.

THE TRIUMPH CON.—Dr. J. S. Stone, who visited the Triumph Consolidated quartz mine, near the Keystone, reports it to be a true fissure vein, cutting the country rock in an east and west course and dipping to the north. Also found free-milling ore several hundred feet along the ledge rich in gold. As water can be obtained all the year around for milling purposes, and timber is in abundance, there is no reason why the mine cannot be worked economically.

Trinity.

TRINITY CENTER.—*Cor. Trinity Journal*, May 21: There is not much stir in this section except among quartz prospectors, of whom there are quite a number, and more are arriving daily.

INDIAN CREEK DISTRICT.—*Trinity Journal*, May 21: We learn from Mr. S. J. Hensley, who has just returned from a visit to the quartz mine owned by Hensley, Phillips & Lang, on Spring gulch, in the Indian creek district, that the future prospect for the mine is very flattering. Two men are now working on the ledge and have sunk to a distance of about 50 feet, and in doing so, have taken out about 20 tons of good-looking rock, which will average about \$20 to the ton. When first discovered, the ledge was only three inches in width, but now at a depth of 50 feet, is 16 inches wide, and lies between well-defined walls. For awhile the work will be confined to the development of the ledge, and after a sufficient quantity of quartz is piled on the dump, means will be employed for crushing it.

A NEW MILL FOR NEW RIVER.—*Humboldt Standard*, May 20: A quartz-mill is now in readiness to be packed over the mountains from the east side into the New River mines. It is the property of J. S. Thomson, Harry Smith and Mr. Shulford, and will be put up on Slide creek, just below New River City, where there is ample water to operate it. The owners propose to work ore from the Carrie mine, which lies near the Hard Tack and Ridge-way mines. This mine has a large, well-defined ledge, and the quartz is reported rich. The mill will be packed in just as soon as a train can get over the mountains.

RICH STRIKE.—*Redding Free Press*, May 21: At the Bank of Shasta County can be seen some rich specimens of quartz, taken from a mine at Minersville, Trinity county, owned by Tourtelotte, Smith, and Bauer. Coarse gold seems to be spread all over the surface of the rock, which resembles the quartz taken from the Scherer mine, in fact one can scarcely tell the difference between it and the Scherer rock. The owners have a rich claim.

Ventura.

LEXINGTON CO.—*Ventura Free Press*, May 21: Everything is livelier now than before. Prospectors continue to arrive. Smith & Grover are at work on the Exchange, and have splendid indications. Ralston & Archibald are opening their claim, the Mammoth. Campbell & Foley discovered a rich ledge in Long Dave canyon, and have sunk a 30-foot shaft on the ledge, which yields some of the finest samples of carbonate ores yet discovered in the camp.

NEVADA.

Washoe District.

CALIFORNIA AND VIRGINIA.—*Enterprise*, May 22: On the 1300 level the drift running northeasterly from the north drift from west crosscut No. 1 was advanced 34 feet; total length, 117 feet. On the 1200 level the south drift, entering from the Ophir mine, was extended 30 feet; total length in Con. California and Virginia ground, 150 feet. On the 1400 level west crosscut No. 1 from the south drift was extended 40 feet; total length, 74 feet. Continue extracting ore from the new south stopes as usual. The injection of carbonic acid gas into the bulkhead portion of the mine is still steadily continued. During the week 79½ tons and 860 pounds of ore were shipped to the Morgan mill, 1750 tons and 1740 pounds to the Eureka mill. The average assay value of all the ore worked at both the above mills during the week, according to battery samples, was \$32.83. Bullion of assay value of about \$71,000 is on hand in the assay office. Shipped to San Francisco, May 16th, bullion of the assay value of \$79,751.92.

GOULD AND CURRY.—On the 300 level the main west crosscut was extended 21 feet; total length, 183 feet. At a point in this crosscut, 140 feet west from the upraise, a north drift was advanced 15 feet in quartz. From the upraise in the old stopes, 50 feet above the 300 level, are drifting in various directions and finding some ore. On the 625 level the east crosscut from the main south drift was advanced 29 feet; total length, 272 feet. The face is in hard porphyry. The winze was sunk 18 feet; total depth, 49 feet. The bottom is in quartz and porphyry. Repairs are in progress in the two north compartments of the main shaft.

BEST AND BELCHER.—On the 800 level west crosscut No. 4 was extended 22 feet, making the total length 426 feet. The face is in porphyry and quartz, showing value by assay. On the 1300 level a station is being excavated. On the 1500 level east crosscut No. 1 is stopped. No. 2 was advanced 68 feet; total length, 785 feet. It is passing through porphyry showing clay and fine lines of quartz.

OCCIDENTAL.—In the upper tunnel on the 48 level the south drift from the north incline winze was extended 11 feet; total length, 230 feet. In No. 3 east crosscut the incline winze was sunk 11 feet; total depth on the slope, 85 feet. From the winze and the south drift extracted 24 tons of ore.

MEXICAN AND UNION CON.—On the 1300 level the joint Union and Mexican drift running northeasterly, was extended 25 feet. This drift is now 560 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 22 feet; total length, 455 feet.

SIERRA NEVADA.—On the 520 level west crosscut No. 9, from the north lateral drift No. 2, 160 feet south from west crosscut No. 1, was extended 58 feet; total length, 341 feet. The face is in porphyry, quartz and clay.

UTAH.—On the 472 level the north drift from the main west drift was extended 40 feet; total length, 705 feet. The face continues in vein porphyry,

passing through clay slips, and is showing moisture.

OPHIR.—On the 1300 level, north winze No. 1 was sunk nine feet. It is showing low-grade ore in the bottom and old stope timbers of the east side.

Aurora District.

PROSPECTS.—*Esmeralda News*, May 21: Aurora, once a scene of excitement and prosperity, is about to resume its former place in the catalogue of bullion-producing camps. For years it produced annually millions upon millions of gold. The place, on account of the merit of its mines, was known and heard of everywhere, but owing to the unsettled state of titles to mining property at that period, involving disputes, the camp received a set-back which it has taken time to efface. Now that transportation facilities to and from Aurora are more convenient, the titles to the mines settled by possession considered valid and by patents issued to owners by the United States, together with the intrinsic value of the mines of that district, an era of prosperity is assured. The hills and mountains surrounding the pleasant town of Aurora abound in veins of gold and silver ore of all grades; in fact there are quantities, beyond estimate, of free-milling gold ore which can and will be worked to a profit. Aurora continues to merit its old reputation for rich and highly productive mines in gold and silver. The owners of the Silver Lining are jubilant over the prospects of their claim. The quantity of ore in sight in the Silver Lining is so great as to render it beyond calculation. The company tried to obtain a lease of the Silver Hill mill, but was unsuccessful, and now has commenced the grading for a 10-stamp mill at Gregory Flat. Last Wednesday, John W. Gray, superintendent of the Silver Lining, came down from Aurora on his way to San Francisco to meet his company, relative to the more extensive operation of the mine and the erection of a mill. It is thought that the company will remove a mill from Bodie and place it at the Gregory Flat site. The litigation which has prevented operations on the Prospectus and Eighty-five lodes being almost settled, it is confidently expected that ex-Governor Blaisdel will have these mines extensively worked.

Como District.

STRUCK THE LEDGE.—*Virginia Enterprise*, May 22: The ledge on the 200 level of the Como-Eureka mine, at Como, has been struck. It is on an average four feet in width, and some of the finest-looking rock ever taken from that mine is now being hoisted. The company will start the mill the first of next week, and will run through about 10 tons per day.

Eureka District.

ORE.—*Eureka Sentinel*, May 21: Some fine-looking ore is being sent to the furnaces from the Alexandria mine. Joe De Jou has struck ore in the Whip-Poor-Will mine, on Prospect mountain, that assays \$240 per ton. The Silver Lick mine is still panning out high-grade ore. This mine is one of the "old reliable" kind. Mitch Gregovich and Mike Murphy, who have been running a tunnel in the Ozark mine, on Prospect mountain, have struck a hozy of ore. It was rumored on the street yesterday that the contractors in the Ruby Hill tunnel had struck a vein of very good ore. The Rescue mine at Silverado has been leased to Jerry McMahon & Co. for one year. The lessees are excellent miners, and will no doubt make money out of their new venture.

ORE SHIPMENTS.—*Sentinel*, May 22: During the past week ore shipments were made from the mines of the district to the Richmond works: Adelphi mine, 6 tons; White Pine, 5 tons; Rescue, 24 tons; May, 7 tons; Jackson, 43 tons; Volk, 2 tons; Bay State, 27 tons; Roslin, 7 tons; Members, 8 tons; Geddes & Bertrand, 16 tons; Silver Lick, 10 tons. Eureka Con., Ruby Dunderberg mine, 75½ tons; Rives & Berry, 29½ tons; Morey, 1 ton; Summit, 13½ tons; Hamburg, 32½ tons.

Gold Run District.

PLACERS.—*Silver State*, May 24: Judge Bonfield and Paul Pison have the ditch completed to their placer mines in Gold Run district, and have commenced washing for gold. They think the diggings will average from \$2.50 to \$4, and possibly more, per day, and they want to give white men a chance to work them so long as the water lasts. The dust is fine but round and resembles that produced in many parts of California in early days. They have been to considerable expense building a ditch, but they think they will get their money back next winter when water is plenty.

Philadelphia District.

SILVER.—*Belmont Courier*, May 22: Green Aldrich has discovered rich ore in his claim, adjoining James Laity's claim, in East Belmont. The discoveries made in Laity's and Aldrich's claims show that rich silver ore can be found in Philadelphia district by prospecting for it.

Red Canyon District.

GOLD.—*Virginia Enterprise*, May 22: A Comstock, who has been taking a look at the Red Canyon gold mines, speaks well of them, and has some notion of returning and prospecting for a month or two. Five or six mines are now being worked with very good results.

Revelle District.

BULLION.—*Belmont Courier*, May 22: The Revelle mines are looking well, and the Gila mill is now crushing the ores extracted from the mines of that district. The Norris Bros. shipped a bar of bullion on Wednesday last, and regular weekly shipments will be made from now on. The Clarke furnace will be completed in a short time.

Sprucemont District.

LIVELY.—*Belmont Courier*, May 22: Sprucemont is about the liveliest camp in Eastern Nevada just now. The big smelter is running, and nearly 200 men are engaged in the district.

Tybo District.

PRODUCING.—*Belmont Courier*, May 22: There are about 35 men at present in Tybo, the majority of whom are engaged in mining. The mines are producing ore in good quantities, which is being hauled to the mill for reduction.

Tuscarora District.

BELLE ISLE.—*Times-Review*, May 21: Crosscut east, 250-foot level, has been advanced five feet; rock very hard.

NORTH BELLE ISLE.—The north gangway from the south end line has been extended 21 feet.

Quite an increase in the flow of water is noticeable in the past few days.

NAVAJO.—Fair progress has been made with the work on the 350-foot level. The south drift from the Johnston crosscut has been extended 11 feet.

NEVADA QUEEN.—During the week the shaft has been sunk 14 feet. Water not strong, only 10 tanks per hour. North gangway has been extended 40 feet; rock is changing to hard blasting; water seeping through the face. Seventy-foot level has been advanced 11 feet. This drift has to be timbered. Machinery is running nicely.

ARIZONA.

MOHAVE COUNTY.—*Miner*, May 21: Stopping is now going on at the American Flag, and the ore now coming out is better than ever. The sampling works people shipped four carloads of ore from Prescott to the smelter last week. The parties who are running the jiggers on the American Flag dumps are making money hand over fist. The C. O. D. sent down their regular carload this week, which ran higher than any yet taken from the mine. The Illinois mine belonging to the estate of Ormsbee Groom, deceased, has been sold to Ed F. Thompson. Frank Robinson brought in a lot of gold ore from some new locations in the Weaver district, which went very well. Dave Parks is running a sawmill on the American Flag mine, and getting out a lot of timbers and slabs for use in the mine. Messrs. Fogarty & Morrissey, who have leases on mines in the Todd basin, both had small lots of ore worked during the week. J. J. Jerome is in town from Cedar district, and tells us that teams will be in this morning with a lot of ore from the Arnold mine. Ike Conkey and Anson Smith are prospecting in the Wallapai mountains, and have sent in word that they have struck the biggest thing in the country. Beecher & Co. received a lot of leaching tanks yesterday for O'Brien & Meara, who are going into the leaching business in the Weaver district near El Dorado canyon. Jack White has made a big strike on the Democrat mine at Wallapai mountain, which consists of a six-inch streak of ore averaging about \$350. The Democrat is the south extension of the Antelope mine. J. F. Maher, who is concentrating the dumps of the American Flag mine by means of jiggers of his own contrivance, sent down his first lot of concentrations last week. On the Greenhorn mine, at Wallapai mountain, Messrs. Allyn, Sherman & Co. are taking out more and richer ore than ever. They have now about 14 to 18 inches of pay streak, in which is a small streak of about an inch, which is the pure stuff, and can be whittled with a knife as easily as a piece of pine.

A NEW STRIKE.—*Phoenix Herald*, May 20: The elated of the Phoenix mine strike has been succeeded by one that bids fair to bring Cave Creek district to the front as a rich camp. The Gray Bros., who own the Golden Chief mine, resumed work some two months ago, and at a depth of 55 feet came into a fine body of sand-carbonate ore that has held out up to the present time, at a depth of 90 feet the ore filling the waist of the shaft, and how much more in the south wall has yet to be determined by cross-cutting. The average assays from the recent tests run from 35 to 100 in gold, and from 30 to 60 in silver. The mine is well situated, being at the base of the Apache Spring mountains, facing the desert of the Winnefred, where is located the Union and Scarlet, both promising gold mines, now operated by a St. Louis company which has proved its property good by a shaft 400 feet in depth and several hundred feet of drifting. The sand-carbonate ore of the Chief, however, being in the district a new character of ore, resembles the ores of Tombstone, in the Contention, Tough Nut, and Head Center mines. The new railroad crosses the south end of this mine, it being two miles from Cave creek, westerly. Its situation makes it an easy mine to work, the country being almost a dead level and wood and water plenty.

TOMBSTONE NOTES.—*Democrat*, May 22: The Grand Central shaft is timbered down 60 feet, and the sinking is progressing. The excavation is completed for the hoisting engines. The Girard-Dipper shaft is down and timbered to a depth of 205 feet. Drifting on the ledge has been discontinued for the present. The Boss looks fair and promising. The station on the 300-foot level is about finished, and the coming week will see drifts started north and south on the ledge. The Silver Thread continues to yield well. The output for this month will probably exceed \$12,000, which is fair for a small mine. The Chance shaft is down 216 feet. The rich ore at 70 feet continues to hold out as good as ever. This is one of the most promising little mines in the district. An engine will soon be erected on the Jonathan, and the incline opened up into a double compartment shaft. The Maine looks well in the upper stopes and somewhat more satisfactory in the drifts on the 500-foot level. The boys at the Mamie continue to find chloriding a most profitable pursuit. It will be fully a month before the pump is in place at the West Side. The mill will then start up and work will be resumed at the mines.

COLORADO.

REDWELL BASIN.—*Elk Mountain Pilot*, May 20: A trip to Redwell Basin last Saturday satisfies us that the trail will be open for pack-animals about the 5th of June. The tunnel being driven to tap the Daisy group of claims, and particularly the Daisy lode, has now reached a depth of 370 feet and is still being pushed ahead. They expect to run at least 50 feet further before reaching the vein. The Yellow Jacket lode, in Redwell Basin, is being worked by the owners, Dunbar Bros. The claim is developed by a tunnel on the vein 75 feet long, which is still being driven ahead. The ore is iron, copper, and galena; principally the latter, and is of a very fair grade. The Bullion Prince, in Redwell Basin, and owned by Wiltsee, Stevens, and Riggs, is now being worked by the latter. The lode is developed by two tunnels, one 30 feet in length and the other 112 feet. The latter, which is lower down the hill, cuts the vein at 65 feet, and from thence continues on the vein, which averages about six feet wide. Along the hanging-wall is a body of ore that Mr. Riggs styles hard carbonates. On the foot-wall is a body of ore of similar characteristics, only quite soft. It is in the lower tunnel that work is now being carried on. The Bullion King shipped a car of ore to Gunnison this week.

IDAHO.

BULLION.—*Cœur d'Alene Record*, May 14: Sunday, Assayer Lougee melted the product of 10 tons of Mother Lode quartz, crushed by the arastra, and obtained a bar of fine gold bullion weighing between 32 and 33 ounces and valued at about \$570. Supt. Coulter, of the Cœur d'Alene Water & Mining Co., expects to begin hydraulic work at the Raven placers early next week. A strike of lead ore was made on Old Baldy a few days ago, on the east or north fork of Eagle creek, below the Golden Dawn and Ocean groups. Development may bring to light a big ledge of galena. Frank Reed has had the flume and tail-race of the Chapman arastra, opposite the mouth of Drenn gulch, cleaned out preparatory to starting it up on "Jim Blaine" ore next Sunday or Monday. Men are now at work building a road up Dream gulch to the new discovery, which is a chimney of very rich gold ore within the Jim Blaine lines, south of the Homestake, and about 300 feet above the Buckeye. The find was made ten days ago, about 100 feet from where Mr. Reed first found float in 1883. A tunnel has been run in 20 feet and now shows four feet of solid ore in the face, which is said to fairly bristle with free gold. The ledge is the same as the Homestake and runs parallel with the Buckeye. The ore will be roasted at the mine and then hauled down to the arastra in wagons.

WOOD RIVER.—*Ketchum Keystone*, May 21: A number of new faces now daily appear on the streets. Many are those of miners who are returning after an absence during the winter, while others are here looking up mining interests and opportunities for investment. Wood River and her wonderful mineral resources have of late attracted general attention, and the continued improvement in several of the leading mines has impressed many with the fact that a better field for investment in mines could not be found. The ores of the Minnie Moore and Idahoan mine have been contracted for by the Omaha Smelting Works. The Queen of the Hills had a contract to deliver 1000 tons at Omaha, but did not succeed in making a contract for the output of the season. It is stated that the ore from the mine is now being sent to the Selby Works in California.

THE WEST FORK.—Those who remember the rich strike made in 1881, at the West Fork mine, and the large body of high-grade ore then taken out, are not a little interested in the report current now of another strike having been made in the same mine within the past few days. Work has been steadily carried on, and while as yet the new ore body found is of no considerable size, it is sufficient to give prospects of a large bunch being found, and in any event will lead to a vigorous prospecting of the property. This is the first ore found in the mine in over five years, during which time thousands of dollars have been expended in development work, carried on unremittently at times when the outlook would have disheartened the most of men called upon to furnish the means to prosecute the work. Additional men were put to work during the week, and the latest authentic report from the mine was that the body of ore was gradually increasing in width.

AT THE SAMPLER.—Workmen are engaged in building an addition to the sampling-mill, the enlargement being necessary to accommodate the new machinery soon to be put up, and the increase of business. The west end of the mill will be extended 20 feet and an office and plate-room will be put in the space between the track and building. The Cornish roll and automatic machinery is expected to arrive here next month. The receipts at the sampler during the week were light, embracing about 18 tons from the Elkhorn mine and 10 tons of Independence ore. A lot of ore from the Allen group of mines is also expected to-day.

A NEW GOLD BELT CLAIM.—*Wood River Times*, May 18: S. S. Cass to-day brought in some samples of horn silver ore, which he extracted from his ledge out on Rock creek. They came from the Gleaneriff, a new claim, which he and Dan Twobill located a short time ago, on what is supposed to be an extension of either the Donovan or the Ohio and Ornament ledge. A shaft is down on the ledge 20 feet, and shows the vein to be five feet between walls—of which five inches is black sulphurets and horn silver, which assays \$1300 per ton, and 14 inches is ore going 100 to 150 ounces silver per ton. The Gleaneriff is owned by S. S. Cass and Dan Twobill, of this city, who propose to push developments as rapidly as possible.

MOTHER LODE.—The lower tunnel on the Mother Lode, at the water-level where the famous slab lies, is in about 75 feet, the first one above it about 120 and the second above about 130, an aggregate of 325 feet. A connection is now being made between the second and third tunnels, near the face of the former. The ore continues as rich as ever, and the ledge widens gradually as depth is attained. Several men are employed in one of the upper tunnels of the Idaho; a few are working at the mill, and a small force is engaged in clearing out the lower tunnel, below the mill, the mouth of which caved in a few weeks ago.

THE SHIPPING SEASON.—*Wood River Times*, May 18: The shipping season opens this year, in this region, with a more promising outlook than ever before. The Minnie Moore, Queen of the Hills, Relief, Commodore, Climax, Idahoan, Eureka, Carrie Leonard, Silver Star, King of the West, Galore, Tyranniss, Emery, Bullwhacker, Nay Aug, Montana, Snow-Fly, North Star, Triumph group, and the large number of other producing mines will all increase their yield, and where tons have been shipped heretofore, carloads will now be marketed. Before the close of the season it is probable that the daily shipments of ore and bullion from our galena mines will average 10 carloads.

EAST FORK OF WOOD RIVER.—Ole Oleson, who has been developing the S. J. Friedman Lucia claim, on one of the tributaries of the east fork of Wood River, says that, from present appearances, fully 100 men will find employment on the east fork this year, and that in a year or two, unless he is greatly mistaken, that region will be one of the most important on Wood River. The Lucia vein is showing up encouragingly. The workings so far have developed a vein averaging six inches of ore, worth an average of 100 ounces per ton.

FLINT.—*Idaho Avalanche*, May 21: We understand that a large ledge of very rich ore has been found in the Perseverance mine, at Flint, some of

which runs up into the thousands in assay value. This rich ore was found in the bottom of the shaft on that lode. Rich ore has also been found in the Rising Star lode, some of which assays \$6000 per ton. Good ore is also being found in other lodes in that camp, owned by individuals. From present appearances, Flint has a bright future. Messrs. John F. Sullivan and Isaac Phillips have discovered a large quartz lode several hundred feet west of the Black Jack, which contains fine milling ore in large quantities. The lode has just been discovered, and as yet but little is known about it, except that it is large and the ore good. The Idle Wild mine, on War Eagle mountain, never looked better than at the present time. The shaft is 250 feet deep, from the bottom of which levels have been run in good ore.

MONTANA.

STRIKE.—*Anaconda Review*, May 20: In regard to the strike in the Katy Darling mine, which was reported in this paper last week, there have been no further developments. The rich vein of ore, which was struck, is about eight inches in width, and apparently leads directly into a large body of ore. The owners of the mine are feeling pretty lucky. From C. H. Moore, superintendent of the Pyrenees mine, we learn that the Pyrenees mine and mill are now running full blast. There are 35 men on the pay-roll, and the mine looks better every day. The Southern Cross mine, at Georgetown, owned by Salton Cameron, is being worked by A. Wartenweiler and H. Bratnoher, under a six-months' bond, which will expire next month. They have a number of men at work on the property. Four men are now at work in the Luxembourg, owned by Salton Cameron. This claim adjoins the Pyrenees on the side where that mine is growing richer. Parties down from Phillipsburg report all the mines in that district running at full blast, and that the whole camp is on the boom. Snow has fallen heavily in the past two weeks, however, and this interferes with the operations of prospectors and small mine-owners. In conversation with a representative of the *Review* a short time since, a prominent mining man of Butte said he considered the mineral belt, just back of Anaconda, as the most promising country in Montana. He even went so far as to state that he believed the time would come when these mines would be of more importance to the town of Anaconda than the great smelter. While this view is probably a little too rosy, the statement is still within the range of possibility. The developments of this mineral belt this summer will be a great surprise to all but the very few who are posted. Mining operations at Silver Lake are still impeded by the heavy snow.

OREGON.

ALTHOUSE MINES.—*Rogue River Courier*, May 20: Richardson & Gilmore have cleaned up and ceased operations for the year. Barnett & Dickey cleaned up their winter's run and went over to their summer diggings on Indian creek, where they will work during the dry season. Jas. Turnbull has struck good pay in his tunnel on Althouse. He was running a drift to strike an old channel, and after a long time has succeeded, and is well rewarded for his expense and delay.

UTAH.

FRISCO.—*Southern Utah Times*, May 19: The Horn Silver shipped four cars of ore this week. George Hardy shipped a carload of matte last week. The Grampian is improving as developments are being made. Charles Lammersdorf's surface mine is being worked on a limited scale while silver is so low. J. H. Hedge's great sulphur mines are, without doubt, the richest in the country, and offer a fine field for profitable investment. Grace & Lipscomb, in the development of their mine 18 miles south, encounter some pieces of fabulously rich Horn Silver ore. Kruse Bros., Poudler & Kaas, are now down 150 feet on their mine, two miles north of Camp. They have encountered ore, and the prospects are promising for the uncovering of a paying mine. There is some talk, on the outside, of the Horn Silver Co. sinking a shaft on its north extension. We hope this will be done, as it would tend to give a new impetus to mining in this district. We doubt, however, if the present star-chamber management will ever do so sensible a thing.

STOCKTON DISTRICT.—*Cor. Salt Lake Tribune*, May 22: The mines about Stockton never looked better than now, and yet there is so much undeveloped ground that it is not unreasonable to predict a great future for the camp. Ophir district can be reported as only partially active. Men who have long been with the camp and have good claims only partially developed are doing what their limited means permit, and hold on with a strong faith of final success. On Lion Hill the Brim Bros. are working several claims and are making small shipments of ore. They speak of a concentrator as one of the great needs of the camp, and they may put one in for their own ores, and to do custom work. Mr. Lineback has a good property in the foothills near the mouth of Ophir gulch, from which he makes small shipments of high-grade ore. On Lion Hill there are large ledges of ore carrying silver and gold in pyrites, which would pay if cheaply roasted and used in connection with ores needing this class of fluxing material. About all the claims around Ophir are being represented from year to year, and that is about the extent of the work done on most of them.

REVIEW.—*Salt Lake Tribune*, May 20: The receipts in this city for the week ending the 18th instant, inclusive, were \$115,550 in ore and \$69,882.34 in bullion, a total of \$185,432.34. For the previous week the receipts were \$109,804.82, of which \$60,250 was ore, and \$49,554.82 was bullion. The Ontario product for the week was silver bullion, 23,112.67 fine ounces; ore sales, \$31,698.17; a total of \$54,810.84, approximately. All is going on as usual with this immense property. The Daly output for the week was seven bars bullion, 10,477.10 fine ounces; no ore sales. Fine bar receipts for the week were to the value of \$10,500; base bullion, \$7200. The product of the Hanauer smelter was for the week, \$33,900 in bullion. The Horn Silver of Frisco is shipping some lots of ore from time to time, but the public can get no idea of the value of it. Ore receipts in this city for the week were to the value of \$37,700 by Wells, Fargo & Co., and \$77,850 by McCornick & Co., including \$2050 Crescent,

COMPRESSED AIR and WATER POWER MACHINERY.

RIX & FIRTH, 18 and 20 Fremont St., San Francisco.

NATIONAL AIR COMPRESSORS.

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied. At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet. All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco. Certificates as to performance of the Mills, and any information required, furnished on application.

Sectional View of Pulverizer.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

PNEUMATIC PULVERIZER COMPANY,

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, nodercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, 35, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

Engraving Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of this paper.

Mining Share Market.

Stocks have not held up so well this week as was expected from the advance of last week. Insiders, however, expected this drop, and say there will be another slight rise before a regular excitement sets in.

In speaking of what it calls "the boom to come," the Virginia Enterprise says: We shall not only have the old bonanzas and the north end, but the middle mines will also stand in good and strong. The Chollar and Potosi will make things lively when they begin hoisting and milling ore. At the Chollar they are prospecting on the 100, 250, 350 and 450 levels. On these levels they are now running no fewer than ten exploring drifts and crosscuts. In these they are now opening up some fine deposits of ore. The ore taken out in making these explorations is stowed away in the openings below, only enough being dug down to show the extent and value of the deposits cut into.

An important connection soon to be made will be that between the 450 level of the Sharon shaft, at the croppings of the vein, and the 450 station of the old Chollar shaft. The drifts between these points will soon meet. The connection will not only afford a fine circulation of air, but will also give valuable working and prospecting facilities.

At the Savage next week will be opened a new working station at the 700 level. The winze from the 600 to the 700 yesterday had only 10 feet to go to the point where the station is to be made.

A very important connection has just been made between the north drift on the 1200 level of the Norcross and the ninth station (1200 level) of the Savage. The draft of air is down the Norcross and up the Savage shaft, and is almost strong enough to blow a lantern out of a man's hand. This drift is a large one and is fast cooling off all the middle mines.

On the 1300 level of the Chollar, in December last, in an east crosscut, a body of first-class milling ore was cut into a distance of eight feet, when work was discontinued. The width of this deposit is unknown. Now that the big drift is cooling off, all this part of the mine work at this point might economically be resumed and the deposit fully explored.

The lack of the connection just completed was the last thing in the way to the full and perfect exploration of a very large area of virgin ground that has long been lying untouched in the middle mines. They may now prospect all the way through from mine to mine, and it is expected that the work will soon be commenced.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court Department to, San Francisco:

LONE STAR G. M. Co., May 21. Location, El Dorado Co. Capital stock, \$5,000,000. Directors, J. C. Heald, Geo. W. Miller, M. H. Gibson, G. Rich and G. W. Bibbens.

NEWARK G. M. Co., May 21. Location, Cal. Capital stock, \$400,000. Directors, T. E. Jewell, E. M. Smith, W. Holt, D. B. Arthur and W. B. Murdoch.

MONTEZUMA G. M. Co., May 21. Location, El Dorado Co. Capital stock, \$5,000,000. Directors, J. C. Heald, Geo. W. Miller, M. H. Gibson, G. Rich and G. W. Bibbens.

UNION PAPER CO., May 21. Capital stock, \$10,000. Directors, M. P. Vandewater, W. D. Witham, A. G. Towne, J. E. Watson and C. Maginnis.

BORLAND KILN CO., May 20. Object is to purchase, own and operate patents for a hot-air, automatic grain and malt-dryer. Capital stock, \$75,000. Directors, Louis Borland, Thomas J. Parsons, Geo. Cottrell, F. J. Meckfessel and Frederick Meckfessel.

AMERICAN BISCUIT CO., May 20. Capital stock, \$1,000,000. Directors, Louis Sloss, Lewis Gersile, Isaac Wormser, Thos. Jennings, Isaac Trumbo and James Moffitt.

ROCKLAND LIME & LUMBER CO., May 20. Capital stock, \$100,000. Directors, Jas. S. Hanly, Wm. H. Goodell, Louis S. Snow, James F. Chapman and Francis Cobb.

FORTY-NINERS' HOPE M. & M. Co., May 20. Location, California. Capital stock, \$100,000. The directors are Charles Hinsberg, F. H. Busby, G. W. F. Cook, E. H. Rhodes and Wm. Grant.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

New York Metal Market.

Telegraphic advices dated May 26th give the following New York prices:
BAR SILVER—91 3/4 per oz.
SILVER—64 @ 64c.
COPPER—LARS—\$10 40.
IRON—No. 1, \$22.00.
LEAD—\$4.30 @ 4.35.
QUICKSILVER—63 @ 64c.

The following is the latest by mail from the "New York Metal Exchange Market Report":
COPPER—Steady, spot, closing at \$9.96 @ 10.00. Transferable Notices (Chili Bars) issued at \$9.96 @ —. Transferable Notices (Chili Bars) issued at \$20.65.

LEAD—Firm at \$4.45 @ 4.50. Transferable Notices issued at \$4.74.
TIN—Quiet at \$22.70 @ 22.90. Transferable notices issued at \$23.30.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.
Australian Tin, \$22.90 @ 23.25; Billiton Tin, \$23.60 @ 24.00; Banca Tin, \$23.60 @ 24.00; Baltimore Copper, \$9.96 @ 9.98; Orford Copper, \$9.90 @ 9.95; P. S. C. Copper, \$10.00 @ 10.25; Foreign Lead, \$4.45 @ 4.70; Foreign Spelter, \$4.70 @ 4.75; Antimony, \$7.60 @ 7.70.

MAKERS' PRICES—At tidewater. 100-ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$20.50 @ 21.00; No. 2, \$19.50 @ 20.00; Gray Forge, \$17.50 @ 18.00; Hudson River, Grade No. 1, \$20.50 @ 21.00; No. 2, \$20.00 @ 21.00; Gray Forge, \$17.50 @ 18.00; No. 2, \$21.00 @ —; Gray Forge, — @ —.

Our Agents.

Alice, 20, \$32,784; Marget Ann, 19, \$64,488;

18, \$55,601; 19, \$55,550; Bannock, 19, \$13,000; Hanauer,

19, \$49,251; 21, \$23,200; 22, \$47,000.

Anderson Springs.

We have seen hundreds of guests at this well-reputed resort who have benefited by its health-giving springs and baths, and delighted with the cheerful home comforts, good and abundantly supplied tables. Do not fail to visit Anderson Springs when in search of health and recreation. New cottages and improvements have been added to the place during the last few seasons. See announcement in our advertising columns.

For Sale.

State and County Right to a Fly Trap, warranted to keep your house free from flies. Send stamp for particulars to Z. Xovers, 208 Brannan St., San Francisco, Cal.

About Obtaining Patents.

Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously patented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however, and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first fee-toll of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us to the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds \$40, and for this we do all we can without appealing the case.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in lubricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bank of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public who the patent is granted.

Advantage to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 26 years. Few agents who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications entrusted to their care; and their familiarity with inventions and with local affairs to the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily—when distant agents are employed—is wasted in preliminary writing back and forth.

This happy combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee is \$10 additional.

To enable us to prepare caveat papers, we require only a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 108 12mo. pages, with illustrations, well bound in cloth, 1884. Price, \$1. Postpaid, Sold by Dewey & Co., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assay; Parkes' Process; Amalgamation; New Process; Preparation of Polars; Zinc; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assay; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound in cloth. Price postpaid, \$1.75. Sold by Dewey & Co., Publishers, No. 252 Market St., S.F.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulae Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated, and Expressed in Formulae and Rules; Flow of Water through Openings; Flow of Water through Pipes; Flow of Water through Short Tubes and Compound Tubes; Flow of Water through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend, Circular and Angular; Flow through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, \$2.00, post-paid. Sold by DEWEY & CO., Publishers, 252 Market St., San Francisco.

To Every Pump Maker, Owner! Runner! Agent!

If there is ANY PRACTICAL QUESTION concerning ANY APPLICATION or ANY ADJUSTMENT of ANY KIND of a PUMP which is not answered in Mr. ROBERT GRIMSHAW'S PUMP CATECHISM, we would like to have it for answer in the next edition or volume.

The Author will answer any such question in our columns, if addressed in our care, by a regular mail subscriber to our paper. "Catch" questions invited, if they have a practical bearing.

"Tells, for instance, how to put entirely together, set up, adjust, and run all the leading pumps in the market. This information can be had in no other shape or place. Price of the book, post-paid, only \$1, and worth \$5.

DEWEY & CO.,

220 Market St., S. F.

Steam Engine Catechism.

A SERIES OF DIRECT PRACTICAL ANSWERS TO DIRECT PRACTICAL QUESTIONS—MAINLY INTENDED FOR YOUNG ENGINEERS AND FOR EXAMINATION QUESTIONS.

—BY—

ROBERT GRIMSHAW, M. E.

This book is intended to answer not only "such direct questions as have been asked by both theoretical and practical men," but "questions chosen with the view of saving the reader a long search after some point, and enabling him to get directly at the information desired." Formulae and mathematical gymnastics are avoided. While the book is not written for professional men, it is technically correct and up to date. Published in two parts. Price of each part, \$1, postpaid.

Part II of the STEAM ENGINE CATECHISM contains answers to further practical inquiries received since the issue of the first volume. Sold by

Sacramento Office, Cor. N and Front Sts. SACRAMENTO, CAL.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 150 pages, embracing illustrations of furnaces, supplemental and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, coin, postage free. Sold by DEWEY & CO., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by Dewey & Co., S. F.

ATTENTION, MILLWRIGHTS!

A BOOK YOU ALL WANT.

Lefell's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.

A STANDARD WORK.

This practical work of 238 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Plans have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dam now in use, with a complete description as to their mode of construction. Mill owners will find this a valuable work of reference. Beside complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.

Price 50 cents, post-paid. For sale by DEWEY & CO., 252 Market St., San Francisco, Cal.

Patent Agency:

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and references library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in this MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

THE JUSTLY FAMOUS

Anderson Springs

Are beautifully and delightfully located in a grand natural park, with fine large groves of forest trees, gurgling trout brooks, and the greatest variety of valuable mineral springs known in any one locality, including hot iron and sulphur springs and a cold iron spring.

These springs have been well established for years by the present proprietors, who furnish

Excellent Board with Good Home Cooking.

Good care is taken to make living at the hotel and cottages as pleasant and agreeable to all as possible.

The remedial qualities of the springs are indeed wonderful. Excellent bathing in both mineral and pure water, including natural-puffing steam baths.

Board, \$10 to \$14 per week. Children under 12 and over 3 years of age, half price; 2 and 3 years of age, one-fourth price. Route from S. F.: Take morning train to Calistoga, Napa Co., Cal. Stages leave Calistoga daily for Middletown, fare, \$2. Private team to springs, \$1. Express and P. O. address, Middletown, Lake Co., Cal. Write for further information.

J. ANDERSON, Proprietor.

THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all druggists.

Recording Earthquakes.

The Self-Registering Instruments Used.

Few people know the construction or operation of the seismograph, which is an instrument for registering earthquakes. In view of the fact that people on this coast are specially interested in disturbances of the earth, a complete set of these earthquake recorders has been procured for the Lick Observatory, made from designs of Prof. J. A. Ewing, of Dundee. We give engravings of these self-registering seismographs on this page with description extracted from Prof. Ewing's note in *Nature*:

In the design of these seismographs, the object has been kept, in view of making them easily capable of use by observers who have not made seismometry a special study. They are entirely self-recording and require little attention during the long intervals which must, in most situations, be expected to elapse between one period of activity and the next.

One group of instruments is arranged to give a complete record of every particular of the movement by resolving it into three rectangular components—one vertical and two horizontal—and registering these by three distinct pointers on a sheet of smoked glass, which is made to revolve uniformly by clockwork. A single earthquake always consists of many successive displacements of the ground, hence the record traced by each pointer on the moving plate is a line comprising many undulations, generally very irregular in character. The amplitude, period and form of each of these are easily measured, and by compounding the three we obtain full information regarding the direction, extent, velocity and rate of acceleration of the movement at any epoch in the disturbance.

This group of instruments is shown in Fig. 1. In the center is a plate of smoked glass, which gets its motion through a friction-roller from a clock furnished with a centrifugal governor, acting by friction fluid, and balanced so that its speed is not sensibly affected by the shaking of the ground. The clock is started into motion by means of a Palmieri seismoscope, which appears in the figure behind the plate on the right. This is a small common pendulum, whose bob carries at the bottom a piece of stiff platinum wire that projects into a recess in a cup of mercury below—the recess being formed by an iron pin standing lower than the surface of the surrounding mercury. On the slightest shaking of the ground, contact with the edge of mercury takes place, and this closes a circuit which releases an electromagnetic detent and starts the clock. This occurs during the preliminary tremors which are usually found in advance of the main movements of an earthquake. The same circuit starts another clock (of the escapement type), which fulfills two functions: It marks time on the revolving-plate during a part of the first revolution, and then continues to go as an ordinary clock, so that, by inspecting its dial afterward, the interval which has elapsed from the occurrence of the earthquake is known, and the date of the shock in hours and minutes is thus determined with as much precision as the phenomenon admits of. This part of the apparatus is omitted from the figure. The two horizontal components of motion are recorded by a pair of horizontal pendulums set at right angles to each other, but with their indices inclined so that they write side by side on one radius of the plate. The pendulums are sup-

ported on a single stand, but with independent adjustments for position and stability. Each has two pivots, consisting of hard steel points which turn in sapphire centers. At the pivots and at the tracing points every effort has been made to avoid friction. The indices are of aluminium, and a part of their weight is taken by springs (not shown in the figure), so that their pressure on the plate may be no greater than is necessary to produce a trace on the sooty film. The vertical component of motion

recorded, is magnified to an extent which experience of Japanese earthquakes has shown to be desirable in dealing with disturbances ranging from those which are just recognizable as earthquakes up to those which are, to some extent, destructive. For great earthquakes, separate apparatus of the same type is designed, in which the multiplying indices are dispensed with, and the scale and style of the other parts are considerably modified.

Another and distinct instrument is the duplex

FIG. 1.—Complete Three-Component Seismograph, for Motions in all Directions.

FIG. 2.—Duplex Pendulum Seismograph for Horizontal Motion.

SELF-REGISTERING INSTRUMENTS FOR RECORDING EARTHQUAKES.

is recorded by the instrument which appears behind the clock. A massive bar, free to move vertically about a horizontal axis, is held up by a pair of long spiral springs. Its equilibrium is made nearly neutral by applying the pull of the springs at a suitable distance below the horizontal plane through the axis of support, in the manner described in the article, to which reference has already been made. A bell-crank lever with a jointed index gives a multiplied trace of the apparent vertical oscillations of the bar, which correspond to vertical displacements of the ground. In this instrument, as in the others, sapphire centers are used to minimize friction.

Records inscribed on the plate are preserved by varnishing the plate and using it as a negative to print photographs. The motion, as

pendulum seismograph, shown in Fig. 2. A massive bob is hung by three parallel wires from the top of a three-cornered box, and is reduced to nearly neutral equilibrium by being coupled by a ball-and-tube joint to the bob of an inverted pendulum below it. The two form a system which can be made as nearly astatic as is desirable, and so furnish a suitable steady point for the horizontal part of earthquake movement in any azimuth. The motion is magnified and recorded by a vertical lever geared to the upper bob by a ball-and-tube joint supported on gimbals from a bracket fixed to the box, and furnished with a jointed index which writes on a fixed plate of smoked glass. Records of the kind which the duplex pendulum gives are, of course, incomplete in two important particulars; they show nothing

of the vertical motion (which, however, is usually a comparatively small part of the whole), and they show nothing of the relation of time to displacement throughout the disturbance. But they exhibit very clearly the change of direction which the movements undergo, and the actual direction taken by any pronounced element of the shock.

Water-Wheels.

During the past few years more attention has been turned to the use of water for power in the quartz mines on this coast than was previously the case. As a result, improvements in water-wheels have been made. In the early days, what was known as the "hurdy-gurdy" wheel was largely used in hydraulic mines to provide power for removing boulders and rocks. These wheels were to some extent used also in quartz mines. There are several improved forms of these wheels, and among them the Pelton has proved very efficient. The percentage of power utilized in this wheel is found to be much greater than was formerly considered possible.

In conversation with Mr. Pelton, the inventor, a few days since, we learn that not only are these wheels largely used on this coast, but their fame has gone abroad, and he has sent quite a number to South America, South Africa and New Zealand. They were formerly built exclusively at Nevada City, but are now also being made at the Fulton foundry, in this city.

Four of these Pelton wheels have recently been put into the Consolidated California and Virginia mine, on the Cometock. This mine alone will use 4,000,000 gallons of water per day for power purposes. Water-wheels will also no doubt be put into other of the Cometock mines so far as water can be procured to drive them. Arrangements have been made for increasing the water supply. So much of the power of the water is utilized in this form of wheel that it is in great favor wherever it has been tried.

The California stamp and pan-mill on the Cometock are to be run by the Pelton wheels in the mine shaft, the power being transmitted by wire rope. The pulp from the battery-mill will be conveyed to the big pan-mill by means of a large iron pipe. The pan-mill will also be run by power transmitted to it from the C. and C. shaft. The mill is about 1500 feet from the shaft, and a steel-wire cable for that length will be used. This belt will be supported at proper intervals by means of friction-wheels or pulleys. Moreover, it will not run in a straight line. At one point it will be turned to the northward at quite a sharp angle. The big water-wheels can be put into the shaft and all these changes and improvements made in less than three months. It will not be necessary to interfere with the cages or any of the hoisting compartments of the C. and C. shaft, nor to enlarge it. The power will be brought up from the water-wheels by means of steel-wire cables running in the old-pump compartment. All that will be required will be the cutting out of proper stations for the water-wheels and the other wheels or pulleys that work in connection with them.

The Georgetown Gazette says: It is estimated that about \$50,000 worth of gold dust is sold at this place and Georgia Slide during the year. Of this amount, the Chinese sell about one-half.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Coal Mines and Geology.

EDITORS PRESS:—In your issue of May 14th there appears the following paragraph:

"An Annot, Pa., miner took out a piece of sulphur a few days ago, which was a perfectly formed ear of corn, the kernels and rows being very distinct. It was under 20 feet of solid rock, and in the middle of the coal vein."

With the casual reader the fact stated in the foregoing paragraph has little significance; but those who give that subject careful attention will perceive that it has a very important relation to the science of geology. Professors of that science teach that during the carboniferous or coal-producing period of the earth's history, the climate, the vegetable and animal life were extremely different from what is at this time existing; that the atmosphere was then so largely composed of carbonic acid as to produce a vegetation much exceeding in redundancy anything now existing, but at the same time precluding the possible existence of any of the higher forms of animal life. That the entire surface was continuously blanketed (so to speak) with a vaporous covering causing a climate of extraordinary warmth and moisture, in which tree-ferns were the principal growth, there being no flowering plants of any kind other than some few cone-bearing trees remotely allied to the pines of the present time. That such a climate was uniform, and caused the same kind of productions. "From the Bolivian Andes to at least the 76th of latitude, probably to the poles." Now, in contradiction of what has been assumed in this regard by geologists, the finding of this imprint of an ear of corn proves that at the time this Pennsylvania coal was formed there certainly was at some places a climate the same as that now existing.

I have personal knowledge of another fact, which proves that the same is true of coal deposits on this side of the continent. In sinking the shaft for the opening of the mine at Nanaimo in British Columbia, where the disastrous explosion so recently occurred, there was found the imprint of a perfect palm-leaf, three feet in length. This was sent away to Eastern Canada before I knew of its having been found; but I afterward procured a beautiful specimen of the same kind, embracing about half the length of a leaf. Associated with it were a variety of other small leaves of deciduous trees.

Geologists also teach that coal is the result of vegetable growth directly in place where the beds now lie. That where there are a series of veins on above the other, each vein represents an oscillation of the land level; that is to say, the land must remain above the water long enough to produce a growth sufficient to form the vein of coal, then has sunk beneath the water to get its proper covering of earth. Then it must rise again to receive another growth of coal material. Geologists have assumed that in the formation of coal each foot in thickness of the vein, and also of the inclosing rock, represents a period of about 1000 years. The coal which is being mined at Nanaimo has in some places a thickness of eight feet. The shaft which reaches the coal where this recent accident occurred has a perpendicular depth of 600 feet; consequently the two taken together on that basis will represent a period of more than 600,000 years.

In a stone quarry on the surface, not far from this shaft, I have seen as many as four distinct seams of coal as perfect as that which is being mined, all embraced in one foot thickness of sandstone. From a geological point of view this circumstance would indicate that somebody or something has been driven to imprudent haste in the evolutionary development of coal. Darwinism and geology have now become inseparable. Viewed in that relation the most reasonable conclusion is, that at some previous time natural selection and survival of the fittest had agreed upon a division of labor. That in eliminating man the former had got ahead with his work—probably had him divested of his caudal appendage—perhaps already advanced to the gorilla stage of existence. The latter being admonished that such men as Darwin, Thompson, Spencer and Huxley would soon be on the stage, attempted by inconsiderate haste to compensate for his former laggardness.

While treating of this subject I would direct attention to another inconsistency in the teaching of geologists and Darwinian evolutionists. They aver that during the carboniferous era and for a long series of ages after that, although the world was filled with monstrous flesh-consuming reptiles there were not any herbivorous animals. Now in so far as we may reason by analogy, those were impossible conditions. If all the herbivorous and graminivorous animals were at this time exterminated, all those that are carnivorous would quickly perish from starvation, for I think no one will contend that any animal organism can subsist on a food exclusively mineral in character.

I will mention another fact of my own observation in disproof of one of the assumed principles of geology. Near to the town of Nanaimo, heretofore mentioned, there is a large granite drift boulder identical in character with thou-

sands of others scattered over the land in British Columbia, Washington and Oregon. It has been divided for the purpose of making a roadway along a hillside on which it lies. The division reveals streaks of small pebbles in it not differing in any respect from similar occurrences which frequently occur in common sandstone. This fact is of itself sufficient to prove that granite is an aqueous formation. Geologists may say that I am mistaken in my observation. The rock is still there to be seen by any one who may choose to take so much pains; but I apprehend that no geologist will ever see it. If one were dragged to the spot he would shut his eyes, or cover them with his hands like a woman or child wishing to hide from their sight some hideous object. JUSTIN CHENOWETH.

Mining Parlance.

EDITORS PRESS:—Your article headed "Mining Parlance," in issue of April 23d, not only contains a world of truth, but also allows a much wider application than is there given it, and furnishes food for serious thought as regards the light in which mineralogical and metallurgical questions are viewed by the average director and "business" manager.

It certainly seems, in many cases, a matter of perfect unconcern to them whether or not the machinery be imperfect, the methods faulty or the resultant wastage excessive, as long as they cannot literally see the metals running away in the slags and dumps, and just so long as dividends can be paid by hook or crook. All is serene, regardless of the principles of mining and metallurgy.

Your article speaks of a "prominent mining man" who asked, "What kind of iron ore is manganese?" and adds that "persons charitably disposed might say that 'this is only one instance out of a hundred.'" If so, then I can bring forward several other "cases out of a hundred," but will offer only one or two.

For instance, is the above remark, as coming from a "prominent mining man," merely, as pitiable as is the following, emanating from a man placed as metallurgist—save the mark—over several furnaces? Going to the chemist, one day, when the furnaces were not in the heat of order imaginable, he asked: "Mr. Blank, what is this blamed silica, anyhow? I hear a good deal about it, but don't think I ever came across any."!!! In the name of metallurgy, what business had such a man around a furnace? He it was who, beside performing numberless other unheard of feats, turned a 1½-inch stream of water into the stack to "keep her from blowing out." In spite of the confidence reposed in him, he was soon found a financial failure. A successor was appointed from among the vast army of book-keepers you mention, with no knowledge of either mineralogy, elementary chemistry or metallurgy.

He came into possession of a formula for charge calculation that seems to me a curiosity, belonging to the day when tobacco juice was used in amalgamation, and which serves for every kind and class of ores that come to him. Moreover, these ores embrace about all the most formidable enemies of the smelter. Substantially the rule runs as follows: "A pound of silica calls for a pound of iron, and lime must be added equal to two-fifths the iron used." The only determinations made by the chemist upon which to base this complicated calculation are those of silica, lead and silver in the ore, the silica and iron in the iron ores being guessed at, for the most part, and all other components being totally ignored. By using from 10 to 11 ounces blast and fuel enough, the conglomeration is melted and bullion produced, but the condition of slags and furnaces might easily be predicted.

Again, of a superintendent of extensive mines, the question was asked: "Are not your ores highly siliceous?" and he answered: "Yes, sir, and they are mighty sandy, too."

Now blunders like these would be vastly entertaining and amusing could one forget that they come from men in authority. Otherwise amusement turns to ridicule and ridicule to pity. Nor is this ignorance of mining parlance and principles the most deplorable feature in connection with such cases, for I have invariably noticed that these men are very narrow-minded, prejudiced and unreasonably contemptuous toward anything whatsoever pertaining to science and progress, as well as toward those more skilled than they. All this is sincerely to be regretted in a profession calling for the most intelligent direction and accurate information, and I have added these observations to yours simply as another protest against the blindness that insists on placing men unfitted for the profession in positions of authority, and also against that dogged persistence of the home office in thinking that "Tom, Dick and Harry, bookkeeper, dry goods clerk and Jack-of-all-trades" are singly and collectively perfectly capable of managing mine and furnace. In other words, that they can learn in a month that which constitutes a life's work and life study. You say truly that the man himself "not only sets himself at ridicule, but also the company which he represents." PROTESTER.

THE Supreme Court of the United States has announced a decision which renders all users of driven wells, not authorized under the Green patent, liable to damages for infringement.

Leaching Silver Ores.

[Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.]

This subject is attracting more attention than formerly; the introduction of the Russell process has at least provoked inquiry.

As some of your readers may not know what the Russell process is, I will say that it consists essentially in leaching the roasted ore, first by the Patera process, and then a second time with the addition to the leaching liquid of a certain proportion of bluestone. The solution thus "doctored" is called "extra solution," and is said to dissolve silver sulphide and some other compounds which ordinary hypo will not; also that it dissolves metallic silver more rapidly than simple hypo. (This latter statement requires verification, since it is known that copper precipitates silver from a hypo solution.) The use of the Russell process requires a separate storage vat for the extra solution. If the silver in the ore is chloridized to a high percentage, the extra solution is not worth its cost and trouble. In some cases, ores can be leached successfully by the Russell process without roasting; there are also cases in which neither roasting nor extra solution is requisite. As the Russell process is patented, its merits have naturally not been much investigated except by the parties interested, whose statements may possibly be a little too highly colored. Mr. Russell seems to prefer to apply his modification to the Patera rather than to the Kiss process, that is, to use the sodium hypo and the sodium polysulphide rather than the corresponding calcium salts, which are generally supposed to be the cheaper, and to possess other advantages, which, however, exist rather in fancy than in fact. For instance, it is alleged that the Kiss process gives a better precipitation of the silver than the Patera; also, that the former can extract a portion of gold if present, and that the latter can not. Against the first proposition we have the positive assurance of Mr. Russell, and against the second we have the authority of chemistry, and I, at least, of direct experiment.

As far as the Russell process is concerned, I see no reason why it may not be used in conjunction with the Kiss process. There would be a little calcium sulphate formed, but that would not be likely to do any harm. Moreover, this objection, if it be one, could be overcome by using copper chlorides instead of sulphate. Mr. Russell's preference must be chiefly based on other considerations.

A branch of the Russell process yields my lead that may be extracted in the leaching, separately from the silver. This is accomplished by the addition of sodium carbonate to the leach, which throws down the lead, leaving the silver dissolved.* The method, of course, necessitates the use of the Patera process; but the same object can be attained in the Kiss process by means of lime. However, the cases in which the saving of lead would be an object are comparatively rare, especially as it involves the use of a double set of precipitating vats. In those cases in which, as formerly at the Silver King works in Arizona, the precipitated silver is refined by cupellation, the separation of lead in the vats would be superfluous. I think, on the whole, we may set the question of separation of lead aside, and consider the merits of the Patera and Kiss processes on the basis of the relative prices and efficiency of the substances consumed in each, including the sulphur because the Patera admits of a considerable saving in that item, as compared with the Kiss. We need not consider the original cost of the two hypos for two reasons; firstly, because they are reproduced constantly by either process; secondly, because the calcium hypo is not in the market, and we always begin with sodium hypo which, in the Kiss process, is soon replaced by calcium hypo through the use of the calcium sulphide for precipitating. The whole question then hinges on the kind of precipitant used, sodium or calcium polysulphide.

The solvent powers of the two hypos for silver compounds are so nearly equal that there is, practically, no choice on this ground. It is claimed by Mr. Stetefeldt, on the strength of Mr. Russell's experiments, that the calcium hypo suffers more rapid deterioration than the other by exposure to the air; but the argument is of no practical value, because the fact, if it be a fact, produces no inconvenience in the works, where, with proper care, there is never any lack of leaching solution, granting a sufficient stock in the first place.

There are two reasons why less sulphur is or may be consumed in the Patera than in the Kiss process: The first is, that in the former the precipitant may be a disulphide (even a monosulphide might be used, but is objectionable because its oxidation by atmospheric influence forms a portion of caustic soda), while in the use of the calcium salt we are restricted mainly to the pentasulphide on account of the slight solubility of the other calcium sulphides. But a pentasulphide precipitates no more silver, molecule for molecule, than a disulphide, though containing 2½ times as much sulphur.

*This reaction was discovered by the writer, in conjunction with Mr. G. F. Beardsley, in 1882.

Add to this that there is more unavoidable waste of sulphur in preparing the calcium salt than with the sodium compound, because the best lime is even more impure than commercial soda, and the impurities are insoluble and retain a considerable proportion of sulphur. Another point in favor of the Patera process is, that the precipitant is made with very little expenditure of time, labor and fuel, while that for the Kiss process requires the cleaning and slaking of the lime, three or four hours' boiling, then settling, filtering and washing, and final removal of insoluble residues.

If all the materials are pure (and the sulphur may generally be assumed to be so), and if the precipitants are made in the usual way—that is, by boiling the caustic soda or lime with sulphur in water—one pound (avoirdupois) of silver requires for its precipitation, by the Patera process, 0.55 + pounds of caustic soda and 0.44 pounds of sulphur; by the Kiss process 0.39 pounds of lime and 0.9 pounds of sulphur nearly. These facts afford a basis of calculation as to the relative economy of the two processes after the percentage of purity of the soda and lime obtainable has been ascertained. Another point which may in some cases be worth considering is the possibility of recovering a portion of the excess of sulphur in the precipitated mass by boiling that with clean slaked lime (milk of lime), or with caustic soda. In the Kiss process this recovery may amount to a little more than half of the total sulphur used; in the Patera it will not be much more than one quarter of the total, if the precipitant consists mainly of the disulphide as recommended.

As to the actual cost for either process, great allowances must be made for the presence of base metal in the leach and for oxidation of the precipitant by atmospheric action, which is constantly converting it into hypo. The latter circumstance does not involve an unmitigated loss, for the hypo thus formed is one of the means by which the strength and volume of the leaching solution is kept up, notwithstanding a certain loss in working and the deterioration by exposure.

At the Silver King works in Arizona, I used, for 1 pound of silver extracted, 2.2 pounds of lime and 1.16 pounds of sulphur. In this case the lime was very impure, and a good deal of base metal had to be precipitated with the silver. I have no record at hand of my consumption at Melross, where I had excellent lime.

C. A. Stetefeldt, M. E., says in the *M. & E. Journal*, that at the Cosihuiriachic mill, in Mexico, Russell made comparative trials with the two precipitants with the following results: For each pound of silver got there were consumed, in the Patera process, 1.8 pounds soda and 1.2 pounds sulphur; in the Kiss process, 9.0 pounds lime and 3.84 pounds sulphur. I have no hesitation in saying that the figures given for the Kiss process are erroneous, or the process was not properly worked.

O. Hofmann, M. E., on ore from the same mine, by Kiss process, used, for each pound of silver extracted, 2.66 pounds of lime and 1.25 pounds of sulphur, which is reasonable.

CONFIDENCE IN THE COMSTOCK.—A dispatch from Virginia City says: There are more improvements now in progress on the Comstock than at any time since 1876. The current year promises to be the most prosperous in its history since 1878. There is a large force employed in preparing the foundation and framing timbers for the new stamp-mill at the Chollar shaft. The California battery mill is being overhauled and will soon wake the echoes of Six-mile canyon with the thunder of its 80 stamps. The water company has a force employed in laying a 12-inch iron pipe across Washoe valley and a wooden flume on the east side, which is completed to Bullion ravine. Several new private residences will be erected during the summer. Real estate has also advanced rapidly in value. This is illustrated by a transfer recorded last week, when \$250 was paid for a vacant lot on the divide where two years ago an area large enough for a cattle range could have been purchased for that sum. The increase of crushing facilities will result in materially augmenting the force of miners now employed in extracting ore, and lead to the development of many mining localities now virtually abandoned. The prospects of an era of increased prosperity are flattering enough to warrant the prediction that the total sum of monthly pay rolls will be swelled to \$300,000 before the close of this year, while the bullion product of the lode promises to exceed \$8,000,000 in 1888.

PLATINUM.—There is a large demand for platinum in New York at this time, and the mineral is worth as much in the market as gold—say \$16 to \$17 an ounce. One man at Coos Bay secured about 15 pounds, and this has been sent to Professor Day, the United States Geological Assayer. There is any quantity of platinum in Coos and Curry counties, but like the gold dust so often mentioned, is mixed with sand on river-banks and the ocean beach, and costs as much as it is worth to separate it. Platinum is also found in some places on the banks of the McKenzie, mixed with sand. Several nuggets of mineral have been found in the Granite Creek district in British Columbia, a few miles north of Colville, and specimens were sent to Prof. Day and pronounced first-class. Should the platinum be found in considerable quantities in this district, the finder, of a verity, will have struck a gold mine.—Portland Oregonian.

Southern California.

[NO. 2.—CONTINUED.]

(Editorial Correspondence.)

California is an empire of itself, both in extent and importance. It is over 700 miles in length, and has an average breadth of over 200 miles. It is four times as large as the great State of New York, twice as large as Italy, and nearly as large as France.

The Santa Ana Valley.

To the south of the city of Los Angeles, which formed the subject of our last letter, there is the large, level and fruitful Santa Ana valley, which takes its name from the Santa Ana river. Near the center of this valley is located one of the earliest colonies in Southern California—Anaheim. The story of the settlement and growth of this colony is well known to most of our readers. It is now, and for many years has been, an incorporated town, and has become quite a business center. The business portion of the town is well built up with substantial buildings. The streets are wide and very generally bordered with willow, pepper or sycamore trees, and present an appearance which is rarely excelled for picturesque and rural beauty. The waters of the Santa Ana river are largely utilized for irrigation, while in most portions of the valley artesian water can be obtained at very little expense. The climate of the entire valley is very equable, though generally moist from its close proximity to the ocean. The monthly average of the thermometer rarely ranges outside of from 50° to 72°. This, like all the other localities in Los Angeles county, is experiencing the general boom. The construction of the Atchison & Topeka railroad is giving an increased impetus to business generally. Real estate is rapidly advancing in value, and new settlers are constantly coming in. What has been done and is now being done in the San Gabriel and San Bernardino valleys will soon be repeated in the Santa Ana valley. There will be a succession of towns and villages all through the county. Already Tustin City, Orange and Santa Ana have so grown together that they practically comprise one community. They are now building a system of street railroads to more readily move from one section to the other of these lovely towns and villages.

Through the San Gabriel Valley.

The San Gabriel valley, however, is the great attraction to visitors, and, in connection with that of San Bernardino, forms the crowning beauty of the county and the State as well. This charming valley, all the way from Los Angeles to the foot of old Mt. San Bernardino, a distance of over 70 miles, is dotted with beautiful towns and villages, while one almost continuous line of orange groves and vineyards extend throughout the entire distance. The valley is traversed by two railroads and the route for a third is now being surveyed. The construction of the new railroad from Los Angeles to San Bernardino is opening up

A Great Number of New Towns

As the cars of the San Gabriel road leave Los Angeles, they pass through a section of country dotted with villas and orange groves, which is rapidly filling up with beautiful homes. The first important place reached is

Queenly Pasadena.

Which already has a world-wide reputation. Situated on the higher ground of the San Gabriel valley, 900 feet above the level of the sea, girted by towering hills and lofty mountains, she is warmed by a golden wealth of sunshine, and fanned by perpetual summer breezes. With a natural scenery not surpassed by Alpine lands, she is embowered in groves of orange and other tropical trees, and perfumed by flowers of every hue and shade, to which is added innumerable palace, homes and beautiful cottages, which are crowned with that gem of human art, the "Royal Raymond." No place is more justly famous on mesa, plateau or valley. It constitutes a beautiful park, and every traveler who visits it cannot fail to carry away most pleasant recollections, as of a visit to some fairy land.

Leaving Pasadena.

The next town reached, some four miles distant, is pretty little Lamanda Park. One mile further and the cars reach a spot where a new depot is to be erected, which will be the stopping-place for travelers going to the Sierra Madre villa and the new town of Huntington. The train stops next at Santa Anita, 17 miles east of Pasadena, from which point the traveler speeds on over a beautiful panorama of towns, villas, orchards and vineyards, through Baldwin's famous grants, to Monrovia and Duarte, until he reaches Azusa, 24 miles from Los Angeles. From hence a succession of towns, new and old, are reached in the following order: Gladstone, 26 miles from Los Angeles; San Demas, 28; Claremont, "the beautiful," 30; Pomona, 33; Ontario, "the foothill paradise," 38; Lordsburg, 40; Cocomungo, 42; San Bernardino, 60.

The Village of Pomona

Is located on the line of both the Southern Pacific and the Atchison & Topeka or California Southern railroads. The town is poetically and most appropriately named. It is romantically situated, in a charming spot, with beau-

tiful surroundings, while industry and intelligences are constantly adding new charms to the locality.

San Bernardino.

The San Gabriel valley at its eastern extremity gradually merges into what is known as the San Bernardino valley—a circular area of some 15 to 20 miles diameter. Near the center of this valley is located the city of San Bernardino, upon one of the most delightful localities a person can well imagine. The fertility of the soil, an abundant supply of the purest water—both river and artesian—a most genial climate, in connection with the delightful scenery which meets the eye in every direction, serves to render this a most desirable place for residence. In addition to the above natural advantages, art and enterprise have united in giving to the city

Commercial and Industrial Advantages

Of a most important character. Located in the midst of a most fertile valley, made up of a great variety of soil characteristics, it presents to the agriculturists who would locate therein and become tributary supporters to the city opportunities for producing the widest range of products. The mesa lands along the foothills, which almost entirely surround the valley, furnish the most desirable soil and climate for the culture of citrus fruits which can be found in the State—perhaps we might say in the world. The grape flourishes here to perfection, either for wine or raisins. All the mesa lands have to

Gridley and His Sack of Flour.

In the spring of 1864 fairs were held all over the land to recruit the funds of the Sanitary Commission, which had already raised over \$3,000,000 in following up the advance in readiness for battle; in hearing, from the heaps of dead and dying, the wounded to quarters of comfort; and on the retreat, ministering to agonized men who begged for water or to send a few words home.

Meanwhile, the need for money to keep up the work was pressing, and none felt the piteous appeal of soldiers helpless, hapless, on the field more than this sympathetic war-Democrat Ruel Colt Gridley, who bethought him to auction his sack of flour for the Commission—each one buying it to put it up again for sale. He had borne it, trimmed with streamers and flags, through the main street of Austin, from Upper Austin to Clifton, a mile and a quarter, to the air of "John Brown," to pay a wager that the "Democratic nominee for mayor would be elected."

After expressions of mutual good-will across the query, what to do with this flour? The proposition to make Republican griddle-cakes, allowing Democrats none, drew protests of fealty to the Union from Democrats. Mr. Gridley tested this crowd's vaunted loyalty by the plan of auctioning the flour for the soldiers.

Wild cheers greeted this proposal. T. B.

THE GRIDLEY MONUMENT.

be irrigated, for which an abundance of water can be obtained from the numerous streams which flow from the adjacent mountains. These streams can also be supplemented and their volume of water kept up during the dry months of summer by

A System of Mountain Storage

For which large and convenient mountain valleys are found, which may readily be converted into huge reservoirs of winter water, which, without such storage, would pass off into the ocean during the winter and early spring months, without benefit to industry or commerce. One such system has already been perfected by the Bear Valley Water Co. Others are possible and will be provided as soon as a sufficient number of settlers come in to locate and create a demand for such surplus water. In this manner every acre of mesa land of this and the neighboring valleys will soon be utilized and covered with trees, vines and happy homes.

ALASKA MINES.—The steamer Olympia, from Alaskan ports, brings news that 20 miners left last week for the Upper Yukon country from Juneau, and every man entering that country is compelled to pay a royalty to a tribe of Indians who command the road, for the privilege of passing through the country. About 200 men have departed this season from Juneau for there, and only meager reports have been received, which indicate that they are striking rich finds. Some rich quartz ledges have been discovered in the town of Juneau, where some fine mineral specimens have been obtained. Large shipments of gold bars from the Pais mine were made on the steamer Pinta, valued at \$20,000 for each of the eight bars. Reports from the Silver Bow district continue to indicate that a large amount of mineral is being obtained from the mines.

Wade, auctioneer, cried off the first bid to Mr. Gridley for \$300, a Republican \$350; Mr. Buel, beaten candidate for mayor, bid a certificate of the Indian Department, \$1115, but all bids were payable in gold coin, and the munificent offer was rejected. Five thousand dollars was paid over and two blocks of lots in Watertown—one given by Mr. Buel.

With Mr. Gridley on a fine horse, the procession formed again and escorted the hero in triumph home. He paid the express charges and sent the money to the commission.

Gold Hill wanted a chance, so on May 16th a procession, with Mr. Gridley, formed through the main street to Maynard block, where "silver-tongued" Tom Fitch spoke, and the flour realized \$5225. The procession was christened "The Army of the Lord," as it marched through the canyon with flags and music to Silver City, where in all \$1375 was raised; thence to Dayton, where \$1847.50 footed up for the fund on Carson river.

Through all the Washoe mines it was sold, till \$22,000 more was placed to the credit of the Midas sack of "Austin Sanitary Flour." Virginia City outdid all others, contributing \$12,995 in coin and considerable mining stock. To Sacramento and San Francisco he took the magic sack, selling and reselling it, till when he started East \$63,000 stood to its account, with three blocks of lots in Austin, worth \$7000, and a house and lot in Dayton.

Through all his journeying, he bore his own expenses and the expressage of money, and raised in coin \$275,000, in all nearly \$300,000.

The monument soon to be finished and dedicated in Rural cemetery, Stockton, in honor of the hero of the famed "sanitary sack," is thus described in the *Independent* of 19th inst., according to the plans and specifications:

The monument is to be made of California granite and Italian marble, and will be 20 feet high. The bottom base is to be of Penryn

granite, 6 ft. square by 2 ft. 4 in. high, neatly finished with a patent hammer, 8 cuts to the inch. The second base is to be of Crystal Lake or Rocklin granite, 4 ft. 11 in. square, by 1 ft. 8 in. high, neatly finished with a patent hammer, 10 cuts to the inch. The third base, of Italian marble, 4 ft. 1 in. square, by 1 ft. 6 in. high. The same to be polished with the name of "Gridley" inscribed thereon in letters raised 1 inch. The die to be made of Italian light vein marble, 3 ft. 3 in. square by 5 ft. high. The columns and die to be cut in 1 piece and polished. The inscription is to be in finely cut raised letters. The plinth of Crystal Lake or Rocklin granite, 3 ft. square by 10 in. thick, polished. The cap of Rocklin granite, 3 ft. 11 in. square, by 1 ft. 10 in. high. The face of the cap polished on four sides.

The figure to be made of the best light vein Italian marble, 2 ft. 6 in. by 2 ft. 7 in. by 6 ft. 10 in. high. The same to be cut from a photograph of Mr. Gridley so as to closely resemble him.

The concrete foundation is to be 6 ft. 8 in. square, and not less than 6 ft. 6 in. deep. The monument will be reared in the Grand Army park, which has been graded for the purpose. The contractors, Knealeys, Spellman & Co., have completed the foundation in a manner entirely satisfactory to the committee, and are only waiting for the arrival of the statue from Italy to finish their work.

The Secretary of the Treasury has just written the committee that there are ample provisions in the statutes to authorize the free entry of the statue. An effort is also being made to secure from Alcatraz 14 pieces of ordnance, to be used in further ornamentation of the plat in which the monument is to be erected; and as Gen. Howard and ex-Congressman Lottitt have interested themselves in the matter, there is some hope of obtaining the coveted cannon.

RELICS OF '49.—Scattered here and there among the pines and thickets, along the streams that were mined away back in the fifties, are many lonely graves. The lapse of years has destroyed the stakes which once stood at head and foot, covered them with leaves, and in some cases trees are growing upon the little mounds, and in a few more years there will be nothing left to mark the resting-place of many a pioneer who died and was hurried without the rites of burial. Many of these graves are lost to even those who once knew where they were, and in a few years there will remain to us nothing of them but memories. Along the banks of Deer creek, the Yuba and all the other streams that were once remarkable for their richness, can be seen the sites of the cabins of the '49ers. Time has destroyed the walls and roofs of those cabins, but the level ground floors and the old stone chimneys, plastered with mud, still remain. These old chimneys are the only monuments left to mark the places where the pioneers lived through the stirring "days of gold." And even the chimneys are fast crumbling with decay. Vines, weeds, bushes, and the mold which gathers about all old ruins, have been slowly hiding them from sight.—*Nevada City Herald*.

THE KEENNESS OF DISCERNMENT IN THE PHOTOGRAPHER'S LENS.—The photographer's lens is more discerning than the naked eye. A recent photograph of a figure painting by an American artist shows that a woman's gown was first painted a hue and texture very different from that finally chosen, the underlying brushwork appearing plainly in the photograph, though not seen by the most attentive observer of the original picture. In like manner, photography reveals stars that to the human eye are not distinguishable from nebulous matter. Photography has also been recently introduced as an assistant in diagnosing disease, as was shown in a paragraph in our Health Department of a few weeks since.

AN OLD ENGINE.—A little engine with a history going back to the '60's may be seen at the West Oakland yard. It was built to operate the old Alameda & San Francisco railroad, which ran from Alameda Point to Melrose, and was one of the first railroads in the State. This locomotive was built in 1865 at the shops of the road in Alameda, and has a 14 inch stroke. Not much of the original material remains because it has been rebuilt and repaired many times, but it still retains its name, "J. G. Kellogg." Recently it was in use on the Stockton & Copperopolis road, but was brought down to pull the Berkeley local.

THE marine engineers are discussing the standard of wages for engineers and firemen on the new steam schooners now being built for the coasting trade. The engineers say that the owners of the new schooners intended to run their vessels on a reduced crew and for about half the wages usually paid. Resolutions were adopted fixing the wages of chief engineers at \$120 a month and of the first assistant at \$90, and requiring two firemen to be on each boat. This schedule will be submitted to the schooner proprietors.

TRAVELERS still claim that a volcano is in active eruption in the Sierra Madre mountains in Mexico.

A RAILROAD from Hailey, Idaho, to the Gold Belt mines will shortly be built.

THE Southern Pacific Co. is erecting new boiler shops at Sacramento.

TABLE OF CONTENTS.

EDITORIALS.—Recording Earthquakes; Water Wheels, 361. Passing Events; Figuring on the Bullion Product; Gold on Alaska Islands; The Alien Act; Cements, 364. Shasta County Mines, 365.

ILLUSTRATIONS.—Self-Registering Instrument for Recording Earthquakes, 361. The Grindley Monument, 363. Map of the South Fork Mining District, Shasta Co., Cal., 365.

CORRESPONDENCE.—Coal Mines and Geology; Mining Parlane; Leaching Silver Ores, 362. Southern California, 363.

MECHANICAL PROGRESS.—Mechanical Foolhardiness; Iron Sleepers in France; The Fly-Wheel; Mechanical Tests; Carbolic Acid; To Remove Varnish From Paint, 366.

SCIENTIFIC PROGRESS.—The Locomotive as a Weather Indicator; Still Another "New" Explosive—This Time for Coal; The Storage of Electricity; Some Alleged New Elements; A Singular Accident; Peculiarities of the Mercury Thermometer; Enormous Snowflakes; A Lonely Flower; How Electricity is Engendered in a Thunder Storm; A Valuable Recipe; Mountain and City Elevations; Every Insect Has Its Use; Application of Electricity to a Weaving Purpose, 366.

ENGINEERING NOTES.—The Hudson River Tunnel; The Engine of the Future; Railroads in India; Great Activity in Bridge Work, 367.

USEFUL INFORMATION.—How to Use Glue; The Philosophy of Shoe Blacking; Protecting Animals from Flies; Birds as Weather Annunciators; To Clean Feathers; Balloons for China; Washing Lamp Chimneys; A Milk-Fed Pumpkin, 367.

GOOD HEALTH.—The Cancer Discussion; Regular Exercise; The Weak Points in American Constitutions; Experiments with Tapeworm Eggs; The Duration of a Generation; Professional Fatigue; How to Cook Fish, 367.

MISCELLANEOUS.—Griddle and His Sack of Flour, 363.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 368-9.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assements, Dividends, and Bullion Shipments, 372.

Passing Events.

There is quite an excitement just at present in Alaskan quartz mines. The new mine on Ounga island, of which we spoke last week, had its working capital subscribed for immediately, and the stock went up very high. Stock in an extension of the mine was also quickly taken up. Another claim was also stocked and the working capital subscribed in two hours. The ledges up there are very large.

The new Monterey county mines still attract considerable attention from residents of that and San Luis Obispo counties. Thus far, however, no very wonderful developments have been made.

The workings of the Alien Land law, to which we have before referred, are being discussed with much spirit by the press of the Territories. There is a universal feeling that, while the measure may do very well to prevent foreigners acquiring large tracts of grazing or agricultural lands, it is a mistake to apply it to mining fields.

Work is now in full blast in all the mining camps in the more elevated regions of the coast, where the long winters retard work more or less.

The lumber sawed in the small mills of the Sierras is mostly taken up in the local trade near the mills and never reaches the larger markets.

Figuring on the Bullion Product.

We gave in last week's PRESS a summary of the Mint Director's report for 1886, including estimated product of bullion in the States and Territories of the Union for that year. As it comes to us, this report is made to say the product of gold last year, as compared with that of 1885, shows an increment of \$32,000,000—obviously an error of transmission or of the types. Two million dollars might have been the figures given, though the actual increase was over three millions.

To Colorado the Mint Director accords the honor of having been the largest gold and silver producer of the several countries mentioned in his report, Montana being ranked as second in this respect. We do not know on just what basis Director Kimball figures in arriving at this conclusion; but, consulting certain data, we are led to doubt its entire correctness, claiming for California the distinction he has seen fit to award to these countries. The bullion product of Colorado and Montana for 1886 amounted to \$25,000,000 and \$20,840,000 respectively, values of copper and lead included. Deducting value of these two last-named metals, say nine millions for Colorado and seven for Montana, would make the gold and silver product of the former \$16,000,000, and of the latter \$13,840,000, against \$17,000,000, the California output of these metals for the year mentioned. Even if we have somewhat overrated the value of the copper and lead turned out in Montana, she is no doubt distanced in the race with California for supremacy as a producer of the precious metals. That California leads every other country in the world as a gold-producer remains, of course, unquestioned.

The extent to which the large reduction works in some of these interior countries, notably those of Utah and Colorado, receive from outside localities ores and base bullion for treatment becomes more or less a source of error in computing the annual bullion product of those countries. The rich silver-lead ores of Idaho, shipped to the extensive smelters near Salt Lake City, and to the great reduction establishments at Denver for sale or treatment, are liable to receive a double credit, unless more care is taken to avoid such result than we have reason to believe is always observed. In like manner, bullion deposited at the U. S. assay office at Helena, but coming from sources outside Montana, is exposed to be credited to the latter.

The list of our bullion-producing countries has come to be officially increased by the addition of another State, Texas finding, for the first time, a place as such in this last report of the Mint Director. Her quota for the year—all silver—is set down at \$200,000.

Gold on Alaska Islands.

Samples of ore from a new mining discovery in Alaska are on exhibition at the office of Geo. W. Sessions, in Nevada block. The new mines are on Ounga island, one of the Chomagin group, 100 miles west of Sitka, 200 miles east of Ounaska, and 1200 miles north of San Francisco. The island is near the southwestern shore of the Alaskan peninsula. It is about 14 miles long and 6 wide. Geo. C. King, who went there for the Sitka Mining and Commercial Company last summer to look for coal and copper, found the ledge in September. In December another expedition of the same company went up and made more careful investigation. The result was that early in April another expedition, with a number of miners, a five-stamp mill and supplies, landed on the island.

Active work was begun on the ledge. It has been traced for some 10,000 feet. It was found that the porphyry hanging-wall on the east was 200 feet from the outcrop, the granite foot-wall on the west was 800 feet from the outcrop, and the outcrop was at no point less than 100 feet in width.

To determine the value of the rock in the ledge, two crosscuts were started—one from the east side and one from the west—at a vertical depth of 50 feet. The crosscut from the west, at a distance of 20 feet, struck a body of galena ore which was from two to four feet thick in the bottom of the cut the day before Mr. Sessions left for home. The assays were from \$5 to \$200 in gold and silver, and the ore

also carried from 70 to 80 per cent galena, which alone, at present quotations, is worth \$80 per ton.

It will be remembered that the big mine of Alaska, known as the Treadwell, is on an island—Douglas—and there are plenty more islands to prospect. This new discovery will doubtless cause a more vigorous prospecting on the islands, as well as mainland of Alaska. A mining district has been formed on Ounga island, where the big ledge has been discovered.

The Alien Act.

As an extra session of Congress seems to be in order, it would in that event be well for our Pacific Coast delegation to do all in their power to so amend this questionable Act that was "railroaded" through at the close of the last session that the mineral lands and mines of our Territories shall be excluded from the effects of this impolitic measure.

"America for Americans" is all very well, and American capital for American mines is something desirable; but, unfortunately for us, our capitalists are, with but few exceptions, not mine investors, particularly in mines of the precious metals. They prefer other classes of securities. Unless the Act is amended so as to admit and encourage foreign capitalists on liberal terms to invest in our mines, the result will be that a large percentage of the mines of our Territories will remain undeveloped and dormant until we, as a nation, shall have become mine-workers and capital shall have become more abundant.

We stated in a previous issue of the PRESS that a very large amount of capital had been already withdrawn by English investors from this country. The following comprise a few of the withdrawn mining propositions which have come under our notice, where the capital had been more or less subscribed, but where the companies were "called off":

In Idaho, the Silver Mountain, Col. Mat Graham & Co., \$85,000. The Victoria Consolidated, placed by Alexander McWhealley, in London, \$1,250,000. The deeds were ready for transfer and money ready for payment when the passage of the Act and its prohibitory clause became known and understood.

In Montana, a large gold mine, 15 miles from "The Montana," sold for \$500,000.

In New Mexico, an extensive property, bought by Messrs. Richard & Chadhaven for \$2,500,000.

We are informed that one of the heaviest mine houses of London was recently negotiating for an extensive mining property in New Mexico, and negotiations had advanced to that extent that their expert, Mr. James Banallack, of Grass Valley, was ordered to examine the property and report. The "Alien Act" became a law and this trade was called off. Mr. Banallack was cabled to proceed to Mexico to examine a mine in place of the one that they contemplated purchasing. He left this city Monday, May 30th, for that purpose.

No business so rapidly develops a country as that of mining. Towns and cities spring into existence like magic, giving employment to the laborer, artisan and farmer. The rugged mountain chains and barren wastes seem destined by nature as the metallic domain most favorable for mineral deposits. The country is soon opened up by wagon roads, followed by railroads.

It is a singular fact while we are throwing obstacles in the way of the introduction of foreign capital, our near neighbors are encouraging the development and settlement of unoccupied land, both agricultural and mineral, by building railroads, and by liberal measures the Canadian Pacific railroad on the north bids fair to be a serious rival to our system of railroads that span the continent. On the south our sister Republic (Mexico) has thrown wide open her doors and offers every inducement to both agriculturist and miners to colonize her vast territory and develop her mineral resources. Her colonization laws are liberal. The code of laws governing her mines are superior to ours in many respects. It is necessary for us also to do something to get people to invest in our mines. The law referred to does not affect the States except indirectly, but the Territories have much to complain of from its enactment.

The inquest into the causes which led to the Nanaimo disaster is progressing.

Cements.

The United States produces in cement made from natural rock about 4,000,000 barrels, of 300 pounds each, every year, and there is also made about 150,000 barrels, of 400 pounds each, of artificial cement (American Portland). Notwithstanding all this, we import about 650,000 barrels, of 400 pounds each. The greatest amount is received at New York, but at this port we receive from 150,000 to 160,000 barrels a year. Both the production and the importation are increasing year by year, as it is coming more largely into use.

Manufacturers in this country are seeking to improve their products in order to compete with foreign supplies. All hydraulic cements require an especially dry atmosphere, yet even that will not always retard deterioration. It has been shown by long and constant experience that both domestic and foreign cements, when allowed to remain in store for a long period, no matter how dry the location, are sure to absorb some moisture and undergo chemical changes that must gradually impair their setting and hardening qualities. On the other hand, there is danger that unburned cement, especially the artificial product, may contain an excess of free caustic lime that can only be removed by careful air-slaking, and would seriously threaten the solidity of work upon which it might be used if it passed directly from the factory into consumption.

All producers and consumers are now convinced of the necessity for a standard test and grading, and are arranging for that end. Portland cements are receiving some very critical scientific attention, and these properties are becoming better understood than any other similar product. People who buy are testing briquettes of cement more than was formerly the case. An English scientist, after a detailed statement of methods and tests employed, reaches the following deduction as indicating the prerequisites of a first class cement:

1. *Fineness.*—To be such that the cement will all pass through a sieve having 625 holes (25x25) to the square inch, and leave only 10 per cent residue when sifted through a sieve having 2500 holes (50x50) to the square inch.

2. *Soundness.*—That a "pat" made and submitted to moist heat and warm water shall show no signs of blowing in 24 hours.

3. *Tensile Strength.*—Briquettes which have been gauged, treated, and tested in the prescribed manner shall carry an average tensile strain without fracture of at least 175 pounds per square inch at the expiration of three days from gauging, and those tested at the expiration of seven days from gauging shall show an increase of at least 50 per cent over the strength of those at three days; but the briquettes broken at the seven days' test shall carry an average tensile strain without fracture of at least 350 pounds per square inch.

Such a specification meets all requirements and satisfies the peculiarities of nearly all cements except, perhaps, the very quick-setting ones, for which a slight variation in the tensile strength and the percentage of increase between the dates mentioned would have to be named.

THE members of the Marshall Monument Commission have visited Coloma. The monument is to be erected over Marshall's grave, on the summit of Marshall hill, overlooking the beautiful town of Coloma. The monument is to be massive and of great height. The material to be used is granite from the quarries in the immediate vicinity. Proposals will be advertised for as soon as the specifications are made and the title to the ground and roadways secured.

A SPECIMEN of coal several feet thick has been taken from the coal mine near San Miguel. The vein proves to be 14 feet thick and has been tunneled for 60 feet, showing 30 feet of solid coal. The Pacific Improvement Company is developing the mine for its own use as rapidly as possible, and will store the coal at San Miguel.

QUICKSILVER.—The shipments of quicksilver from Calistoga to San Francisco in the month of May were larger than usual and amounted to about 38,000 pounds. Prospects at the quicksilver mines have improved a little lately.

DURING a recent fight in the Yukon country a miner was killed and five were wounded by Indians, who lost five killed, besides having several badly wounded.

Shasta County Mines.

The South Fork Mining District.

The South Fork mining district is situated in Shasta county, California, and on the south fork of Clear creek, which heads in the Shasta range of mountains, and whose waters find their way through Clear creek into the Sacramento river. These mines lie about 20 miles west from Anderson, a thriving town on the C. & O. R. R., 222 miles north from San Francisco, and may be reached in a day's travel from the city. The South Fork district lies on the eastern slope of the Shasta range, and extends from the divide on the west to the Sacramento plains on the east. Its area is about 60 square miles; mean altitude 2000 feet. The surface is rugged, being cut by many gulches and deep canyons which carry more or less water. The principal streams of the district are Andrews and Eagle creeks and South Fork, the latter carrying from 40 to 60 miners' inches throughout the dry season. Covering at least two-thirds of this district on the east the formation is slate, although on the extreme eastern border some lime is found. To the west, and as you ascend the mountain, the formation is granite and porphyry, granites predominating.

The accompanying map shows the features of South Fork district, with the mines. The numbers refer to locations, as follows:

1. Peerless.
2. Monte Cristo.
3. Alma.
4. Crown Point.
5. Lucky Bill.
6. Continental Consolidated.
7. Odessa.
8. Hope.
9. Chico.
10. Chico North.
11. Dayton.
12. Smith.
13. Florence.
14. Great Falls.
15. Manzanita.
16. Manzanita North.
17. Blue Bell.
18. Lone Star.
19. Wright's, J. P.
20. Pacific.
21. Cold Spring.
22. Tornado.
23. Golden Eagle.
24. Little Giant.
25. Wright's, J. P.
26. Grand Central.
27. Brown & Zoellner.
28. Big Central.
29. South Chicago.
30. Chicago.
31. North Chicago—Pat'd.
32. Live Oak.
33. Knab's.
34. Red Warrior.
35. Woodfill's.
36. Cincinnati.
37. South Crystal.
38. Crystal.
39. North Crystal.
40. Arizona.
41. Confidence.
42. Black Prince—South.
43. Black Prince.
44. Flicker.
45. Hardscrabble Hydraulic Mine—present works.
46. J. P. Jones' Ledge.
47. Buena Vista.

The principal ledges of the district are found in the granite, varying in width from a few inches to 100 feet, the vein matter consisting of ore, quartz, spar, clay and talc. Generally their walls are well defined and mostly lined with a clay gouge. Their general bearing is to the E. N. to N. E. Their dip is to the east at angles of from 10° to 25° from the perpendicular. Many of the more prominent ledges can be traced several thousand feet, but generally the outcrop is not bold, owing to the extensive disintegration of the country rock.

The ores of the district are: A, free gold in quartz gangue; B, free gold ochreous (decomposed sulphurets); C, gold-bearing sulphurets; and D, ores carrying variable proportions of gold and silver, more or less refractory, the bases being pyrites (iron and copper), blende galena and fahlore, some of these latter ores carrying a notable percentage of native sulphide, horn and ruby silver.

Of Class A the Flicker, without doubt, stands in the lead as producing the richest ores at present being worked in this district, ores from this mine having milled as high as \$1 per pound.

The principal mines of Class B now being

worked are the Hope, Falls, Manzanita, Big Central, the Pacific group and Wright's group and a few others of lesser note. The ores of this class are worked by arrastra process and yield from \$20 to \$100 per ton.

There is being no effort made to produce ore of Class C, except in assessment work, there being no mills for their reduction at present, short of San Francisco. The sulphurets from these ores are high grade, ranging from \$400 to \$2000 per ton. The possible output of ore of this class from mines within one mile of the Pacific can be safely estimated at 50 tons per day for 10 years, and will only ores that paid better than \$25 per ton.

Of the mines coming under the head of Class D, that are being exploited, are the Crystal, Chicago, Chico, Red Warrior, Dayton and Continental Consolidated, and Arizona.

The Chicago lode has been worked more or less for the past 12 years, and with varied success. Many tons of its ores have been shipped

At the breast of this drift a stope has been made 15 feet in height to form three benches of five feet each. All of this work is in ore, the ore body averaging from four to six feet.

The surface indicates this ore body or chute to be over 200 feet in length and the ledge 20 to 60 feet in width. To the face of the lower drift the ore body averages five feet, and a crosscut here of 16 feet shows another ore body of two feet equal in high-grade quality to the main ore body.

The amount of high-grade ore now on the dump aggregates 250 tons, of an average assay value of from 50 to 80 ounces per ton. South from this work 350 feet, and 100 feet lower, a working tunnel is being drifted in on the ledge, and is now in 30 feet. The ledge here shows 12 feet between walls, the ore body showing a width of 40 inches, of an average assay value of 20 ounces.

The Continental Consolidated property consists of two claims of 1500 feet each in length.

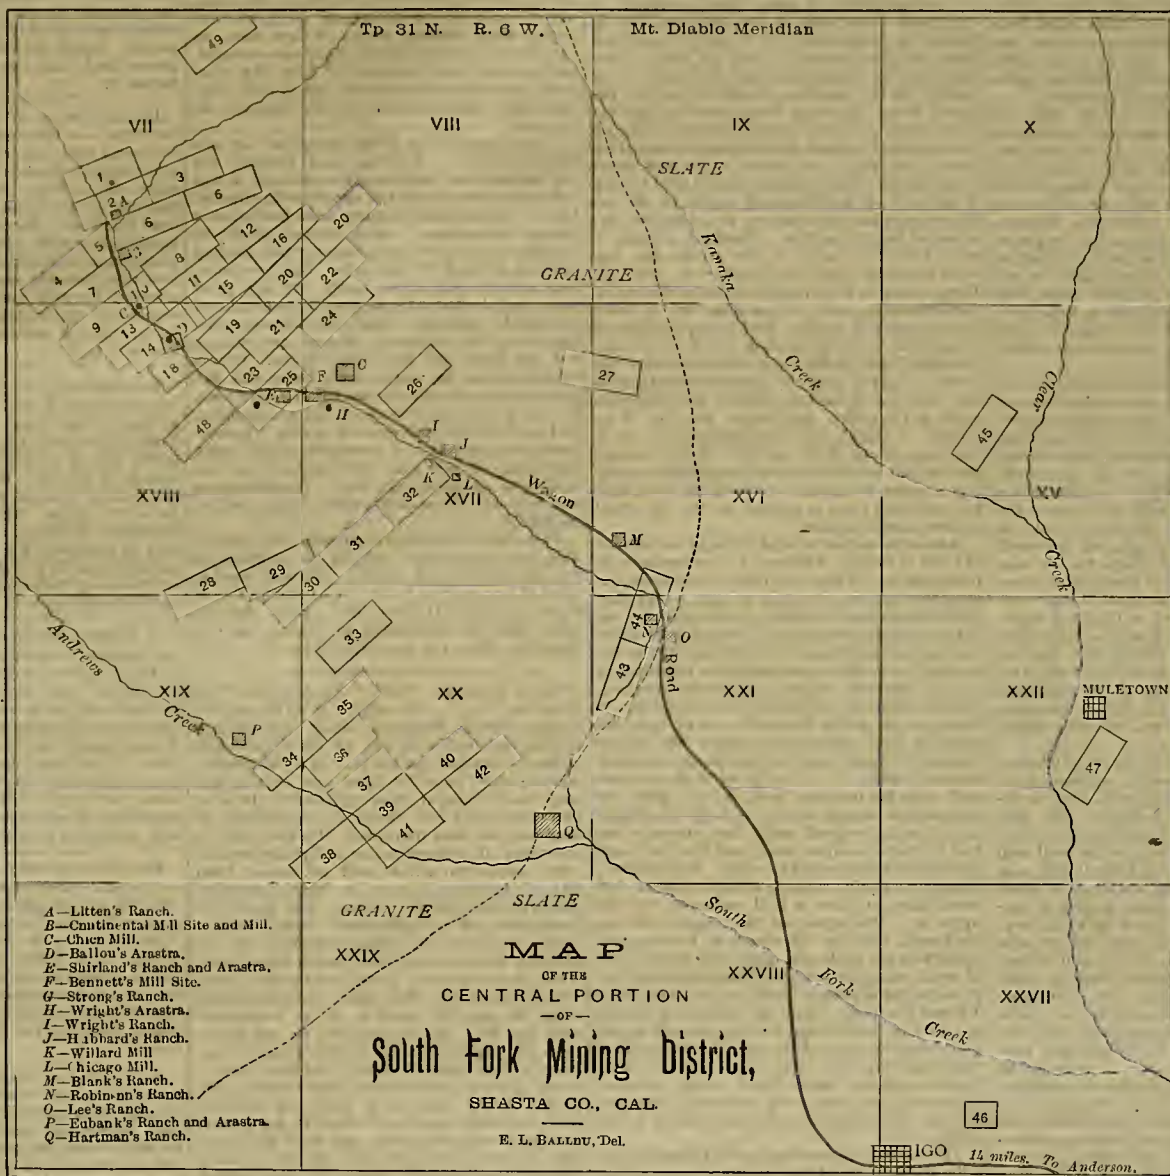

to put up reduction works in the camp at once. The ores are in unlimited supply, and of unusually average high grade, and there is every facility in the way of wood, water and accessibility for their cheap reduction. Col. Gihney has made a rich and extensive strike in the Arizona, and is taking out splendid ore. John Wright is sinking on the pay chute in his mine with splendid prospects in free gold. His ledge is from 14 to 20 inches, and is increasing in width and richness as work progresses. He has explored the pay chute for 70 feet along the ledge and worked the ores in his arrastra, and the yield has been over \$50 per ton. The Shirland Bros. and Hubbard keep their arrastra running constantly, and are making new and rich developments in their mines every day. E. L. Ballou has just completed a new lower tunnel in his Manzanita mine, and cut the ledge 150 feet below the surface, which has developed a large body of rich ore. His arrastra runs night and day. At the Continental, work is progressing

as usual. Some new timbering is being done and preparations being made to continue the lower or 200-foot level. There is a large amount of high-grade ore on the dumps at this mine, and immense amounts uncovered in sight. A rich body of chloride was struck in a new opening near the summit of the ridge last week which has created quite a stir in the camp. The outlook for the camp is very encouraging. Prospectors are getting quite numerous, and new finds are the order of the day.

Mining operators are beginning to visit the mines, and are astonished to find such large ore bodies. Several large sales are reported as on the eve of consummation. What is wanted to make South Fork boom is reduction works, where the miner can take his ores and get them worked, or sell them outright. There is an opening here that will repay a thousand fold on the amount of capital that would be required to put up the necessary plant.

MINING PATENTS.—Notice has been received at the United States Land Office that patents have been issued to the following mining claims: Georgetown mining district, Yankaley placer claim; Iowa Hill district, the Insolvent and Dolly Varden placer claims; Ophir district, the Morning Star quartz lode claim, the North Star lode claim and the Middle Star claim; Bird's Flat district, Atlan's placer claim; Oak Bar district, Blue Lead placer claim; Foreman's district, Thorpe lode claim; Sierra County district, Black Jack quartz lode; North Bloomfield district, De Noon placer claim; Meadow Lake district, Johanna quartz lode; Cinnabar district, Carr quicksilver lode; French Gulch district, Cornet Gold quartz lode and the Shea placer claim; Low Divide district, Mountain View Chrome Iron No. 2; Calistoga district, Ida Easley lode claim; Patterson district, Great Western lode claim.

THE RIVER MILLS.—An Empire City correspondent of the Carson Tribune says: "The Santiago mill is not shut down for repairs, as reported in some of the papers." He says: "There is not a stamp hung up from the Mexican mill to the Eureka. The total number being Mexican, 44; Morgan, 40; Brunswick, 56; Vivian, 16; Santiago, 38; and Eureka 60, or 254 in all."

to San Francisco and Denver and worked at a profit, while much more has been worked on the ground by the roast-chlorinating process. This mine is practically worked out above the 280-foot level. Below this level prospecting is going on.

The Chico lode cannot be considered fairly prospected as yet, but sufficient work has been done to show a strongly defined ledge and a large body of high-grade ore. The same may be said of the Crystal, Warrior, Diamond, and Dayton. Ores from all the prominent ledges of the district have been worked in San Francisco, Denver, and even Swansea.

The Continental lode has been prospected for 3000 feet with open cuts, tunnels, drifts and shafts, proving it to be one of the largest ore fissures in the district, with well-defined walls lined with gouge and filled with immense bodies of high-grade ore. The principal developments are: A drift tunnel of 25 feet, tapping the ore chute at 50 feet; 50 feet below this another tunnel is driven in on the ore body 110 feet; at the mouth of this tunnel a shaft is sunk 50 feet, and from this level a drift pierces the ore body 50 feet.

In addition to the above information, which we take from a report on the district, a correspondent sends us the following concerning the mining situation at present:

Mining matters are looking up in this district. New mines are being opened up and the work of development is being diligently prosecuted in many of the old ones, and large quantities of high-grade ore is being uncovered. At the Black Diamond, Robinson & Co. are taking out some very fine ore, which they are sacking for shipment. Oampell & Co. are hauling two carloads of ore to Anderson for shipment to the Reno works. One carload is from the Chicago mine, and assays way above \$150 per ton. The other carload is from the Crystal mine, and is also very fine ore. These parties propose to continue shipments as fast as they can extract the ore. The favorable rate of \$4.70 railroad freight, and the freight from the mines to the railroad being \$4 per ton, makes it possible to ship large quantities of ore profitably. The Continental owners are also preparing to ship ores, besides several other parties. It is to be regretted that the miners cannot get capitalists

MECHANICAL PROGRESS.

Mechanical Foolhardiness.

Carelessness kills more mechanics than old age or disease, and the number of accidents resulting from somebody's carelessness cannot be estimated. There is not as much danger in doing risky jobs and undertakings as there is in the every-day risks which are met with a contempt brought about by a long acquaintance therewith, and which are hardly regarded as risks by the men who take them. The architect takes risks which are needless when he guesses at the strain to be overcome by beam or truss, and also, and doubly so, when he also guesses at the strength of that beam or truss. The builder in turn takes a risk when he passes defective construction with the guess and the hope that "it will hold." In driving a piling for a block of houses in Harlem, the writer noticed that some of the piles were driven 12 to 20 inches by the last blow of the hammer, and he wondered at this risk taken by the builder for the sake of saving a few dollars thereby. In building a railroad bridge in New Hampshire, the contractors put down piling where the last blow drove some piles four feet! In this case some piles were driven too far, whereupon the risky, rascally contractors laid hold of said piles and pulled them up again until they were in the required position.

In erecting buildings, hundreds of risks are taken by the workmen themselves, by the owners, and by the builders also. In erecting machinery, too, risks continue to be taken, and after the machinery is running it seems almost as if the attendants vied with each other in courting danger. Begin with the fireman. How many times will he risk his life by guessing that the safety-valve is in perfect order, or that the combination water-gauges pipes is not plugged up! All too often he will guess that his boiler is safe, and run with dirt, leaks, corrosion, and he knows not what else, in that straining and groaning iron shell under which he shovels coal.

Why is all this? we may well ask. Is the man a lunatic? Is the man a fool, or what is the matter with him? There are just two other causes which may affect his behavior, for he may be lazy or avaricious; then in this latter case he is a villain as well. The architect was lazy; he didn't figure because it was easier to guess. The builder who drove the piling was a knave. He did this in order to make more money out of the job; but the workmen who get maimed or killed, the fireman who lets his safety-valve get stuck, he is sometimes a fool, but more often these things happen through pure laziness, and laziness alone. The engineer who almost hourly exposes himself by walking under the expend belt from his engine, this man is lazy; but he is abetted in his laziness by knavery, in shape of an avaricious owner, who grudges the few dollars necessary to box up the dangerous place, and thus relieve the lazy man's temptation.

Lazy men run all sorts of risks in putting on belts, in fooling around moving machinery and in monkeying with running tools, such as circular saws, planers, and molders. The man who crawls around exposed machinery to oil or clean the same, when he can just as well stop the machine before exposing himself, this man deserves to be sent up for ten days for every offence. Only a few days since, a party of masons were building a 100-foot mill chimney. They had got up 18 feet, when all at once the whole party were on the ground among bricks, mortar, and splintered lumber, with two of their number seriously hurt. An examination showed that in nailing on the last course of ledgers, only one nail had been put into some of the posts where six should have been driven. Here was a clear case of laziness and foolishness combined, with the poor consolation—to the victims at least—of knowing that only themselves were to blame. Sometimes this carelessness becomes criminal, and is occasionally brought to justice; and lately, where knavery is the cause of accident, it has been frequently severely punished. There is no excuse for exposure to such accidents, and every man can educate himself out of it if he will.

Familiarity is one great cause of a man getting careless and lazy. He works around machinery so long without accident that he thinks, if he thinks at all about it, that he knows all the ins and outs, all the dangerous places and death-traps, so he will not have to be so continually on his guard. It is a good deal of work to keep his thoughts on his fingers all the time, so our man gets a little lazy, goes too near a quick-running belt, and the first thing we know he is a subject for the surgeon or undertaker. Well, the writer remembers a man who was set at work running a circular saw. This man was mortally afraid of the saw, and kept as far from it as possible. For 23 years the saw was operated by this man without accident, until one day he dropped his rule beside the saw, and attempted to pick it up without going back to the table. He got three fingers and his thumb cut off, all through a little laziness in not taking proper pains against accident.—*Journal of Commerce.*

IRON SLEEPERS IN FRANCE.—After hesitating for some time, the French railway companies appear to have come to the decision to give the iron sleeper a fair trial. Extensive orders will shortly be given out by the various railways for cross-ties of that material. The Chemin de

fer Paris-Lyon-Mediterranee has already ordered 35,000 sleepers of the Vauthier section for its railways in Algeria. The Chemin de fer du Nord has, in consequence of the favorable results obtained with the Sversc sleeper on its Belgian lines, invited tenders for 10,000 sleepers of that pattern, and further orders will probably follow. The other French companies appear to be moving in the same direction, and are experimenting with metal sleepers in various sections. The French administration of State railways is taking the lead, and has ordered experiments to be made with iron sleepers on an extensive scale, which will tend to determine the practical value of the several systems advocated. The influence of this new departure upon the French iron trade in particular will be unmistakable, and impart the much needed activity, for with the iron industries of other countries, that of France has suffered considerably from the prevailing depression.

The Fly-Wheel.

While most people who know what a fly-wheel is have a general idea what it is for, a minute knowledge of its functions and how they are accomplished is much less universal. A very good idea both of its office and how it should be proportioned to it may be gathered from imagining oneself trying to run a foot-lathe with an extremely light fly-wheel. The motion of the machine would be jerky, the speed being excessive when pressure was applied to the pedal, and immediately slowing up because the fly-wheel did not possess momentum enough to carry it at speed up to the point where pressure again applied would tend to help it onward. A double-acting engine of the ordinary type has two chances to push the fly-wheel at each revolution. Even when steam is carried the full length of the strokes the forward tendency upon the fly-wheel is not uniform, owing to the irregular action of the crank and connecting rod. When these are in line, or the engine is on the center, any amount of pressure upon the piston will not tend to turn the wheel, and as the engine moves forward the effect of a given pressure upon this wheel gradually increases toward the middle and decreases again as the piston approaches the end of its stroke. When an engine is considered in which the steam is cut off at one-fifth of the stroke, and in addition to the above irregularity a varying pressure is introduced, it will be seen that the impelling forces as applied to the fly-wheel is somewhat irregular.

A mass in motion always contains an amount of force in inertia, which may be expressed in foot-pounds. When we run a foot-lathe, as considered above, we apply enough energy during the downward motion of its crank to run it for a full revolution, i. e., not only to drive it down but to return it, while no force is being applied without too material a reduction of speed. When an engine is properly designed, the fly-wheel is considered with reference to the speed at which the engine is to run, and made of such weight that when the engine changes its speed from its highest to its lowest running speed, i. e., its speed with no load and with its heaviest load, it will give out foot-pounds enough of force to keep the engine in motion up to speed until the governor has had a chance to adjust itself, and the increased pressure of steam to get to work. For instance, suppose an engine running without load at 100 revolutions to have a load suddenly thrown upon it. The speed of the engine will be slackened, but the fly-wheel, in lowering its speed two per cent, will give out foot-pounds of work enough to keep the load going until the pressure has adjusted itself to the new load. Viewed the other way, a fly-wheel may also be so heavy as to be sluggish in responding to the governor's action, and we can see the error of applying wheels indiscriminately, and also that there is a proper speed for a nicely designed engine to run, and any material departure from it will interfere with the accuracy of its work.

The accurate determination of the weight of a fly-wheel, with all the moving parts which affect it, involves considerable figuring. Approximations have been made for ordinary use. Watt made the fly-wheel to store up the work of $\frac{7}{8}$ strokes. Bourne advises that it should store up the work of six strokes, and modern practice upon engines of fine regulation rates higher than either.—*Boston Journal of Commerce.*

MECHANICAL TESTS.—The Department of Mechanical Engineering of the University of California is now prepared to test materials for tensile and compressive strains, elongation and limit of elasticity. All tests which yield results of practical value to the public at large will be made gratuitously, and the right is reserved to publish or exhibit the results. Tests will not be made when, in the opinion of the professor in charge, the object does not appear of sufficient importance to warrant this expenditure of time and labor.

CARBOLIC ACID is now recommended for moistening the tools with which metals are worked. The efficiency of the grindstone is even said to be increased by the use of the acid. The dark and impure acid can be used for this purpose.

TO REMOVE VARNISH FROM PAINT.—To remove varnish without injuring paint, brush on spirits of ammonia or hartshorn, which softens the oil, allowing of its being rubbed off easily.

SCIENTIFIC PROGRESS.

The Locomotive as a Weather Indicator.

An English observer says that the manner in which waste steam from a traveling locomotive conducts itself after leaving the chimney indicates very accurately the amount of moisture in the air. He says:

"Does the vapor linger in the atmosphere as if undecided whether to disappear or not, then saturation point is not far away. On the other hand, if it is snatched up with avidity, depend upon it, it is a dry day, with no chance of falling rain. Dwelling within a league of one of our main lines, I can testify of these variations from numerous observations. I have seen, on a hot summer's day, passenger trains rising an incline near our station, and therefore under full stroke of steam, without giving the slightest indication of their motive power, vomiting no smoke at the same time. At another time I have just had time to detect it ere it vanished. At others it has been visible for three or four yards, then for the whole length of the train, and so on, finely stretching, on damp and wet days, a long distance away. I have seen, in the height of summer, steam hang about considerably, with large patches of blue sky overhead—a curious revelation to me at first. Indeed, this hygrometer is a very delicate informant."

"And some of the daily variations are not less remarkable. Working in a hayfield one day last summer, adjoining the railroad, I was determined not to let the opportunity slip by. Up to 1 o'clock each passing train had given a gloomy appearance, which seemed likely to continue, the sky being overcast, while the hay or grass refused to be made. But, somehow, soon after the sun burst forth, the sky grew clear, and the trains began speedily to prophesy, if it can be called so. Gradually the steam disappeared, the afternoon became exceedingly hot, and never did hay make faster. It was carried in that day; of course, there was the same moisture in the air as before. The sun, in raising the temperature of the atmosphere, had made all the difference in giving it greater absorptive powers. A fortnight in the early hay season of last year was declared by this test to be phenomenally dry. Washerwomen and farmers, please note when living near a railroad."

This observer's conclusions seem very reasonable, and they could probably be verified by the observations of others. Without doubt, some of our readers have noticed something of the same kind. If they have, their observations may be of interest to others, and we would be pleased to hear from them.

STILL ANOTHER "NEW" EXPLOSIVE.—THIS TIME FOR COAL.—"Securite" is a German invention for an improved, cheap and efficient blasting powder, made out of the by-products of coke ovens and gas works. It is, weight for weight, more powerful than gun cotton, and very much cheaper than dynamite. It is in two forms, and the chemical composition of both may be thus described: Its first form is a mixture of dinitrobenzene or trinitrobenzene with ammonium nitrate, and its second form either dinitronaphthalene or trinitronaphthalene with ammonium nitrate. The powder is granulated, of a light-yellow color, with a smell like that of bitter almonds. When brought into contact with fire it burns, and, while burning, melts, giving out a yellow flame with little smoke. This flame is extinguished when the powder ceases to be in connection with the fire. No blows ignite it, and it can only be exploded with a 1000-gramme cep. From a large series of tests it has been conclusively proved that securite may be safely exploded in the presence of fire-damp and coal dust, and even when used where 10 per cent of fire-damp was mixed with the most dangerous coal dust no flame appeared. It can be safely carried from place to place, and the English Government has authorized its importation.

THE STORAGE OF ELECTRICITY was the subject of a lecture recently delivered by President Morton, of Stevens Institute, before the American Gas-Light Association. Electric lighting has been carried on successfully without storage, but only by the use of very accurate machinery, extreme care in its management and the use of a much larger plant than would be needed but for the fact that the electricity must be produced immediately before it is consumed. Such a system is, of course, very expensive, but thus far storage systems have been even more costly. Professor Morton says, however, that good storage batteries are now produced, and that their convenience will make a market for them in spite of their cost. They are particularly useful in regenerating the work of a dynamo, providing a steady current in spite of the variations in its work. They are used, also, where expense is no objection, for the lighting of private houses by electric light, a gas engine furnishing the power and the electricity being stored during the day for use at night. Professor Morton tells of storage battery cells that have been in use for two years without deterioration, except from causes which may now be avoided.

SOME ALLEGED NEW ELEMENTS.—A. Pringle claims to have discovered six new substances in

some lower silurian rocks in Selkirk. Five are said to be metals, and the other is a substance resembling selenium, and which he calls hesperium. One metal is like iron, but does not give the rhodanate reaction, nor that with tannin. Another resembles lead, is quite fusible and volatile, and forms yellow and green salts; another is black, and he names it arebodium; the fourth is a light-gray powder, and the last is dark in color. For three of these elements, the author assigns the equivalents 95.4, 43.6 and 74.

A SINGULAR ACCIDENT.—The newspaper, *Fire and Water*, relates a singular accident, which came near being serious. In a dyeing establishment near New York City a man was cleaning a flannel gown in a tub of beezoe, fully 100 feet removed from a flame of any kind. He was simply rubbing the garment with his bare hands, when, as he describes it, "suddenly the whole tubful of stuff went up in a blaze," and he escaped death or serious injury only by an instinctive and instantaneous backward leap. The friction caused by handling the flannel generated electricity, which ignited the vapors arising from the benzene. This, the editor says, is in its detail the first instance of the kind which has yet come to our knowledge, and the fire having been quickly extinguished by the employees, would probably never have been reported had not one of them casually mentioned it.

PECULIARITIES OF THE MERCURIAL THERMOMETER.—A mercurial thermometer held in the sun's rays, and not in contact with any other body, will show but little rise in temperature, the radiant heat being reflected from the bright surface of the mercury like light from a mirror. But if the bulb be coated with lampblack or some absorbent of heat, a rise in temperature will be indicated at once. So the heat rays from the sun may be passed through lenses of ice and concentrated to a sufficient degree to ignite combustibles placed at the focus, without melting the ice of which the lens is formed.

ENORMOUS SNOWFLAKES are recorded as having fallen Jan. 7, 1887. A writer in one of the magazines publishes measurements of single flakes $2\frac{1}{2}$ inches in length, $2\frac{1}{2}$ inches in length, $2\frac{1}{2} \times 2\frac{1}{2}$ and 3 inches thick, and even $2\frac{1}{2}$ and 4 inches in length. When melted, the largest one yielded 16 drops of water, and many gave 14 or 15 drops. The storm was only a few minutes in duration. These unique results can only be accounted for by the fact that the temperature was 32.6° Fahrenheit, and hence several ordinary flakes might become congealed to form a larger one.

A LONELY FLOWER.—On Mount Whitney, the highest mountain in California, at a level of 14,000 feet above the sea and 1500 feet above the timber line, where there is no soil and no moisture save snow, and hail, and ice, there grows a little flower shaped like a bell-flower, gaudy in color of red, purple, and blue. It is called Jacob's ladder, and its fragrance partakes of the white jasmine. It blooms alone, for it not only has no floral associates, but there is no creature, not even bird or insect, to keep it company.

HOW ELECTRICITY IS ENGENDERED IN A THUNDER STORM.—Sohneke states that the electricity which is discharged during a thunder storm is produced by the friction of water and ice, that is, that the ice is electrified by friction with water. Just before a thunder storm water clouds (cumuli) and ice clouds (cirri, cirrostrati) appear simultaneously in the sky. The friction of these particles of ice and water is a sufficient cause of the electricity which is generated.

A VALUABLE RECIPE.—The true French polish is one pint of spirits of wine added to a quarter of an ounce of gum opal, the same of gum arabic, and one ounce of shellac. This polish is used for plain wood that has been stained in imitation of natural wood. The principle of action is the floating with oil the gummy or resinous substances into the pores, and bringing the polish up by rubbing. The simplest varnish is a solution of shellac dissolved in naphtha.

MOUNTAIN AND CITY ELEVATIONS.—The Rocky mountains rise at various places to a height exceeding 11,000 feet. Of the 20 most famous passes, only seven are below 10,000, while five are upward of 12,000 feet; and one—the Argentine—is 13,000 feet. Of the 73 important towns in Colorado, only 12 are below 5000 feet, 10 are over 10,000 feet, and one is 14,000 feet.

EVERY INSECT HAS ITS USE.—Mary E. Tousey, on the study of insects in the *American Teacher*, concludes that every insect has its use in the world. Many live very romantic lives—some are wanderers and some are social in their habits; all are wonderful. It is possible for us to discover the secrets of their lives and the mysteries of their homes, if we carefully study them.

APPLICATION OF ELECTRICITY TO A WEAVING PURPOSE.—A manufacturer of Roubaix has invented a very curious application of electricity to looms. He adopts an indicator which strikes when a thread breaks, and thus saves the weaver from the close attention to the quickly moving threads which is so injurious to the sight.

ENGINEERING NOTES.

The Hudson River Tunnel.

After a resting spell of four and a half years, this great undertaking has been again opened, and one of the headings is being extended as rapidly as possible through the bed of the Hudson. Although all of the four headings will be worked simultaneously, the principal endeavor will be to complete and open the north tunnel, which is about two-thirds finished. The method of building this tunnel has not been changed. Compressed air is relied upon to keep the heading free from water, and the tenacity of the wall of silt is depended upon to separate the air and water. The heading is excavated as fast as the plate-sheathing and masonry can be put in, while the pilot is kept from 15 to 20 feet in advance of the heading, and thus serves as an explorer into the nature of the material ahead.

The work is of decided interest from an engineering point of view, as it introduces, and, what is more important, practically tests a new and novel system of tunneling, which, so far at least, has proved to be efficient and economical. The tunnels, once completed, will be invaluable to the commerce of this city, and they will provide sure and rapid connection with all the great railroads terminating on the west side of the Hudson river, opposite this city.

We understand that all the capital necessary has been secured, and all financial stumbling-blocks have been removed. We congratulate Mr. D. C. Haskin, the inventor of the system employed in the tunneling, upon his indomitable energy and perseverance in surmounting the many difficulties he has encountered, and hope that his anticipations in respect to the result of his grand engineering enterprise will be fully realized.—*Scientific American*.

THE ENGINE OF THE FUTURE.—Mr. Angus Sinclair, editor of the *National Locomotive and Car Builder*, delivered a lecture recently, at Cedar Rapids, Iowa, before the employees connected with the Burlington, Cedar Rapids & Northern shops. After referring to the attainment to the highest degree of perfection in an engine by effecting the transportation of steam into work, the speaker continued by saying that the great object sought was to make an engine which used the least steam and required the least repair. The locomotive engine while it is imperfect in its use of steam, yet compares favorably with other engines. He spoke at some length of the great difficulties of getting the motive power economically out of coal. Electricity has of late years been forced to the front as a motive power, although it is not itself a prime motor like the locomotive, wind and water, gas and hot-air engines. Electricity must first be developed by the use of an engine and dynamo. At present we are compelled to use coal to develop steam with which to move the engine by which the dynamo is driven. About 50 per cent of the motive power of steam is consumed in the transmission to the dynamo, and thus is seen the great waste of steam in the production of electricity. If electricity could be generated without the great expense of steam as now required, a great saving would result, but under the present process but little more than five per cent of the coal used in our furnaces is now put to work and utilized in the moving of machinery. Thus it will be seen that the great aim in the manufacture and management of engines is to get the largest percentage of the coal converted into working power.

RAILROADS IN INDIA.—The first railroads in India were modeled on the English lines and were very solidly and expensively built, but experience has taught Indian engineers that, with the exception of a few important lines of traffic, such roads could not be expected to return interest on their cost, and there has been a gradual reversal of the original method and a substitution of a cheaper style of road. The old methods still survive to some extent, however, and in the last year or two some very expensive works have been undertaken. River crossings have always been among the most difficult problems with which engineers in India have had to deal, and there are probably few countries in the world with an equal mileage of railroad which have more large and costly bridges. More than one of these, it is claimed, could well have been dispensed with, and the capital applied to the building of needed branches and extensions. Steam ferries for the transfer of trains are now taking the place of expensive bridges, and it is only when the traffic becomes heavy enough to warrant it, or where circumstances are especially favorable, that the question of building a bridge is considered at all.

GREAT ACTIVITY AT BRIDGE WORKS.—More bridge work is projected at this date than ever in the history of the country. Two are projected across the Hudson, six across the Mississippi, two across the Missouri, a \$10,000,000 bridge across the Potomac, 4600 feet long, besides a multitude of smaller bridges. The bridge works are constantly overrun with work, and bridge iron-makers are unable to accept all the business offered. Four bridge-building works are projected, and an expansion of mill capacity is going on.

USEFUL INFORMATION.

How to Use Glue.

All the glue, as received from the factory, requires the addition of water before it will melt properly, and every addition of water (while the glue is fresh made) will, up to a certain point, increase the adhesiveness and elasticity; and it is the duty of every man who uses glue to find out just where the point lies, as it is possible to melt glue and have it so thick that after it is dry or set it will be so brittle as not to adhere to the wood. Some glue will bear more water than others, but all will bear more water than usually falls to their share, and that, too, with a greater increase in the quality of the work. For glue to be properly effective it requires to penetrate the pores of the wood, and the more a body of glue penetrates the wood the more substantial the joint will remain. Glues that take the longest to dry are to be preferred to those that dry quickly, the slow-drying glues being always the strongest, other things being equal. For general use no method gives so good results as the following: Break the glue up small, put into an iron kettle, cover the glue with water and allow it to soak 12 hours; after soaking, boil until done. Then pour it into an airtight box, leave the cover off until cold, then cover up tight. As glue is required, cut out a portion and melt in the usual way. Expose no more of the made glue to the atmosphere for any length of time than is necessary, as the atmosphere is very destructive to made glue. Never heat made glue in a pot that is subjected to the direct heat of the fire or a lamp. All such methods of heating glue cannot be condemned in terms too severe. Do not use thick glue for joints or veneering. In all cases work it well into the wood in a similar manner to what painters do with paint. Glue both surfaces of your work, excepting in case of veneering. Never glue upon hot wood, or use hot cauls to veneer with, as the hot wood will absorb all the water in the glue too suddenly and leave only a very little residue, with no adhesive power in it.

THE PHILOSOPHY OF SHOE-BLACKING.—The *Waverly Magazine* discourses as follows upon the philosophy of the very prosaic subject of blacking shoes: "Did it ever occur to you," said a chemist, "what a remarkable and unique process the blacking of a boot is? You see, he smears the boot with a preparation of bone-black, which is entirely devoid of luster, and then by the friction of a dry brush makes it shine like the sun. There is not another process like this anywhere in the arts, so far as I know, and I never read anywhere any scientific explanation of the process. I have a theory of my own, however, which I will give you for what it is worth. The key to the mystery lies in the fact that diamond is nothing but crystallized carbon. The blacking is little more than carbon paste, and the friction of a hairbrush, being one of the most efficient methods of generating electricity, has the effect of crystallizing the carbon of the blacking. As soon as this is done the boot is covered with millions of infinitely small diamonds, and, of course, begins to shine like diamonds in your shirt-front. Of course this is not a perfect explanation of the phenomenon. What part the other ingredients of the blacking play, and especially how it is that the blacking must be moistened, I cannot tell; perhaps some one else can. But I feel pretty sure that these boot-blackers are engaged all day in turning blacking into diamonds."

PROTECTING ANIMALS FROM FLIES.—At this season of the year the annoyance caused to animals by flies and mosquitoes often amounts to positive agony, and at all times, in what is called good corn weather, it is sufficient to prevent the stock eating enough to keep them in good condition. The animals will stand in the water or pass the greater part of the day in the shade, rather than expose themselves to the sunshine, going out to eat only when driven by hunger. They quickly lose flesh, the flow of milk shrinks, and a loss is incurred that cannot be easily made good again. At all times a good feed of grain is beneficial to stock, but it is especially so when flies are very annoying, since it will do much to prevent shrinkage of flesh and milk. Horses and milch cows may be protected, in a great measure at least, by wiping them all over with a sponge dipped in soapuds in which a little carbolic acid has been mixed. Bulls confined in stables often suffer enough from the attacks of flies to drive them half mad, and there is no doubt that the continued fretting caused in this way develops a savage disposition. The most satisfactory results have followed from sponging, with soapuds and carbolic acid mixed, a Jersey hull confined in a stall.—*Chicago Tribune*.

BIRDS AS WEATHER ANNOUNCIATORS.—Quite a number of birds announce the coming of rain: for instance, the magpie, the owl, the yellow thrush, and the greenfinch. This is also done by means of peculiar notes which they never sound on other occasions. Nicolardot has said to reproduce these notes by letters. There are also storm-birds, so called *procellaria*, which in a similar manner—that is to say, by the use of certain peculiar sounds—predict the coming of a storm, even a long time in advance. Birds thus can feel and announce the coming of rain

and storm, and the ancients ascribed to them the faculty of prediction. In their flight and in their voices indications of coming events were sought. The augurs of old had established a whole science of the flight and the voices of birds. Nor is it improbable that training was resorted to, to aid in procuring such predictions—that is to say, to create favorable or unfavorable omens, which might happen to best suit the plans of the priests at the time. Louis Napoleon, in our nineteenth century, intended to convince the French people, by the aid of a trained eagle which was to have alighted on his head at the right moment, that he was the predestinated successor to his great-uncle.

TO CLEAN FEATHERS.—Make a lather of curd soap, boiling water and pearlsh; when it is a little cool, wash the feather in it, gently squeezing it. Wash it again with less lather, and then rinse it in cold water, shaking it well before the fire, but not too near. Curl it by drawing each fiber over the blunt edge of a fruit-knife. If the color is not good, use a little blue in the rinsing water.

BALLOONS FOR CHINA.—Two balloons ordered by the Chinese Government have just left Marseilles for Tientsin, accompanied by a French aeronaut, who is to teach the Chinese officers how to manage them. One balloon is 6000 cubic meters (2,118,000 cubic feet) in volume, and the other 3000 cubic meters. They are evidently to be used for war purposes.

WASHING LAMP CHIMNEYS.—Housewives should not waste their time every morning in washing lamps and chimneys, but should rub the lamps with an old piece of flannel, and hold the chimneys over a kettle of hot water until they are steamed well, then rub quickly with a dry cloth.

A MILK-FED POMPKIN.—One of the peculiarities of a 250-pound pumpkin grown at Newburgh, N. Y., is that it was fed on milk. A root was sent out from the vine to a basin of milk, and it consumed a pint of the fluid each day.—*Chicago Times*.

GOOD HEALTH.

The Cancer Discussion.

We this week place before our readers another case of cancer, in which the treatment appears to have been very successful.

Mrs. M. A. Meroer, age 54; five children, youngest 20; residence 303 Van Ness avenue. No cancer in family. Five years ago was crushed by fall from a wagon; a lump, size of hazel nut, remained after discoloration had disappeared; no pain at this time; health failing; glands not enlarged. Eighteen months after, attended by Dr. Bazan; he pronounced it cancer and proposed to remove breast. Dr. Sawyer said: "It is a cancer; the sooner you get rid of it the better." Dr. Kane said: "It ought to be taken out." Dr. McLean said: "The sooner you get rid of it the better." Dr. Murphy: "Should be taken out." All these medical gentlemen pronounced it cancer. The patient would not submit to an operation, so determined to apply to those who proposed to cure cancers without a knife. Lump in breast was now the size of hen's egg, painful and growing more so, and larger. Heard of a Chinese who claimed to cure without operation; six weeks with him; obtained no relief. Went to Franklinberg, who tried to cure her by plasters and caustic, but only caused pain; no relief. Went to Kelly Tiggs, who claims to cure without a knife; attended with him for three years; suffering great pain at times, but getting worse all the time, when she heard of — placed herself under treatment February 22, 1886, and left off attending May 15, 1886. Suffered no pain when under the care of —, and improved steadily right along. Breast healthy; looks and feels well.

Will the medical gentlemen above named deny that this was a genuine case of cancer? or did they all make a mistake in their diagnosis? Is not human life and suffering worth an hour's time on the part of one or more of these gentlemen to determine the truth in this case? Are medical ethics of more importance than human life?

REGULAR EXERCISE.—It is generally admitted, but not always acted upon, that, second only to the nourishment of the blood by food, regular exercise regulates the action of all the vital organs. Exercise which is undertaken spasmodically and at uncertain intervals is injurious rather than beneficial. Judicious exercise for brain-workers is that which causes the blood to flow freely, and affords a change of position and action to the cramped and wearied muscles, in addition to some slight interest calculated to insure a change of thought and consequent relaxation to a tired brain. It should be taken out of doors and in the sunshine, if possible. The best time for gentle outdoor exercise seems to be about mid-afternoon, if it can be taken without exposure to excessive heat, the sunlight having chemical properties which act tonically upon the system. Early-morning exercise has been favored, but it is as much to be reprobated as early mental or physical labor, because at that time vitality is at its lowest ebb, and it needs stimulation rather than further depletion. Failing open-air exercise, absolute purity of the

surrounding atmosphere is imperative, because its respiration furnishes to the blood that quantity of oxygen necessary to the process of destructive assimilation which restores vitality and tones the nervous system. The condition of the nervous system affects the secretion of the gastric juice, and, of course, its deficiency occasions impaired digestion. When one has been writing several hours in a badly ventilated room, or in one lighted with gas, exercise in pure air is required to supply the blood with oxygen, and thus prepare the way for the proper nutrition of the brain, nerves and muscles from the next supply of food.

The Weak Points in American Constitutions.

From the vital statistics which Dr. Billings has classified, the appearance is that the respiratory machinery is the feeble point in the American man and woman, or any man or woman who endeavors to live in our climate. Diseases of the lungs and diseases directly related to pulmonary disorders are out of all proportion to any other in their fatality. Consumption is the disease which, taken separately, kills more persons per thousand of the population than any other one disease, and pneumonia is next to it. Consumption kills 91 per 1000, pneumonia 63 per 1000, and the largest number per 1000 to which any other malady is fatal is 38. But if we class together consumption, pneumonia, heart disease and bronchitis, the fatality of this group is 191 per 1000, which simply shows that the respiratory organs are the dangerous spots—the points in our vital fortification through which the enemy gets in with greatest facility and where he does most harm. Consumption is, it is true, classed as a general or constitutional malady; but many forms of disease that are classed as consumption are especially diseases of the lungs or their plural envelopes, and all are fatal through their ravages upon this organ.

What are the causes and what is to be the consequence of the fact that the statistics thus make out? No doubt our terrible climate is the first cause. Over a widely extended part of this country the thermometer ranges from season to season through 110 or 120 degrees of the Fahrenheit scale. We have in the same cities a Russian winter and an Italian summer, and as neither high nor low temperature; but the capacity to withstand great changes from one to the other is the true trial of vital force. Our people are exposed to such a test as none other is ever called upon to endure.—*New York Mail and Express*.

EXPERIMENTS WITH TAPEWORM EGGS.—Some weeks ago this distinguished scientist, Dr. F. Zschokke, and ten of the students at the zoological laboratory, Geneva, undertook a heroic experiment for the purpose of studying the development of tapeworms in the human system, to which end they swallowed the eggs of the repulsive parasite. From every part of Europe they received letters of approbation and encouragement—one single letter only blamed them for having made the dangerous experiment, and this came from the president of a society for the prevention of cruelty to animals! The eggs had been taken from a variety of fishes known or suspected to be the transmitters of tapeworm. For nearly two weeks all went well; but in the course of the third week the presence of the unpleasant guest manifested itself plainly with most of the experimentalists. In every instance a complete removal of the parasite was effected, the specimens extracted varying in size, two or three reaching a length of two meters. Dr. Zschokke is about to publish the result of his experiment.—*New York Tribune*.

THE DURATION OF A GENERATION.—The duration of a generation is the average length of life for man. That is, though, of a million of human beings born in a generation, some will die in infancy and some will live to old age, the average life for the entire number will be about 33 years. This is arrived at by averaging the ages of all persons, old and young, dying within a term of years. Different localities, different periods, will of course alter the result, but the average for the race in civilized countries is always approximately the same. The average age of population is a different thing. This is the average age of all persons living at any one time, ascertained by summing the ages of persons of different age as given by a census of the population and dividing this by the sum total of the population.—*Inter-Ocean Queries*.

PROFESSIONAL FATIGUE.—Medical and other professional men often break down from their inability to keep a regular time for meals. An eminent doctor says: Being often out for many hours, and becoming too exhausted to digest a full meal when at length able to get it, I conceived a plan which answered admirably well, and which other doctors have gladly adopted. I provided myself with a small bottle of lime-water, which I add to a glass of milk when passing a dairy shop; or I put a small flask of the mixture in my pocket. A water biscuit with this will keep a man harmless on a long fast, and enable him to digest a meal when he can obtain it.

HOW TO COOK FISH.—Experience in a Glasgow hospital has taught Dr. J. S. Nairne that boiled or fried fish is a dangerous diet for weak persons, but that steamed fish is harmless.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Ledger, May 29: The water in the Wildman mine has been taken out to the 300-foot level. The hydraulic pump is working nicely. Work has commenced on the North Star claim. The Amador canal has been giving a good deal of trouble in the past two weeks. It broke again yesterday, which will likely stop some machinery for a short time. The steel pipe for the Plymouth line of ditch is completed and laid. S. N. Knight has just returned from a visit to the Lambing claim, where he found his patent dredger in operation, and giving entire satisfaction.

VALPARAISO.—Ginocchio Brothers have bonded this promising mine to L. C. Taylor, a mining man of North Carolina, who represents a large amount of Northern capital. The bond, we understand, is to the effect that the purchase money is \$60,000 to be paid on or before October 1st of this year; the first installment to be paid in 30 days after date of bond. The Valparaiso has developed splendidly of late.

MISCELLANEOUS.—The 60 tons of ore from the Griesback mine in Pioneer district has been crushed at the Dane mill, and yielded 30 pounds of amalgam, so we are informed. It is thought that the gold product from the amalgam will be at least \$4,000, which would give an average of \$60 per ton. The two-stamp mill on the St. Julian mine at Middle Bar has been sold to A. J. Sargent, and will shortly be moved on to his mine near by. Underground work at the Little Amador has come to a standstill. The rock taken from the mine yielded about \$5 per ton. It was lower grade than was generally supposed. John I. Minear has bonded the Wetzlar mine in Hunt's gulch. The Amador gold mine has let a contract to sink the main shaft another 100 feet. This will carry it over 300 feet deep. The Huntington roller quartz-mill on the McKenzie claim, near Irishtown, has started up.

NEW LONDON.—Amador Ledger, May 27: This week we paid a visit to the New London mine, half a mile south of Plymouth, and were shown around the works by H. Reese, the superintendent. The mine is owned by Messrs. Ballard & Martin of San Francisco, who have also secured adjoining claims, giving them a stretch of over a mile of territory along the mother lode. As many grossly exaggerated reports have been circulated concerning the recent strike of rich ore in the shaft now in process of sinking on the New London property, it is well to state the true facts in relation thereto. There is a vast pile of good milling ore on the dump, every pound of which is intended to be worked. Indeed the ore pile is larger than the waste dump, which shows that the shaft has been more or less in ledge matter all the way down. It is in four feet of quartz at present. The entire dump is estimated to average from \$12 to \$14 per ton. When the shaft had reached about 900 feet deep, ore, richer than any that had heretofore been extracted, was encountered. The reports about a wheelbarrow full of gold being taken out were calculated only to mislead. The rich ore was not chunks of almost solid gold, but consisted of two feet of fine-looking ribbon rock, carrying a large percentage of sulphurets, and also showing streaks of free gold. Assays of this rock gave \$300 per ton in free gold, and over \$600 per ton as the value of the sulphurets, making a total of nearly \$900 to the ton. The sulphurets are the richest found in the county. It is the same kind of rock met with in the Pacific, the Keystone, and the South Spring Hill, also the old Eureka, of Sutter creek. As far as we can find out, this character of ore has never been known to be of a mere pocket nature. Of course the ledge varies in richness. The shaft of the New London is now down over 1000 feet. The new shaft, over 500 feet from the main shaft, is progressing rapidly. From 25 to 30 men are at present employed about the two shafts.

BUNKER HILL.—This mine is looking better than it has looked for years. The shaft has reached 800 feet, but the ore in the lowest level is of inferior quality and not being worked to any extent. At the 600-foot level at the south end of the mine, a large body of high-grade rock has been discovered, and it is from this level that the mill is mainly supplied.

Calaveras.

HANDSOME SPECIMEN.—Calaveras Chronicle, May 28: We were shown a fine specimen of gold taken from the Concentrator gravel mine the other day. The chip was valued at \$35. This mine is turning out to be a valuable piece of property. Over 30 men are employed in the mine, the fine ro-stamp mill is kept constantly running on rich gravel, and the deposit is apparently inexhaustible. New boarding-house, lodging-house, blacksmith shop, stable, and a nicely furnished and convenient superintendent's office have all been constructed recently. Under the thoroughly practical management of the superintendent, Mr. C. M. Burleson, everything is running like a charm.

WEST POINT.—Calaveras Prospect, May 27: About 20 men are employed in the Scorpion mine. The superintendent, John McLaughlin, is well pleased with the present outlook of the vein. The shaft is down 200 feet, and the company intends to sink another hundred feet in a short time. About 10 tons of good milling ore is taken out in 12 hours. Very rich rock has been discovered in the Lockwood mine near West Point, and the discovery has created quite an excitement. F. Novella has a good prospect near West Point. He has a patent to the mine. Two shafts have been sunk 100 feet each, and a drift between the two of about 80 feet. Last Tuesday a body of ore was found in drifting north from the main tunnel, which contained considerable free gold.

SHEEP RANCH.—Cor. Calaveras Prospect, May 27: Operations at the Wood mine have been delayed for some time in consequence of the absence of machinery ordered some time ago. It is thought that it will arrive the present week and then the work will be resumed.

El Dorado.

SPRINGFIELD.—Mountain Democrat, May 28: The Springfield is making preparations to sink the shaft to 1600 feet. Superintendent Poundstone is

bound to find what is at the bedrock of the fine quartz lead in this property. We understand that there is a 12-foot vein at the 1400-foot level. The Confidence, in Cedar ravine, recently opened, made its first cleanup this week, with good results. Thos. Davidson has made a cleanup at his mill near El Dorado, after a three weeks' run, and reports he did well.

MOUNT PLEASANT.—Placerville Observer, May 31: Jas. Ray, lessee of the Mount Pleasant mine, at Grizzly Flat, bought from W. G. Shriver, of San Francisco, the hoisting works lately used at the Sunday mine. This, coupled with the fact that about 40 men are kept at work in the Mount Pleasant, does not seem to bear out the predictions that the old mine was soon to be closed down. B. Delony, of the Middle End mines, Grizzly Flat, says the mines are looking well and being worked full-handed. The lower tunnel at the Melton is in considerably over 1600 feet, exposing a large body of high-grade ore.

AT WORK.—El Dorado Republican, May 26: Work at the Gopher-Bowler mine is being vigorously pushed, and a large amount of money is being expended by Superintendent Pearson in preparing to work the mine. Hoisting works are to be erected, and a new shaft sunk on the Boulder ledge, which is an immense body of quartz, capable of running a large mill for years, if the rock proves to be rich enough to work profitably. A large quantity of iron pipe, track rails and other mining supplies have been ordered from this city and considerable building is to be done at the mine.

Fredero.

HILDRETH.—Fine Gold Miner, May 27: The Hildreth mill has been crushing from 10 to 12 tons daily. The next cleanup will surpass the first, as nothing but first-class ore will be crushed. Louis Wilson has been compelled to stop work upon his mine on account of the increase of water in the shaft. Machinery has been ordered from S. F., which will be here shortly, when work will be commenced on a larger scale. A. McFadyen and P. P. James left for S. F. on Saturday, to order machinery of greater capacity, the present hoisting works not being capable of doing the work. Upon an average width of a four-foot ledge the development consists of a 228-foot shaft, with east and west drifts at each 100 feet that extend 150 and 175 feet of crosscut on the pay chute. The Black Hawk Co. will resume operations as soon as a pump and boiler can be obtained. Development of the McNally mine is decidedly encouraging, especially in opening up higher grade ore in the east drifts. In the 500-foot tunnel of the Last Chance mine, owned by McKenzie & Rule, an extra quality of ore was opened up last week at the face. A stope will be started in a few days, from which ore will be extracted and hauled to their ten-stamp mill. John Davis, while sinking upon his ledge, opened up quite a pay chute of ore. The prospect is very good. Mr. Crossman was in town during the week looking up the location to erect a custom quartz-mill.

Inyo.

PROSPECTS.—Independent, May 28: Some very good mining prospects are being opened in new ground in the Beaveridge district, in the Inyo mountains. In one of these claims, the True Blue, owned by C. Maysan and others, of Lone Pine, the ore carries \$296 per ton in silver. A shipment of the ore was made a few days ago. Another claim, called the Big Treasure, is owned by the same parties. This is located not far from the White Hill mine, but on the other side of the ridge. A sample of 13 tons of this ore was shipped recently; it goes \$26.50 per ton in silver and 69 per cent lead. The vein is large and easily mined. This claim gives strong evidence of developing a very large ore body.

MARBLE.—At the marble quarries recently a block of pure marble was taken out that would weigh over 80 tons. The saws are at work cutting up this block for market. Behind where this block was taken out stands a ledge 20 feet high, and as far as can be seen, without a seam. The opening of this ledge will, it is believed, supply all the large blocks that may be needed for a century to come. The third layer has been cut through and a seam found at a depth of ten feet. Some fear was felt that no such seam would be found, thus making quarrying more expensive, but that is now dispelled. Some blocks of yellow and moss-agate marble have recently been sawed and both are beautiful. The fern-like figures in the moss-agate marble are from three to four inches in length. A carload of marble was shipped to San Francisco this morning.

Monterey.

GOLD.—Pleto Cor. Monterey Democrat, May 28: The gold fever has reached this portion of the country at last, and there is a general migration of citizens to the gold mines, which are in the Burro hills, 20 miles from Jolon. They were discovered by Mr. Cruikshank, who has already been offered \$50,000 for his interest. The gold in the quartz can be seen with the naked eye, and it is thought that it will assay \$2000 per ton.

Nevada.

EMPIRE MINE.—Grass Valley Union, May 28: The shaft of the Empire is now down to the 17th level, a station has been cut out and the drifts started. This level will open up a large body of ore when the drifts are driven up sufficiently for stopping. On the 16th level the north drift has been extended 400 feet, and is nearing the pay shoot that comes down from the 15th level. The main incline is also being sunk for the 18th level, the intention being to open up new bodies of ore as fast as possible in order to keep the mill running with the full head of 40 stamps. In a few months, when more ore will be accessible, the underground force will be increased to its former complement. The late discharge of a number of miners was owing to the upper levels not furnishing sufficient ore to keep all the stamps going regularly.

THE NEW ROCKY BAR MINE.—Foothill Tidings, May 25: Messrs. Francis, Fiddick & Co., late lessees of the Perrin mine, have taken a contract from the New Rocky Bar Mining Company to clean up and repair the original incline shaft, and to pump out the mine. As there is but little water in the shaft, this work will be completed in less than two weeks. Then the contractors will doubtless lease the mine, sink the shaft, and gradually carry on the work of development.

A PAYING MINE.—Foothill Tidings, May 27: Brockington Bros. & Co., lessees of the W. Y. O.

D. mine, have recently completed a crushing of 74 loads of ore. The yield was \$2176. The ore from this vein has from the beginning yielded about the same—\$30 per load. The ledge is in soft picking ground, the greatest depth of the workings being 93 feet, and it averages 10 inches in thickness. There's lots of it in sight. The boys have their own mill, which is of five stamps and operated by steam.

Plumas.

GRANITE BASIN.—Cor. Plumas National, May 28: The prospects for a lively summer in the Basin never were better. The mills will soon be making "mashes" on rich quartz. Mr. Christie has struck the Highland Chief, in the lower tunnel, and the quartz is of the best. Mr. Graves, while sluicing near his house, found some fine nuggets. Joe Peppin is running a tunnel on his ledge. The quartz looks fine, and it does not deceive its looks. Johnnie Chatly is in the Granite tunnel, and has struck it rich. See & Jolly are still working on the Specimen, and are hopeful of good results. Swan & Williams have out a fine crushing at the Homestake.

INOIAN VALLEY.—Greenville Bulletin, May 26: Mr. S. R. Prentiss, president of the Plumas Con. M. & Co., is now making arrangements to resume operations at the mine. The legal entanglements, caused by a difference between members of the corporation, have been adjusted.

CRESCENT.—The mill at the Crescent mine was started at the first of the week. Crosscutting continues. We are informed that a ledge has been struck which prospects well. This is in hard blue curly. Some have contended that a ledge could not live in such rock, but the contrary has been proven in the Crescent. Mr. Whitney, the superintendent, works the mine upon the economical plan, pays his men promptly at the end of each month, and will, we feel certain, develop a good mine at the Crescent.

GREEN MOUNTAIN.—For years this mine has been steadily running. At times prospects were not good, but by close attention to business, economy, and perseverance, Mr. Rodgers, the superintendent, has made the mine a success. It is generally understood now that the Green Mountain has superior ore, and that good returns are being obtained. There is good feeling among the friends of the mine, and it is quite certain that a prosperous future is before it.

THE DRURY.—Geo. Standart will have the Kettle mill ready this week. A new Pelton wheel has been put in, a new 20-inch belt supplied, and other necessary repairs made. The mill will be turned over to Mr. Drury, the lessee, and crushing will begin immediately. Ten stamps will be started. The mill is now full of ore, and hauling will be continued. Mr. Drury has a large mass of quartz. Add Nev. Co.

GRAVEL ELEVATOR.—Foothill Tidings, May 28: The North Bloomfield Company is about to start up its gravel elevator. The machine lifts the gravel 85 feet, takes the gold out and deposits the tailings in the old works of the mine, from which place the tailings cannot run into any stream or anybody's ranch. That machine, according to all accounts, has the stamp of legitimacy.

San Bernardino.

DRY LAKE DISTRICT.—Cor. San Bernardino Courier, May 28: Colonel Hall has arranged for the putting up of reduction works capable of crushing 20 tons of ore per day. They have a large part of the material for the mill already on the ground. Some 30 men are at work, and inside of six weeks the gold bullion will be making itself felt in your city. They have already on the dumps about 100 tons of ore that is said to assay over \$200 a ton in free-milling gold rock. There are a large number of small ledges in this district, and I believe it is the intention of Hall & Banta to buy up all ores, consequently it will be a large field for chlorides to make a harvest. Two Mexicans in three weeks' arastrating are said to have cleaned up over \$500 on the Wilbur mine. There are, however, a number of ledges ranging from one to three feet in width, that will yield large quantities of good ore on further development. The mineral-bearing ledges extend over an area of about nine miles in length and four or five in width. Water is plentiful anywhere around the mountain in the dry lakes at a depth of 16 to 20 feet, and of good quality. Victor, on the California Southern, is the shipping station for this district, and the camp is about 45 miles distant, having two good watering-places on the road, Rabbit and Old Woman springs.

Santa Barbara.

QUICKSILVER.—A party which has returned from the Santa Ynez mountains reports that the quicksilver mines of Los Prietos y Najalayeyua, 15 miles by trail over the mountains, will close down shortly, after many years' run. Out of 130 tons of cinnabar mined, the yield was only seven flasks of quicksilver. The mine is owned by a S. F. company, but is worked by Spanish lessees, who claim they have lost \$25,000.

Shasta.

SQUAW CREEK.—Shasta Democrat, May 28: Carson & Snyder have rented the Croesus quartz-mill on Squaw creek, and have a force of men at work in their mine, the Snyder, on which they have driven a tunnel over 400 feet. They have a pay chute 265 feet, with an average of 150 feet backs. They have cut out a station and will put down a winze, and also make an upraise. They will commence crushing rock to-morrow.

Sierra.

MILL.—Mountain Messenger, May 28: Theo. Smith intends to put up a 10-stamp mill at his quartz ledge, near Alleghany, the machinery to be furnished by the foundry of Geo. G. Allen, Nevada City.

A RICH STRIKE.—Sierra Tribune, May 27: The owners of the San Louis mine are in high spirits. Last Saturday one of the workmen came down from there with the news that exceedingly rich ore had been encountered in the lower tunnel. As a proof of the strike he brought with him a sack of quartz, which is of as fine a quality as we have seen for many a day. The ore is literally covered with gold, and contains sulphurets of high value. The San Louis is in Avalanche ravine, and was first discovered by Mexicans in early days, who worked it with profit to as great a depth as possible with the means then at hand. It was then abandoned, and remained idle until it was relocated, and operations

begun thereon by the present Sierra City company. They have expended about \$5000 in running tunnels. The rich strike made last week was in the lower tunnel, and is 200 feet in depth on the vein. The ledge is three feet wide and runs east and west. The owners will proceed to run ahead on the vein, and it is more than likely will conclude to erect a mill there this season. This is an important strike for our district.

THE MARGUERITE MINE SOLD.—The Marguerite mine and all personal property attached thereto was sold by the sheriff last Saturday to satisfy a judgment of \$105,000 obtained against it some time ago by Royal E. Robbins, of Boston. Mr. Robbins' agent was on hand with instructions to buy everything in. The mine was knocked down to him for \$46,000, while he "scooped" the personal property in for \$3700. As soon as the mine passes into the hands of Mr. Robbins he will, in all probability, start it up, at least his agent so hinted while here.

FROM DOWNIEVILLE.—Sierra Tribune, May 28: At the Wide Awake drift mine, which is situated at Alabama Hill, good pay gravel has recently been encountered. Fred Bosch and Wm. Hanson were the only men working there, but the company now proposes putting on several additional hands. The tunnel is in about 500 feet. Different parties have been engaged in prospecting this claim for a period of 15 years past, but heretofore there has always been a failure in discovering pay. Carry the good news all along the line that after running 1700 ft. of tunnel at the Gold Bluff, A. VanSlyke, the owner, on Wednesday had the satisfaction of gazing upon the long-sought-for ledge. The vein is one and a half feet in width and shows considerable free gold. The strike has occasioned much excitement here and on every corner knots of men are gathered discussing the affair. Mr. VanSlyke has carried on this work single-handed, and although at times things looked very dark he never for a moment has yielded or despaired, but has continued right along devoting his money and energies to the purpose of pushing the tunnel ahead to the ledge.

Trinity.

KNOW-NOTHING CREEK MINES.—Trinity Journal, May 29: Mr. D. Hansen returned this week from the mines on Know-Nothing creek in which he is interested, and reports the following: The company has eight men at work, and everything looks favorable. The ledge in the Hansen mine runs from a trace or seam to two feet and averages well. They are down about 70 feet. The last crushing went 550 to the ton. They are also stopping out ore from the Sugar Pine ledge, which, so far as they have gone, looks very flattering. They have heretofore packed all their ore from the dump to the astrata, but they have now about completed arrangements by which they will sled the ore.

NEW RIVER.—Work is going on at the Mountain Boomer, Arago, Tough Nut, Golden Eagle, Ridgeway, Uncle Sam, Sherwood, and Grover Cleveland mines. The Hard Tack will start up soon, also the Carrie and Mountain Belle. At the Hard Tack arastra they are crushing some ore from the Hunter and Hoo Chi Noo mines. Dean and Toms are crushing ore from the Ridgeway. The Uncle Sam mill will start up this week on ore from the Uncle Sam mine. Mr. Heley will start his mill up on St. Elmo ore soon. The Tough Nut Co. is building a wagon road to the Hard Tack arastra, intending to have their ore crushed there as soon as the road is completed. The Carrie Mining Co. is talking of putting in a three-stamp mill and rock-breaker, to be run by water-power, and is making surveys and estimates. Mr. Thos. Knight, of Arcata, one of the owners in the Arago mine, is well pleased with his prospects. The warm weather is taking the snow off from the high mountains, and prospectors are commencing to move around.

BULLYCHOO.—Trinity Journal, May 27: Mr. D. L. Smith, of Bullychoop, states that the mining interests of that section are daily increasing in importance. The recent discovery on the Mammoth is the most important yet chronicled in the history of the camp. A shaft has been sunk on the new ledge to a depth of about 20 feet, at the bottom of which the vein is seven feet wide and averages \$20 a ton. A tunnel has also been run, and the ledge tapped at a depth of 200 feet; this insures permanency and makes the property of great value. A ro-stamp mill is now in operation on the mine, and its capacity will be increased by 10 additional stamps as soon as lumber can be procured. In the Jerusalem mine, the Moon Bros. recently found a new vein which prospects well, but is not yet sufficiently developed to show its actual value.

Ventura.

OIL DEVELOPMENT.—Republican, May 28: Despite the views ascribed to a noted expert that the petroleum interests did not amount to very much, the development of the oil product by the Standard and other companies having large interests in the oil fields of Ventura county goes steadily forward. On last Wednesday the Sespe Oil Co., an organization composed largely of Los Angeles capitalists, started the pumps in its wells on Tar creek, 20 miles northeast of Santa Paula, and began the first run of oil, filling the 32,000-barrel tank at the latter point. When the oil reached a point about half-way to Santa Paula the pipes burst and the pumps were stopped as soon as word could be sent to the wells, although a great quantity of oil was lost by the operation. The pipe was repaired and the pumps were again started, the oil reaching Santa Paula early Friday morning. It required 200 barrels of oil to fill the two-inch pipe for the distance of 20 miles. The oil from Tar creek is light brown in color, and runs rather freely. On Friday the first run of oil was also made from Adams canyon, eight miles northwest of Santa Paula. The oil is darker, thicker and heavier than that from Tar creek and runs very slowly.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—Enterprise, May 28: On the 1200 level the south drift, entering from the Ophir mine, was extended 30 feet; total length in Con. California and Virginia ground, 180 feet. On the 1400 level west crosscut No. 1 from the south drift was extended 40 feet; total length, 174 feet. The usual quantity and quality of ore is being extracted from the new south stopes on this

level. The operation of injecting carbonic acid gas into the bulkheaded portion of the mine, for the extinguishment of the fire smoldering in the old timbers, is still steadily continued, and will be kept up until this gas is found to have risen above the fire. The usual quantity and quality of ore has been shipped during the week to the Morgan and Eureka mills, on the Carson river. The battery samples are showing about the same as last week. Since last report bullion to the value of \$79,751.92 has been shipped to San Francisco.

SAVAGE.—The winze below the 600 level has been sunk and timbered 12 feet, and are now engaged in putting in a station set at this point to open the 700 level. West crosscut No. 6 on this level (the 600) has been extended 18 feet and the south drift therefrom 19 feet, all the way in quartz. The east crosscut from the fifth floor above this level (600) has been advanced 45 feet. The crosscut west from the eighth floor was extended 25 feet. On the 800 level No. 1 east crosscut from the main lateral drift was advanced 22 feet. The upraise from this level in the quartz body has been extended 18 feet, and is now up 74 feet above the track floor of the level.

CHOLLAR.—Good headway is making in the drifts east and west on the 450 level, by means of which the Sharon shaft at the croppings and the old Chollar shaft will be connected. A number of prospecting drifts and crosscuts are being run to explore the ground on the various levels from the 100 down to the 1300 level. Some bodies of good milling ore are being opened up that promise to prove extensive. The ore extracted in making these explorations is stowed away in drifts and other openings on the levels where it is found. They have a fine deposit of ore on their 1300 level that is known to be eight feet in width; also, in other places are reserves of ore that can be extracted whenever it can be mined.

HAYWOOD.—The mine is looking well in every part, and an almost unlimited amount of ore might be extracted from the bodies now opened up could facilities for milling be obtained. On the 200 level they have a body of ore that is known to be over 30 feet in width. The greatest depth to which they have yet sunk on the vein is 200 feet, and all is ore from that point up to the grass roots. The Thompson mill is running steadily on ore from the mine.

GOULD AND CURRY.—On the 300 level the main west crosscut was extended 20 feet; total length, 113 feet. The north drift started last week from the main west crosscut, 140 feet west of the upraise, still continues to show well in quartz of a promising character. From the upraise in the old stopes, 50 feet above the 300 level, are drifting in various directions and finding some ore.

CROWN POINT.—Are extracting about 1600 tons of ore a week, and the ore-producing sections are still presenting a favorable appearance. Much prospecting is being done in all parts of the mine, and some new and very favorable deposits of ore are being opened up. The 450 and 550 levels are being opened to explore the downward extension of the ore body exposed on the 350 level.

MEXICAN AND UNION CON.—On the 1300 level the joint Union and Mexican drift running north-easterly was extended 23 feet. This drift is now 583 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 20 feet; total length, 475 feet. It continues in material composed principally of the vein porphyry usually encountered in this portion of the Comstock lode.

BALTIMORE.—On the 300 level the ore is increasing in quantity and improving in quality. A raise is being made in the vein above this level from which a considerable amount of ore is being obtained. The vein at this point is 50 feet in width. On the 400 level good milling ore is being extracted, and a crosscut is being run to get on the west side of the vein. Good milling ore is being found in the crosscut.

HALE AND NORCROSS.—On the fifth station level the north drift was advanced 38 feet, and the main south drift 26 feet. This south drift is showing some good ore. East crosscut No. 1 from the main south drift was advanced 30 feet. A portion of the Norcross force is still engaged in removing the rock from the Chollar incline, and in repairing the connecting drift on the 1300 level.

OST.—The mine continues to look well and is yielding a large amount of gold-bearing quartz of good quality. The explorations below the tunnel level have resulted in the development of a large deposit of ore that is of a better quality than was found above. The new patent whim is found to work well and gives satisfaction in every respect.

YELLOW JACKET.—Less than the usual daily yield of 200 tons has been extracted this week, owing to the temporary laying off of a considerable number of miners pending repairs to mills. The upper portions of the mine are being thoroughly explored, and some deposits of ore that will pay for milling are being opened up.

OCCIDENTAL.—In the upper tunnel on the 48 level the south drift from the north incline winze was extended 10 feet; total length, 240 feet. In No. 3 east crosscut the incline winze was sunk 10 feet; total depth on the slope, 95 feet. During the week 21 tons of ore were extracted from the winze and the south drift.

BEST AND BELCHER.—On the 1500 level east crosscut No. 1 is stopped. No. 2 was advanced 60 feet; total length, 845 feet. This crosscut is passing through vein material which shows some small stringers of quartz.

JUSTICE.—A large amount of ore has been opened up ready for extraction on the 400 level and at points above, and about 500 tons of good ore lies on the dump awaiting milling facilities.

UTAH.—On the 472 level the north drift from the main west drift was extended 40 feet; total length, 745 feet. The face still continues in vein porphyry, passing through clay slips.

BULLION.—The north drift on the 200 level is making good headway, and has been turned somewhat to the northwest. It is in vein material that yields low assays.

ALTA.—The west drift on the 825 level has reached the vein, and explorations are being made along the east wall.

KENTUCK.—About 50 tons of ore a day is being extracted. It comes from above the 1300 level. This ore is being worked at the Douglas mill, Lower Gold Hill.

OPHIR.—On the 1300 level, north winze No. 1

has been making good progress in low-grade ore, leaving the old stope timbers above on the east.

ANDES.—The winze on the 240 level is down about 20 feet, and is still showing some ore. The upraise from this level (near the winze) is also in ore of a fair quality.

Jackrabbit District.

THE ONONDAGA.—Pioche Record, May 24: The mine is low down in a small gulch at Royal City, and 1200 feet easterly from the Day mine. We found the dump and ore-house crowded with ore, several tons of which were sacked and ready for shipment. The history of the discovery of the mine is a brief one and can be given in a few words. A streak of lead, perhaps an inch or two thick, wedged rather tightly in a limestone crevice, was for years exposed to the elements, to the eyes of various prospectors, and also every one else who would take the trouble to give it a glance as they passed over in search of some more promising prospect. Eventually a prospector fooled with it a little, then he put in a few shots, and to his surprise the ore streak became thicker and of a much better quality as his work advanced. Then several men were put to work running a tunnel mostly on ore, the streak varying in thickness from one to three feet. This ore was fair in silver and very heavy in lead, was shipped to Salt Lake for reduction, and it netted its owners a fair profit. The tunnel was driven on the vein a distance of 60 feet, the vein averaging better in both quantity and quality as every foot was gained. A winze was then sunk from the tunnel level to the depth of 78 feet with a continuous ore body going down and developing the fact that the Onondaga was a contact vein with a porphyry foot and black lime hanging. Their upper workings had been merely in a fissure of the limestone cap, which, however, pointed to the true formation below. At the date of our visit an upraise was being driven to the surface, a distance of about 20 feet from the tunnel level, for the purpose of getting a good current of air through the mine. The upraise is in solid ore from which, in one week's work, four men broke down 20 tons.

ARIZONA.

MINES AT CHLORIDE.—Cor. Mohave Miner, May 28: At Chloride in every hole that we come to you will see a couple of men taking out ore and developing their mines. At that camp McCall and Hanson have started to work on the Nigger Baby mine with a fine prospect before them. At the Juno, owned by L. A. Sanderson, of S. F., leased to Thompson, Sample & Shrope, they have leaching works in full blast. They are now taking out some very fine ore and will soon ship a carload of 300 to 500-ounce ore. La Brosse & Co. have leased a portion of the Distaff mine from Chas. E. Sherman. This mine is famous for its rich ores, and La Brosse has struck one of the rich pockets. D. W. Grant is taking out rich ore from the Little Wonder mine. It takes him two or three months to get out a ton of ore, but when he gets it he has about \$700 or \$800. W. Brakeman has been shipping ore regularly from the Schenectady, and has been doing pretty well. Delhanty & Bissett are taking out some fine ore from the Justice. They have out now about five tons of 100-ounce ore. Then we leave Chloride and get to the Altata mine, owned by J. J. Goshorn. Here W. H. Kelly and Dan McKennon are working with Goshorn on a lease, and have out nearly two carloads of ore. They have to ship their ore to the Argo works, Denver, Col., as there is considerable copper in the ore, and the other smelters do not seem to want it, but so far, it has been the best paying mine in that section of the district. The new bonanza, the Minnesota mine, owned by John Barry, and leased to Hussy, Campbell & Madden, beats anything, so far, north of the Mineral Park. They can take out from two to three carloads a month of 150-ounce ore, with nothing to do but to stope it down and ship it.

MORENCI MATTERS.—Cor. Clifton Clarion, May 28: Notwithstanding the depreciation in copper, the production of the Detroit Copper Co. continues undiminished. It is true that the wages of the mine laborers are not quite as high as might be desired, but there is consolation in the fact that no reduction is contemplated. The principal mines worked at present by the Detroit company are the Copper Mountain, Yankee, Montezuma, Ryerson, and Arizona Central, the output of which, both in quality and quantity, continues as satisfactory as heretofore. Work at the smelters is running smoothly. One smelter is not sufficient to work off all the ore taken out, a second is therefore blown in a portion of the time. The production is about 400,000 pounds per month or 13,000 pounds per day.

TOMBSTONE.—Democrat, May 29: The Grand Dipper shaft is down 235 feet. Dripping has been discontinued at the first level, and no levels or cuts will be started until the shaft reaches a depth where connections can be made with the 300-level of the Grand Central. The Emerald will make its average shipment of about 500 tons of ore this month. The Silver Thread will, with one shift of a few men, ship about 75 tons of ore for May, averaging from 80 to 90 ounces per ton. The Maine's shipment for this month will be about 25 tons. The ore is of a high grade. At the Chance shaft is being sunk as rapidly as possible. The ore on the 75 level continues good. The shaft at the Jonathan has been straightened up and a small hoist will be erected without delay. Some little work is being done near the north line of the contact. No large deposit of ore has yet been found, but the ledge yields a fair quantity of average grade. The pump has arrived at the West Side. The chloriders at the Luck Sure, Ingersoll, and Mamie, are doing well. The usual work of development continues at the Rattlesnake. The drifts and stopes are looking well, and the ore taken from them to fill contracts is barely missed.

IDAHO.

CLEANUP.—Idaho World, May 27: Wm. Kearney and Thos. Barry, Jr., made a good cleanup last week in their claim on Yankee Bar, between Pine and Bannock creeks. This section was worked in early days down to what was supposed to be bedrock. Kearney & Barry conceived the idea that, as the ground that was worked was shallow, this was not the true bedrock, and proceeded to demonstrate their theory by sinking, and were soon through this strata and into good gravel. They proceeded to fit

up for hydraulicizing, and this spring have made a short but very successful run. Alex. Kyle is down from Elkhorn. He says this mine still makes an encouraging showing. Work in the lower level has been checked somewhat the past few weeks by a copious flow of water. About 100 tons of good ore have been taken out in the lower level. Alexander Kyle has been at work on his location near the Elkhorn, developing and prospecting. Jas. McMahon is digging a ditch to carry water on a location he made several months ago on a ledge two or three miles east of Elkhorn, on the east fork of Elk creek. More work is being carried on this spring on this side of the Basin, than last season, and the run this year will be unusually long, there still being a good depth of snow in the mountains. The present promises to be a good year all around, as additional activity is witnessed in quartz-mining and prospecting.

HUNTER.—Pioneer Press, May 28: Dennis Ryan, talking yesterday of his new mine in the Cœur d'Alene country—the Hunter—says that it is the richest in that range, but that operations on it have not commenced yet. The tunnel is 370 feet long already.

THE GUNN GROUP.—Wood River Times, May 27: The group consists of five mines. All show a defined vein carrying ore, but the developments have been mainly confined to the Jumbo, which is the central claim of the group, and upon which the mill is situated. The ledge shows up boldly all along the 1500 feet covered by the Jumbo location, and is exposed by numerous cuts, tunnels, shafts, or "prospect-holes." In one place the ledge is opened like a quarry, and four men can blast and extract 20 tons per day. The deepest workings are in the main tunnel, which is run so as to tap the vein at a depth of 200 feet. In these workings the vein shows to better advantage than anywhere else, as the ore assays from \$30 to \$150 per ton, and there is a compact body of it from five to eight feet wide. The Free vanners seem to be just what was needed at the mill to enable Capt. Gunn to get the full benefit of his ore. A few weeks ago he had Rouse concentrators, which had been placed with him on trial. They proved a total failure, as they utterly failed to save the sulphurets. The Free vanner started yesterday does this, however, the amount of loss not exceeding 10 per cent, and it is safe to say that from this time on, Capt. Gunn will realize fully \$200 upon every ton of ore run through his mill. The mill is of 10 stamps, and has a daily capacity of 20 tons. The Gunn group is owned by Capt. Gunn and Robert Rowland, of Camp creek, and Messrs. Wolcott & Mann, of Pocatello.

AT THE SMELTERS.—Ketchum Keystone, May 28: A new roaster is to be built and a smokestack 75 feet in height, capable of carrying off the smoke of six roasters, of the design of the one now to be built, will be erected. A carload of ore from the Idaho Democrat mine, near Hailey, was received during the week, coming through the Hailey sampling-mill. The mine is the property of Q. A. French. The erection of the new storage building will be commenced on the completion of the work now in progress on the water ditch of the company. The hauling of lime has been commenced by contractor Frank Gooding. The charcoal kilns have been charged and are ready for burning. Three carloads of fire-brick were received at the smelting works on Wednesday. A carload of ore from Flint district was received at the smelter on Thursday.

THE GOLD BELT MILLS.—Wood River Times, May 29: The Camas No. 2 mill is not showing very good results, as it has only two vanners for its 20 stamps. They, however, make a ton of concentrates per day, which assay from \$40 to \$350 per ton—besides what free gold is saved on the plates. Capt. Gunn's mill is running steadily and smoothly, but is still crushing the surface or low-grade ore. The two Free vanners make about one ton of concentrates per day, worth about \$100. Here, too, there is lack of tonnage in the vanners, as the two at work only take the slimes from about four out of the ten stamps of the mill. Three-fifths of the slimes, therefore, flow down the creek and are lost.

MONTANA.

ELKHORN DISTRICT.—Cor. Helena Independent, May 28: Elkhorn is in Jefferson county, 40 miles southeast from Helena. There is a fair chance of a mining boom this coming summer, in the camp. All the mines, with one or two exceptions, are showing up in fine style. In the Holter, owned by the Elkhorn Co., a rich streak of ore, averaging from 400 to 500 ounces, has been struck between the 650 and 750-foot levels. This mine has never looked so well before. During the past week a quantity of the tailings from the old fire-mill have been run through the roaster and pans. Much of these tailings run as high as \$100 per ton. In the C. and D. mine, owned by E. W. Toole, A. G. Clarke, Chas. A. Clarke, and R. T. Woolston, which is about one mile farther up the gulch above the Holter mine, it is estimated that there are 150,000 tons in sight, averaging about \$40 per ton; a great quantity of this ore is concentrating ore, which goes 13 ounces silver, \$16 gold and 15 per cent lead, and the probability is that a concentrator will be built this year to treat this ore. The 100-foot level has been extended 150 feet and shows up a body of ore 32 feet wide between the walls, the chief beauty of which is that it is all pay ore. The shaft is down 150 feet, and it is to be sunk still farther. There are over 1000 tons of ore on the dump. There is one stack smelter in connection with the mine, situated about two miles down the gulch. The present treating capacity is 30 tons per day, but another stack is in course of erection, which will increase the capacity to 60 tons. The Elkhorn Queen, a comparative recent discovery, is undoubtedly a very fine prospect. The ore averages 20 per cent lead, and carries a fair quantity of silver, from 30 to 300 ounces per ton. There are numerous rumors afloat about other rich discoveries, but many of the prospectors don't know the difference between crystallized limestone and crystallized lead, and their assays don't always pan out up to their expectations. Dr. Hogan, a young M. D., recently from Albany, N. Y., and Chas. F. Boyle, have leased the large body of mill-tailings which were corralled by Hollinbeck & Jamieson some five years ago, about half a mile below the mill, and are working them over with great success by means of a combination of the various Cornish processes, their concentrates running over 100 ounces per ton. There will soon be a

diamond drill in camp, which will be used for prospecting purposes. This will be a great advantage to investors in stock schemes, as for almost a nominal sum they can find out whether they are about to invest in a wild-cat or not. The promoter of the scheme is Chas. F. Boyle, of Helena.

NOTES.—Butte Miner, May 28: The Amy & Silversmith mine is working a force of 40 men developing on the 400 and 500 levels. The Champion is daily shipping its regular amount of ore to the Butte Reduction Works. The little hoist works to perfection. The Old Lexington is crushing 30 tons of ore a day of 24 hours. The Silver Bow mill gets away with only seven tons more. Miners will be put to work on Sunday in the Hope mine stoping. The shaft was sunk 20 feet the last week and favorable progress is being made. The new boilers at the Bluebird mill have been placed in position, and will be ready to steam up on the completion of the work on the stamps now being added. The chutes where the Bluebird cars are loaded for the mill could be greatly improved on, as at present they are very inconvenient when the brakeman starts his train. The crosscut on the 300 level at the Orphan Girl shows very good indications. The ledge has been penetrated five feet, and prospecting and developing are in active progress. Sufficient ore is being produced from the large ore body of the Josephine, just east of the Lexington, to keep the 11 stamps of the Old Lexington as well as those of the Margaret Ann mills continually dropping. Messrs. Murphy & Thompson, mineralogists of the Butte Reduction Works, have sampled some copper ore taken from different mines in Park canyon, and report that though some of the specimens are very fine, it is not present in sufficient quantities to pay for working. They intend making an extensive trip to out-of-the-way gulches and canyons, prospecting.

MISSSED THE SALE.—Inter-Mountain, May 29: Mr. R. B. Wallace returned to Butte last evening after a week's trip to Helena, Marysville and Bald Butte. The object of his visit was to make a mill test of the Sterling mines at Bald Butte. Some English capitalists had secured a bond on the mine, and the sale would have been made undoubtedly if it had not been for the passage of the alien law. Since that it has not been known exactly what would become of the deal, but the English parties desired Mr. Wallace to go over and make a mill test, which he has just done. Mr. Wallace took a look at the Drumlunnon, where 20 stamps are continually dropping. He says the mill comes the nearest to perfection of anything he has ever seen. The Gloster and Empire are running full, and the whole country over there is prosperous. Mr. Wallace thinks that the alien law will prove somewhat of a drawback to mining operations this year, and is of the opinion that a number of sales have been hindered by it.

NEW MEXICO.

SOCORRO NOTES.—Bullion, May 28: The ore receipts from the Magdalena district to this city are increasing steadily. Another and distinct ore body has been uncovered in the Three Lilies of Water Canyon. Work was resumed on the Anchor last week and is now progressing in a satisfactory manner. The Graphic is improving steadily and is shipping continuously to the Graphic smelter. The Black Hawk, Cowles and Mullen is showing up three feet in its 75-foot tunnel. The ore consists of lead carbonates bearing silver. The carment of ore from the Embolite mine at Hermosa, just treated at the Billing smelter, returned 145 ounces silver and four per cent lead to the ton. The Juanita is shipping to Socorro as usual. The shifts are to be reinforced immediately, as that property is showing up increased ore. Mr. R. M. White, superintendent of the Palomas Chief mine, gives us the figures of the returns from the carloads of ore recently treated at the Billing smelter: Dry weight of ore, pounds, 27,975; silver, ounces, 220; lead, per cent, 8.80. Messrs. G. L. Brooks and Charles Blanchard went out to Hansonburg. The latter gentleman says that the Compromise dump is a revelation of the treasures of that camp. The ore body and its silver value have increased steadily from the first day that Mr. F. Wilson commenced opening up the property.

FROM KELLY.—Cor. Socorro Bullion, May 28: Ed. Henson came up Saturday to begin work on the Tip Top, on which he will drive a 100-foot tunnel. Terry Mullen is putting in every hour on his property, and in a few weeks it and the Yellow Rose will be producing and paying properties. A large contract has been let on the Greyhound mine, also one on the Fashion mine.

OREGON.

GOLD HILL.—Rogue River Courier, May 29: The quartz mines of the Gold Hill Mining and Milling Company are a mile south of Gold Hill. They consist of three well-defined ledges, all of which have been sufficiently prospected by shafts and cuts to leave no doubt as to their extent and uniform paying qualities. On the North and South ledge three shafts have been sunk, and one drift 160 feet long has been run. In all the shafts rich rock was found. From the North and South we went to the 10-stamp mill, which we found in full blast. The mills are about half a mile from the East and West ledge, upon which they are now working. Two four-horse teams haul 36 tons of ore a day to the mill, which is worked through in 24 hours, and which yields \$5 per ton, the milling expenses being about \$4 per ton, as wood is convenient and cheap. We found the teamsters unloading what at first sight we called red dirt, and which was the so-called ore which was paying from \$100 to \$150 per day over and above running expenses. The Dardenlades ledge runs east and west, and was discovered by the blowing over of a tree which exposed the ledge to view, upon the dump of which we saw much red rock, the gold particles being plainly seen by the naked eye. From here we go to the East and West, where there are mountains of the above described carbonate ore. This mine is full of quartz seams and detached pieces of rich quartz which bears a large per cent of galena. We saw a 19-hour run on unselected ore clean up \$160. The bullion contains about \$15 per ton in silver. It is not found necessary to use the rock-breaker nor the concentrator upon the ores being milled. The Rogue river, which flows through Gold Hill, affords a magnificent water-power which, if utilized, would render the expense of milling these ores still less.

ORE CRUSHER.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gears, cogs or pulleys.

Power applied direct. Works Ore at Low Cost
 More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

SAW MILLS AND MACHINERY
Of all kinds made to order. Send for Descriptive Catalogue 17 and 19 Fremont St., San Francisco.

LOCOMOTIVE FOR SALE.

Gauge, 20 inches; height, 5 feet 6 inches; width, 4 feet; weight (fully watered and coaled), 8 tons. Also one extra set wheels, tools, 30-pound iron rails, etc.

Apply to
BALD MOUNTAIN MINING CO.,
Forest City, Sierra Co., Cal.
Or to 320 Sansome Street, San Francisco Room 24.

NOTICE.—My Silver-Plated Plates are well known and used everywhere. They have proved superior to all others in durability and weight of Silver.

GOLD MINERS

Working

Quartz, Gravel and Placer Mines!

—MY—

Silver-Plated AMALGAMATING PLATES

HAVE PROVED THE MOST ECONOMICAL AND SUCCESSFUL
PROCESS KNOWN FOR SAVING GOLD.

Over 3000 Orders Filled.

Fifteen Medals Awarded.

Old Mining Plates Bought, Replated, or Gold Separated.

These Plates can also be purchased of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine Street.

San Francisco Gold, Silver & Nickel Plating Works,

653 and 655 MISSION ST., SAN FRANCISCO, CAL.
E. G. DENNISTON, Proprietor.

SEND FOR CIRCULAR.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING MAY 24, 1887.

- 363,573.—PRESSER FOOT AND GUIDE.—J. F. Atterton, Portland, Ogn.
- 363,560.—VELOCIPED—E. Blossfeld, S. F.
- 363,365.—BALING PRESS—T. J. Corning, San Jose, Cal.
- 363,375.—WHIRLIGIG—J. Dupuy, S. F.
- 363,394.—SAFETY GUARD, ETC., FOR CABLE RAILROAD—W. Ireland, Sr., S. F.
- 363,467.—CIGAR BOX—D. H. Jaccard, S. F.
- 363,475.—LATHE ATTACHMENT—McCrosson & Hendry, S. F.
- 363,476.—LIFTING MACHINE—D. E. McKee, Potter Valley, Cal.
- 363,479.—HOSE REEL—Jos. Perkins, S. F.
- 363,686.—WHEEL CULTIVATOR—P. Scharbach, Silverton, Ogn.
- 363,489.—MUSIC LEAF TURNER—W. E. Swett, S. F.
- 363,562.—ELECTROLYTE—A. C. Tichenor, S. F.
- 363,491.—COMBINED BEVEL SQUARE, ETC.—E. F. Van Amringe, Oaklnd, Cal.
- 363,703.—FIRE-KINDLER—C. Van Gulpen, S. F.
- NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect accuracy, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MUSIC LEAF TURNER.—Wm. E. Swett, S. F. No. 363,489. Dated May 24, 1887. This music leaf turner consists in a combination of devices so as to provide a simple and effective implement for turning the leaves of printed music.

COMBINED TOOL.—R. F. Van Amringe, Oakland. No. 363,491. Dated May 24, 1887. This invention relates to the class of carpenters' combined tools, and especially certain improvements in and additions to that certain carpenters' level which is secured by patent to the same inventor. The invention consists in a combined level-square, beam-compass, level and gauge.

COMBINED BALING PRESS AND FEEDER.—L. G. Thompson and A. H. Isham, S. F., assignors to Truman, Isham & Hooker. No. 363,095. Dated May 17, 1887. This improvement in baling presses consists in a novel means for lifting the hay or material to be baled in regular or irregular quantities into the press, and partially compressing it before delivering it to the press; an improved mechanism for pressing the same in successive charges, and a means for loosening and discharging the bale after it has been finished.

LIFTING JACK.—A. K. Bagwell, Plainsburg, Merced Co. No. 363,194. Dated May 17, 1887. This carriage and lifting jack consists of a standard having guides in a vertical line at its upper end, in a movable lifting and bearing piece traveling in these guides, having offsets to support the load, and a curved lever fulcrumed in the standard, and having an anti-friction roller at the inner end which travels in a curved opening formed in the movable lifting piece, so as to raise and lock it when desired.

ELECTROLYTE.—A. C. Tichenor, S. F. No. 363,562. Dated May 24, 1887. This invention relates to an improved electrolyte, to be used in galvanic batteries for the production of an electric current therein. It consists of a solution in water of a certain earth which is found in various parts of California. The patent covers a galvanic cell or cells having electrodes, consisting of different metals in contact with an electrolyte or exciting fluid, composed of an earth whose component parts are silica, peroxide of iron, lime, alumina, magnesia, sulphuric acid and water, in certain proportions mixed with or dissolved in water.

HOSE REEL.—Joseph Perkins, S. F. No. 363,479. Dated May 24, 1887. This invention relates to certain improvement in reels for winding hose and in a means for supporting and driving the same. The object of the improvement is to mount the reel upon the truck which supports it so that when the truck is in position to be wheeled from place to place, the hearing-wheels of the truck serve to support the rims of the hose-reel, and cause it to rotate without the use of intermediate bearing of any kind, the rotation being at the same rate as that of the advance of this truck, whether the wheels of the latter be large or small.

LATHE ATTACHMENT.—J. T. McCrosson and Wm. Hendry, S. F. No. 363,475. Dated May 24, 1887. This invention relates to an attachment for turning lathes which is especially applicable for turning the tapering spindles of vehicle axles. It consists of a hollow or tubular sleeve extending outwardly from the face-plate or spindle of the lathe to which it is attached, and to a chuck supported at the outer end of the sleeve for holding the square portion of the axle and centering it by means of uni-

versal jaws while the outer end on the spindle is held by the tail-stop center of the lathe. In connection with this is an adjustable guide, which is connected with a tool rest so as to produce the desired taper to the spindle.

SAFETY SIGHT FEED REFLECTOR.—W. S. Getchell, Oakland. No. 363,060. Dated May 17, 1887. This invention relates to improvements in those devices which have what are known as "sight glasses," for the purpose of watching their operation; and the invention consists, in connection with the sight glass, of a guard or shield between the observer and the glass, and a reflecting surface or mirror on the other side of the glass, whereby, though said glass is concealed from direct vision, its operation may be as readily observed in the reflecting surface. The invention further consists in the particular and novel arrangement and combination of the said guard and mirror and their relation to the sight glass. The object of the invention is to protect the observer from injury due to the bursting of the sight glass.

LIFTING MACHINE.—David McKee, Potter Valley, Mendocino county, assignor one-half to H. P. McGee. No. 363,476. Dated May 24, 1887. This invention relates to that class of lifting machines in which the framework is a derrick-like structure, and the invention consists in a fixed mast, a boom hinged thereto, and adapted to move through an arc in a vertical plane, said boom being jointed, so that it can also move through an arc in a horizontal plane, a block and tackle and a winch for operating said boom, an adjustable extension for the boom, peculiarly operating and constructed, a lifting finger upon the end of the boom for its extension, and details of construction relating to the several adjustments and operations of the machine. The object of the invention is to provide a simple and effective machine for raising weights of any description, either merchandise, sacks of grain, hay or anything else required to be elevated, said machine being of a character easily transported and readily set up in a desired position.

Mining Share Market.

Those interested in the stock market seem to be expecting a much better market than they now have. The *Enterprise* says there are some rumors of improvements in the Consolidated California and Virginia at one or two points, but nothing has been officially made known of any new ore strike in that mine.

The grading for the new water-mill below the Chollar shaft is about completed. All will be finished as regards grading in another day or two. Already the stone masons have commenced operations and are engaged in laying up a wall on the south side of the excavated site. This wall is three feet in thickness and is being constructed of the finest of porphyry rock. Mr. Nolan, the contractor for this part of the work, has a strong force of stone masons on the ground, also has many men employed in his quarry.

Many carpenters are at work at framing and preparing timbers for the mill building. The battery-blocks have already been completed, and yesterday they were at work upon the heavy timbers that will be used in the construction of the battery-frames.

Many men are now employed about the California stamp-mill, which is to be run by water-power, as also will the pan-mill that is to be operated in conjunction with it. Both mills will be driven by power transmitted from the C. and C. shaft, in which will be placed the big Pelton water-wheels, referred to in another column. The power will be transmitted by means of steel-wire cables or belts.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court Department No. 1, San Francisco:

TEALS MARSH BORAX CO. May 31. Capital stock, \$1,000,000. Directors, F. M. Smith, Warren Olney, J. W. Mather, Alton H. Clough, and J. H. Maynard.

PIONEER LAND CO. May 31. Capital stock, \$3,000,000. Directors, S. T. Alexander, W. H. Chickering, P. N. Lilienthal, W. Thomas, and Leon Sloss.

SONOMA LAND AND IMPROVEMENT CO. May 31. Capital stock, \$750,000. Directors, A. S. Rhorer, N. W. Griswold, M. Rhorer, A. G. Pratt, and C. W. Crocker.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Alice, May 28, \$34,428; Moulton, 28, \$12,528; First National, 28, \$50,241; Bluebird, 28, \$15,068; Alice, 29, \$33,712; Hanauer, 25, \$45,000; Alice, 25, \$14,269; Bannock, 20, \$11,000; Hanauer, 24, \$71,700; Con. California and Virginia, 31, \$71,235; total for May account to date, \$223,968. The first shipment of bullion from the Sprucemont (Elko county) furnaces was made last week. There were 700 bars, weighing 35 tons, value not stated.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

MINING SHAREHOLDERS' DIRECTORY.

New York Metal Market.

Telegraphic advices dated June 2d give the following

New York prices:

BAR SILVER—95c per oz.

BORAX—61@67c.

COPPER—LARS—\$10.40.

IRON—No. 1, \$22.00.

LEAD—\$4.30@4.36.

QUICKSILVER—\$30.65c.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Steady. Spot closing at \$9.90@9.95. Transferable Notices (Lake) issued at \$9.95@—, Transferable Notices (Chili Bars) issued at \$9.35.

LEAD—Firm at \$4.66@4.70 spot. Transferable No. 1 notices issued at \$4.57.

TIN—Quiet at \$23.00@23.05. Transferable, notices issued at \$23.80.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, \$22.00@23.25; Billion Tin, \$23.60@23.60; Banca Tin, \$23.00@24.00; Baltimore Copper, \$9.06@9.25; Orford Copper, \$9.00@9.26; P. S. C. Copper, \$10.00@10.26; Foreign Lead, \$1.65@4.70; Foreign Spelter, \$4.70@4.76; Antimony, \$7.66@7.70.

MARKETS PRICES—At tidewater. 100-ton lots of listed lumps (when brass is specified) range normally about as follows: Beach, Grade No. 1, \$20.50@21.00; No. 2, \$19.60@21.00; Grey Forge, \$17.60@19.00; Hudson River, Grade No. 1, \$20.60@21.50; No. 2, \$20.00@21.00; Grey Forge, \$17.50@19.00; Southern, Grade No. 1, \$21.60@22.00; No. 2, \$21.00@—; Grey Forge, —@—.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not subscribe to notify us to discontinue it, or some irremediable party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

SEVERAL HUNDRED TONS of nitrate of soda were burned at the Giant Powder Works on Saturday last. Burning shingles from the fire were carried by the wind to the Jackson Powder Works, near by, and a pile of unrefined sulphur also caught fire. The high explosives in the adjoining buildings and the office furniture and other portable property were at once removed to a place of safety. The total loss from the fire will amount to not quite \$4000.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Prices List.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Golden State and Miners' Iron Works.
Sole Manufacturers,
287 First Street. San Francisco, Cal.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"CHALLENGE" IMPROVED ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
J. R. TREGLOAN, Supt. South Spring Gold Mining Co., Amador City, Cal.

And many others, and we are prepared to furnish either the

"CHALLENGE," "STANFORD," "TULLOCK," or "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and copies of Testimonial Letters, and will quote prices upon application.

\$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), London, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

THE FRUE ORE CONCENTRATOR OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co., Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, hearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringing upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

IMPROVED HYDRAULIC MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

The Bryan Roller Quartz-Mill.

The Bryan roller quartz-mill, manufactured by the Risdon Iron Works in this city, has recently been doing some very good work in ore-milling. The mill is very simple in construction, as the engraving shows. It requires no framework, but is built ready for its foundation.

A glance at the engraving will show the plan and construction. It consists of three steel-tired rollers, which run over steel dies in an annular mortar. An iron tank or drum, around which the actuating belt passes, bears on the face of the rollers and increases their crushing force. These rollers are 30 inches in diameter and six inches thick, and each weighs 1200 pounds. Each steel roller is provided with a tire $2\frac{1}{2}$ inches thick, and is of uniform size, so that it can be removed and replaced with facility. One set of tires will crush fully 1600 tons before renewal.

The axles are fixed solid in rollers and are journaled on an annular plate, which rotates loosely around the solid center post, and all the bearings are thoroughly lubricated by oil channels, so arranged as to absolutely prevent the oil from entering the mortar. The solid center post is stepped in the mortar and is supported firmly by suitable devices; it enters the bearing plate of the drum, which, with the rollers, rotates round the post as a common center.

A very important feature of this roller-mill is the device for keeping the rollers clean from pulp. It consists of an adjustable spring and scraper (shown in the engraving), which follows each roller in its rotation. The spring is set to the die and its tension is readily adjusted. The direct purpose of the scraper is to keep the face of the die, and the roller also, clean from pulp, which otherwise would collect and adhere to the roller and reduce its crushing force. The scrapers serve also to discharge the pulp, and to distribute and equalize on the dies the ore received from the feeder.

The mortar is provided with three openings for the screens, which are four feet long by five inches wide, and usually No. 40, giving ample surface for discharge. The chute for carrying off the pulp extends round the mortar to the spout over the apron.

In the operation of the mill the pulp runs around the mortar; next to the screens, in a rapid current of not less than 300 feet per minute; but toward the center, inside of the rollers, the movement of the pulp is much slower, and as the gold is liberated from the matrix it falls to the eddy side of the current, and in practice is found amalgamated in mass around the cone in the center of the mortar. By this action the free gold is not subjected to the continuous grinding of the rollers in the mass of pulp, and nearly all the gold contained in the ore, fully 90 per cent, is retained in the mortar. It is stated that the ore does not slime, and the sand and pyrites are left of uniform size and in the best condition for concentrating. The "clean-up" of the mill, owing to its simple arrangement, is done with ease.

The movement of the mill is at the rate of about 50 revolutions per minute, and it is almost noiseless. It requires less than five-horse power to run it, and will crush about 14 tons in a day with No. 40 screens. The capacity of the mill can be varied by weight in the tank pulley, which rests on top of the rollers. The

mill is made of the best quality of iron and specially selected steel, and is thoroughly finished in all its parts. The mortar, with the obute and spout, is generally cast in one solid piece, but for transportation by packing in the mountains, the mortar is specially cast in sections weighing 300 pounds. The whole weight of the mill is about $5\frac{1}{2}$ tons. The cost is \$1500 complete with aprons, silver plates, etc. Challenge ore-feeders are used, but are not furnished with the mill.

This roller-mill is adapted for any gold mine, large or small. A party of miners, having little means and owning a small gold mine, can get the gold from their ore and "pay as they go." One is now at work on the Little Amador mine, Amador City. Another was recently shipped to Savannah county, Virginia, for a

Gold in India.

For more than 2000 years the inhabitants of the civilized world have obtained most of their costly silks, rich spices and some other articles of luxury from that portion of India now ruled by the British. In payment of these commodities, gold only was at first received, except in so far as the English have been able to substitute certain of their manufactured goods for the precious metal. How much gold, first and last, has for such purpose gone into that country is, of course, unknown, though its value must run up into the billions. It is by some writers on the subject calculated that more than a billion has been "hoarded," with nearly as much more manufactured into articles of ornamentation or use. Of this gold, none has

Where They Are.

It has long been matter of observation that but few quartz veins have ever been found in the immediate vicinity of our leading drift mines. This class of deposits, so far as surface exposure is concerned, is noticeably absent in and along Slate Creek basin and about Bald Mountain, Sierra county; around You-Bet, Red Dog and Liberty Hill, Nevada county, and along the Forrest Hill divide, Placer county, all prominent drift-mining localities. The deep placers at these several points having been extremely rich, it has, by some of our thoughtful students of the geology of this region, been surmised that the quartz lodes were not here wholly wanting, only that they failed to come to the surface—in other words, they exist, but are deeply buried under the diluvial drift that once covered to great depth this portion of the foothill country.

This theory seems very reasonable, since it is hardly to be supposed that the quartz belt, elsewhere so conspicuous along this range, should have been intermitted at these, the richest points in placer deposits along its whole course. Nor have they been, as recent developments tend to show. During the past year large and valuable quartz veins have been uncovered in several of the drift mines on the Forrest Hill divide, though there are no surface indications of quartz in the vicinity. Preparations are being made to work some of these deposits, which, of course, can be done at little expense, tunnels having already been driven to them.

It will not be strange if quartz veins should be struck in other of our drift mines. They, no doubt, extend continuously along the main gold belt, and if not everywhere encountered in drifting, it will be because the work of exploitation has not been carried sufficiently far down or may not be prosecuted at the exact point where they happen to exist.

The uncovering of quartz deposits in the hydraulic washings has in this State been of frequent occurrence. What is considered an important development of this kind took place not long ago on Scott river, Siskiyou county, the vein here exposed being a very powerful one, and portions of it rich in free gold. A mill is about to be put up for crushing this ore, some of which has already been worked with excellent results. Since the bars along Scott river were exhausted, the channel of that stream has been the theater of the most extensive river-bed operations ever carried on either here or elsewhere. Wherever worked, the bars as well as the bed of that river have yielded largely, and, although the gold that enriched both came originally from the quartz veins in the vicinage, few of these show more than the faintest outcrop, some, like the one above mentioned, no outcrop at all. What new source of California's hidden wealth shall next be revealed we wait to record.

THE ACADEMY OF SCIENCES at its last meeting adopted a resolution to hold a special executive session to consider the propriety of borrowing money from the Lick Trust with which to put up a new building on Market street.

THE receipts of coal at this port in May were 79,100 tons, making a total since January 1st of 420,000 tons, against 290,300 tons during the same time last year. The receipts this year are heavy.

THE BRYAN ROLLER QUARTZ MILL.

gold mine there. Two are in use at a mine in Durango, Mexico, where they have been giving satisfaction for some considerable time.

PIONEER MINERS.—The Pioneer Miners' Association met this week to act upon the report of the committee appointed to draft a constitution and by-laws, President Rutherford, of Oakland, occupying the chair. The report which was adopted makes an important change in the qualifications of the persons eligible for membership. It was originally provided that only those who had been residents of a mining district prior to 1857 should be eligible. A communication from the secretary of the National Association of Pioneers stated that all persons who were residents of the State prior to 1860 were eligible, and it was decided to make that year the limit in the Pioneer Miners' Association. The initiation fee was fixed at \$3 and the yearly dues at \$2.50. The directors will meet and fix the date of the annual meeting of the association, which, it is generally understood, will be made to fall on the date of Marshall's discovery of gold. This will not apply to the present year, as the first annual meeting has already been set for July 7th, the date of the raising of the first American flag at Monterey.

been coined; as a circulating medium, the whole has, therefore, been lost to the world.

It is now suggested that the mint at Madras and Calcutta be opened to the coinage of this metal into English sovereigns, whereby it is thought much of it could be made available for monetary purposes.

That such will be the result is, however, more than problematical. The natives of that country disposed of their gold in the manner mentioned as a means of saving it, knowing that if converted into coin it would soon slip from their possession. When shaped into jewelry, utensils, trinkets, etc., not being exchangeable for other things, they had no alternative but to keep it and thus he always endowed with a certain amount of intrinsic wealth, which could be easily concealed from their rapacious oppressors and at the same time be made available in an emergency. These ideas, no doubt, still obtain among these native races. In India, silver is and always has been a legal tender to any amount, at the option of the payor. This metal, with the inhabitants of that country as with most Oriental peoples, has always been the favorite coin, as it probably will continue to be, continuing India the great silver absorber of the world.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Southern California.

[No. 3.—CONTINUED.]

[Editorial Correspondence.]

The City of San Bernardino.

Coming back to the city, we find a thriving, beautiful town, containing a population of from 6000 to 7000 souls—nearly double that of one year ago. This city, as incorporated, is laid out just one mile square. This center of the main street constitutes a portion of the east and west base line from which all the Government surveys in the southern part of the State start north or south. This is known as the Mount San Bernardino base line. This city presents a bustling scene of activity; it is being well and substantially built, and is ornamented with a great number of fine public buildings and elegant private residences, with roomy grounds elegantly laid out and beautified with trees, plants and lawns; while from every direction the eye and senses are delighted with the beauty and fragrance of the orange, the lemon and every variety and color of shrub and flower. As already remarked, the climate of San Bernardino is delightful. The summer tradewinds from the ocean, as they reach this city after a passage through the San Gabriel valley, are mild and invigorating. The thermometer sometimes reaches 100° or 110°, but even at the latter point the air is not as oppressive as in San Francisco at 90°. This fact is due mainly to the cool air which comes down from the mountains during the night, cooling and gently modifying all the surrounding country from the noontime heat of the previous day.

San Bernardino County

Is the largest in the Union. It is a dominion in itself, exceeding in extent of area several important kingdoms and republics of Europe. It is double the size of the State of Massachusetts. It is one of the oldest American settled portions of California. True, much of the larger portion of its area is mountainous and comparatively barren; but it nevertheless contains within its borders, some of the finest lands on the Pacific Coast, and there are none which excel it in the production of tropical fruits. There is scarcely a product of earth, mineral or vegetable, that cannot be produced in some portion of San Bernardino county. Even its most rugged mountains are not devoid of value, as they contain some of the richest mines in the State, and afford opportunities to gather up from their snow-capped summits winter water, which may be held and distributed as it is wanted during the drouths of summer. An important enterprise in this direction is just now being started by Maj. Bonebrake, who owns some 50,000 acres of land on the great plains north and west of San Bernardino. The winter waters of Lytle creek are to be utilized and stored up much after the manner of the Bear valley enterprise, which will furnish water sufficient to irrigate from 15,000 to 20,000 acres of the land above referred to.

Colton,

Situated directly upon the Southern Pacific railroad, four miles from San Bernardino, is rapidly assuming considerable importance as a business center and shipping point. Fourteen years ago the ground upon which the town stands was a worthless waste. Now it is an important railroad center, with a population of about 2000 souls, with a bank, cannery, fine stores, hotels, and a constantly increasing line of general business. The Southern Pacific and Atchison, Topeka & Santa Fe lines cross each other at Colton. It is connected with San Bernardino by a motor road, and another similar road will be built this summer to connect Colton with Redlands and Lugonia. The latter will be a broad gauge and fitted for both freight and passenger traffic. It is a terminal point of traffic on the Southern Pacific. The town is growing rapidly and increasing in wealth and importance. A fine hotel has been projected to be built upon Silver mountain, a short distance from the town. It will be built under the patronage of the Southern Pacific railroad, and will rival in magnificence and outlook the famous Raymond at Pasadena.

RIVERSIDE.

The fairs of Riverside has become world-wide. It is a city of gardens—the whole a beautiful park. It is made up of beautifully embowered homes—of elegant villas surrounded by groves of orange and lemon trees. The scenery of Riverside is superb. Flowing streams and delightful homes with fruit, foliage, plants and flowers in endless variety, comprise the foreground; while abrupt but shapely hills, backed by lofty mountains, fill the distant perspective. The climate is delightful—there is no winter, while the heat of summer is so tempered as not to be oppressive. It is indeed

"A Paradise to mortals given,
To make us think the more of heaven,
To make us prize the blessings given,
Where hills and mountains e'en surround,
Lulled by the winds to calm profound."

It is one of the most prosperous and beautiful settlements in Southern California. Fifteen years ago it was nothing but a barren desert,

dry, uninviting and of little value. Now it is a prosperous city of some 5000 or 6000 inhabitants, with fully 6000 acres covered with grapes, oranges and lemons, all under a state of cultivation nowhere excelled on earth. Magnolia avenue, the most beautiful drive in California, extends for some eight miles directly through the center of the city, bounded on either side by rows of palm, cypress, paper and eucalyptus trees, with hedges half concealing yet ever revealing continuous orchards and groves of orange, lemon, lime, olive, apricot, etc., interspersed with vines. Riverside is the center of citrus fruit culture in California. Not only does it excel any other locality, either in California or Florida, in the extent of its orange groves and the amount of fruit produced, but it is the most free from insect pests, and its fruit commands the highest price in the markets.

As a Raisin-Producing District,

It is equally well known. Its raisin product for the last six years has been as follows, expressed in boxes: 1880, 20,000; 1881, 40,000; 1882, 50,000; 1883, 70,000; 1884, 85,000; 1885, 110,000. The reader will notice the gradual annual increase of production. The amount of the product for 1886 is not before us as we write, but the total receipts therefore were something over \$200,000. Five hundred carloads of green and dried fruit were shipped from Riverside last season.

Old Riverside.

Those who were present at the late Fruit-Growers' Convention, held in Riverside, cannot fail to recollect the graphic description of the country in and about Riverside as given by the venerable General Vallejo as he saw it before any attempts had been made to introduce American improvements. It was then a pathless desert—beautiful and green in springtime, but dry, dusty and sun scorched the balance of the year. In time came the American sheepherder, who pastured his flocks upon those broad plains, then uninviting and apparently valueless to any other use. Gradually this sheepherder passed away and men with brains and energy came upon the scene. The soil was evidently rich and inviting, as was proven by the appearance of the old San Bernardino Mission and the new San Bernardino town which was springing up near by—each in districts well watered by artificial means. Hence there was no reason why other settlements might not be made with equally successful results. To this enterprising man from the East, a practical conception is quite generally carried out to its legitimate results, and no sooner was this idea conceived than capital was raised, engineers engaged and extensive works set on foot to bring in water from the adjoining Santa Ana river for irrigating purposes.

Mecical Changes

Were soon wrought out. Chaired by the refreshing water, tickled by the plow and harrow, and urged and encouraged by the persuasive energy of the enterprising and intelligent cultivator, the once dry land soon began to bloom with every variety of blossom for fruit and flower, and we now behold thousands of acres of vineyard and orange and lemon groves, with miles upon miles of green and shaded avenues, dotted all along with cottages and villas, denoting the presence of happy and prosperous homes. Land that but a few years ago was not worth the care of occupancy is now readily selling with its improvements at from \$400 to \$2000 per acre. Business lots, in the center of the town, that two or three years ago were selling at from \$1000 to \$10,000 each, are now bringing from \$10,000 to \$15,000.

Homes and Investments.

From what has been said it will be readily seen that Southern California, and especially the upper portion of the San Gabriel valley and the San Bernardino valley as well, present most favorable advantages to the seekers for homes, where a few thousand dollars of ready money are at command for the establishment of a country home, which may also be made a source of permanent and annually increasing income. The well-known climatic advantages of Southern California first induced settlers to go there in search of health. Many of these people had before made annual visits to Florida, on the same errand; but on once trying California they found the conditions so much more favorable that they have ever since continued to "go West" instead of "South." These advantages are now so well known to this great crowd of health seekers that the main tide of summer travel is turned in this direction, and while the hotels of Florida are nearly empty, it is almost impossible to increase the hotel accommodations of California fast enough to meet the vast demand. No invalid now thinks of going to Florida for a permanent home. The summer climate is baneful rather than otherwise; while California offers the highest climatic advantages to the invalid seeking a permanent home for himself and family, where he may not only enjoy all the health advantages, but where numerous opportunities are also presented for profitable investments on either a large or small scale.

Will this Boom Continue?

Most assuredly it will. So long as the same unpleasant climatic conditions exist east of the Rocky mountains, and so long as the mild climate of California continues to invite health-seekers, just so long will the present movement—or boom, as it is sometimes called—continue, at least until the country is literally filled with new-comers. There will always be a great army of persons at the East broken down in health by

the rigors of the climate—persons who have made money and are well-to-do, and who are desirous and abundantly able to better their conditions, who will turn their faces to these Western shores. This army is being more and more largely recruited every year. No human agency can change the climatic conditions at the East, and no human power can prevent the suffering ones from seeking relief in the mild perennial spring and summer of Southern California. There will be enough of them who will come every year—many thousands who will come to stay. This is quite unlike the ordinary tides of human movement, which are usually set up by accidental circumstances, in which the moving cause soon disappears. In this case the cause is as immovable as the laws of nature, and nature alone has power to stop the movement. When the conditions are exhausted; when there is no more land that the wealthy invalid can buy, even at high fancy prices, then we may look for a cessation of the present influx into California—and not till then.

The Great Rush of '49 and '50

Is being repeated. The chief point just now is Southern California; it is already spreading north. The lower San Joaquin is beginning to feel the overflow from Los Angeles. This movement will undoubtedly be continued until the population of every portion of the State, from Oregon to Mexico, has been largely increased. Every part of California possesses climatic and other advantages for homes and business far superior to what can be generally realized in any of the States east of the Rocky mountains. The boom of the early years of California was initiated and kept up by the richness and abundance of her mines. When they began to be measurably worked out the boom as a matter of course died out. The climate and wonderfully productive nature of our soil, both of which are new discoveries to the majority of our Eastern friends, are the moving agents in the present boom. Neither climate nor soil will decrease in value or desirability, hence there will be no material diminution in the movement in this direction until the State is fairly filled up with people—not until they can be numbered by millions. W. B. E.

The Cœur d'Alene Mines.

[From our Correspondent, R. G. HUSTON.]

This much-abused section of country is now fast making its way in the world. The last town of prominence is already in direct communication with the outside world by rail and steamboat. Leaving the N. P. at Hauser Junction, we go by rail to Cœur d'Alene City and Fort Sherman. They lie side by side on the shore of the lake, a most picturesque spot, and one that should attract the attention of tourists from the East and West as they are crossing the continent. It is a lovely spot to rest a few days to fish and hunt. From here it is 60 miles across the lake and up the river to the Mission. The town of Wardner is the outgrowth of the discovery of the Sullivan and Bunker Hill

Mines on Milo Creek.

These properties showed up such immense bodies of ore at the surface, that a contract was let for the concentrating of 50,000 tons. From that time the growth of the camp has been as phenomenal as the old-time placer-mining camps.

Portland capital having been on the lookout for some time for outside investments, has been the first to get into this new section. In the immediate vicinity of Wardner, they have succeeded in purchasing nearly all the properties that have made any development. They have the Sierra Nevada; this is probably the richest ore in the camp, as wire silver is frequently come in contact with in mining their ore. Then they have the Tyler, Semwinder, and now the Sullivan and Bunker Hill group have been acquired at an expense of about \$1,000,000. All of these properties carry galena and silver in paying quantities.

It is only a fair business proposition when so much capital has been invested that improvements will be made, plants put in, and a large amount of money disbursed. This will be of great benefit to the many prospectors in this country, as it will give them funds to procure the necessary "grub stake" to continue prospecting.

Leaving Wardner and

Following up the South Fork,

We soon come to the Goldsmith. This is a gold-bearing ledge and was sold to some Louisville parties some time ago. It is their intention to place a plant on their property this coming season. From here on, up the South fork to Nigger Prairie, there are many discoveries and locations, but comparatively little development, except on Canyon creek and at Mullan. The Tiger mine, on Canyon creek, is about as thoroughly a prospected mine as there is in the section. Here a number of tunnels have been run on this vein at different levels, and in the lower level a shaft has been sunk over 100 feet in depth, thus developing this continuity of the vein and proving it to be a mine in reality. The ore carries a large percentage of lead and a sufficient amount of silver to make it a fine-paying investment for capital to place a first-class plant on for the reduction of the ore. This, with the fact that ere another winter arrives, a railroad will be running to the

junction of Canyon creek and the main South Fork, and that they will be able to ship their ore at a profit, makes the outlook a flattering one. The present owners are undoubtedly men of means, or they could not have done the amount of development work. Messrs. Glidden and Burks have, I think, one of the star properties of the Cœur d'Alene mines.

Many extensions have been located here, and more or less work is being done, according to the inclination and wealth of the owner. The Hidden Treasure, the first extension west, is under a bond of \$15,000 to Messrs. Armstrong & Co., but on account of the very deep fall of snow this winter, they have thus far not been able to do much in the way of development work.

Diamond Hitch

Is one of the oldest locations next to the Tiger in this district. It is owned by Reeves & Kaiser, and they have a level run for some distance, and a shaft from the end of this level, sunk to a depth of 100 feet. In this shaft they have some very fine ore of different characters, in which silver is found. It is native silver in slabs. They also get some sand carbinates that are very rich. This property is for sale, as the parties are unable to properly develop it themselves, and have other prospects in the vicinity. They wish to dispose of one to provide themselves with means for the development of the others.

A number of fine prospects have been located and quite a large amount of work has been done on Nine-Mile creek, another tributary of South Fork, putting into it at Wallace, a short distance below where Canyon creek enters in. Two of the best ones are named respectively California and San Francisco. These properties carry a high percentage of lead and silver, and thus far their owners are satisfied with the outlook.

Mullan.

This town is nine miles further up South Fork and has already some very fine prospects, one of which, the Hunter, was sold a short time since to a representative of Dennis Ryan, of St. Paul, for \$80,000. They are now working a force of 18 men on this property and making a good showing. This is in the Nigger Prairie district. There are many other flattering prospects here. Among them is the Central, owned by W. G. Stagner & Co., who have a tunnel in 100 feet, and crosscutting the vein and showing a width of 20 feet. Much of this is solid galena running from 30 to 40 per cent lead and carrying lots of silver.

They have very high expectations of having railroad communication here by having the railroad from Wallace extended up the South Fork to this point. There is no doubt of the feasibility if the enterprise of the country shows up well enough to justify it.

The present objective point of the railroad is Wallace. This is a town in embryo at the junction of Nine-Mile creek with the main river. The location is quite central, and should the railroad people conclude to make this the terminus, will, no doubt, make quite a town, as it will be the nearest point for shipping for Delta, Myrtle, and Murray. As a matter of fact discoveries have been made and located all along from Wardner to Mullan and the owners are millionaires in prospect, the usual feeling for prospect-owners. These will come to a common center at Wallace. As the season advances many of these prospects will be energetically developed.

The county road leading from South Fork over to Murray, via Beaver creek and Trail gulch, is a very good one, and must have cost the county a round sum, as it is a heavy grade for about seven miles over a high divide.

Poney Gulch.

A tributary of Beaver creek, was this point of attraction about the time I passed through here. Capt. Herman & Co., who have been running a tunnel on the Fay Templeton lead, a free-gold prospect, had been having a fine showing of ore and were refusing an offer of \$100,000 for the property at that time.

This was sufficient to cause other property in the vicinity to rapidly appreciate, and an owner of one-sixth interest in the Mammoth, an extension of this same lead, sold for \$2000. The new town of Templeton was laid out and lots were being rapidly recorded. Real estate was booming, so to speak. Delta is at the junction of Trail gulch with Beaver creek, and has been built and kept up so far by the placer mines in Trail. The miners were just getting to work in good shape when I was there, and will no doubt have a good season of water this year.

John Harman is getting ready to operate his hydraulic elevator, having put in quite an extensive plant of pipe and ditch, and is this year expecting to realize on some of his investments.

I here met some of my old placer-mining acquaintances of many years ago—the Hauck Bros. They had run a long headrock drain to some ground in Trail gulch with rather indifferent success, but they are just now turning their attention to quartz and may soon be repaid for all their hard labor and investments in the placers of Trail.

Further up the gulch several other companies are operating with more or less success, but most of them are well pleased with their success. Among these are Frank Gordon, W. J. Nickerson, Chas. Fulton, and a number of others who have the good taste to be subscribers to the PRESS.

P. H. Mahoney, on Placer gulch, is working a few men with fair returns, and is comfortably

situated to stay with the country until he gets his claim worked out.

From here over to Murray is three miles, by what is called the Sky trail, and that is the way I went. I will frankly admit that I think the trail well named.

(To be Continued)

A Ventura County Bee-Ranch.

EDITORS PRESS:—On the western banks of the Saope river, near the mouth of the mountain canyon of that stream, about three miles northeast of the Saope depot of the coast extension of the S. P. R. R., is located the very fine apiary of R. Wilkin. We refer to the accompanying illustration as an accurate representation of the same. Mr. W. is an old Californian and apiarist, well informed in the science of bee-keeping, and considered first-class authority. We write these notes partly from personal inspection of the premises, and partly from information kindly furnished us by Mr. W. while at his apiary a few days ago.

Mr. Wilkin located here to be out of the way of other bee men, if that were possible. His has at this place 450 colonies. His hives are the simplest form of the Langstroth. The brood-chamber contains about 1900 inches. The upper story is the same as the lower, and the two are interchangeable. The covers and the bottoms are the same, two inches longer than the hive, so that when at the bottom, the extra in length projecting furnishes a good lighting place for bees. The ends of these hives are furnished with cleats, rabbeted down so as to nail from top and end. When the covers become old, or in the least leaky, they may be changed to the bottom.

Foundation comb is used so as to exclude drone comb as much as possible. It is thought drones will, in any event, be numerous enough for all practical purposes. Mr. W. makes his own foundation comb, by means of well perfected machinery.

The extracting house stands in the center of the apiary. This is for convenience of access, the rows of hives diverging from it in every direction. The house is a small frame, say 10 by 12 feet. In order to exclude bees, the door is so arranged that, upon passing, it always shuts to of itself, by assistance of a clock-spring. The frame of upper half of the walls, all around, is covered with wire cloth, which furnishes ample ventilation, making a very pleasant place for work, and a comfortably cool retreat during warmest weather. Grapevines, hanging in festoons around the eaves, during the fruiting season, present a most delightful picture.

The capping-box is 6 feet long, 2 feet deep, lined with tin. It has a false bottom of galvanized iron perforated, to drain the honey from the cappings.

The extracting tank is one of Mr. W.'s own getting up, is square, comes up against the end of capping-box so that the honey is easily drained from the capping-box through an opening leading into the tank. In capping, the honey-frame is rested upon an iron pivot, which makes it very easy turning from side to side.

An eight-framed comb revolving extractor is used. The honey flows from the extractor through a pipe to a

System of Evaporators.

These are four in number. Each is 12 feet long, 5 feet wide and 1 foot deep, holding about 5000 pounds honey; made of tin, and painted on the outside to prevent rust. A light wooden frame around the top of each evaporator helps to stiffen the sides and hold in place. Upon this rests a covering of muslin arched, which admits the heat of the sun, and yet serves to keep out insects, dust, etc. The muslin is supported by six cross-sticks elevated in the center and fastened at ends on to the wooden frame above sides of the evaporator.

It is necessary that the system occupy slanting ground, so that the honey may flow from the bottom of the evaporator next the extracting tank and in at the top of the next in order, and so on down through the series. From the lowest evaporator the honey flows into a 14,000-pound tank of galvanized iron. This may be of other material, such as wood lined with tin, etc. From this the honey is drawn into tin cans for shipment.

In the process of evaporation, any watery substance that may be mixed with the honey is removed, and the honey becomes thick and rosy. This seems to prevent, to a considerable extent, the tendency to granulation. Mr. W. has about five tons stored away in tin cans which was thus treated before canning, and which is now apparently as liquid as when first evaporated a year ago.

When first-class honey begins to flow, it is important to throw out all dark or second-rate honey so as to have the qualities distinct. This work should be done early in the season, so as to be ready for the new flow, as it is important to get the best honey on to the market early.

In case of an emergency in any season, these evaporators may be used for storing honey. They with the large tank have a combined capacity of

about 34,000 pounds. One of these evaporators turned over for a roof, temporarily boarded up at sides, furnishes a good winter store for the cans of honey remaining on hand.

Mr. W. has been shipping to England. He has, within the past four or five years, shipped to one firm there, in one and two-pound cans, sufficient to realize from the sale about \$40,000.

Heretofore, perhaps, at least nine-tenths of the honey of this county has been extracted, but there is now a tendency to give more attention to comb honey.

Until within the three years last past, foul brood existed in the county to a considerable extent, but since that time a County Foul Brood Inspector, appointed under a recent law, has condemned, and destroyed by burning, about 300 hives of bees. By this means the disease is now being kept in check, while it is reported that in some of the neighboring counties its ravages are considerable.

It is thought that within a radius of two miles from this apiary, there are now about 1800 colonies of bees belonging to various persons, and generally doing well. This shows the great abundance of bee forage in the county. This apiary last year produced 130 pounds of honey per hive, average. They

BEE RANCH OF R. WILKIN, VENTURA CO., CAL.

would, of course, still do better if there were fewer in apiary or neighborhood. This year it is not expected they will do so well, as the flowers, although blooming profusely everywhere, yet seem to be wanting in abundance of honey-yielding properties.

The leading honey-producing plants in this neighborhood are alfalfa, phacelia and wild mustard, which bloom early and give a start in the spring and during the breeding season. Then comes purple sage, then white sage and "wild alfalfa"—this last a plant of the broom family. These yield the main portion of the choice marketable honey sent away from here every season. The Tigon or bearberry and Sumac produce a fair honey. These are both shrubs of rather ornamental growth, the first well known in most timbered or mountainous parts of California for its dark serrated leaves and brightly scarlet berries, extensively used in many places in ornamentation at Christmas festivals, etc. Nightshade furnishes a poorer forage all the year round, and bees work on it in winter. There are, in the neighborhood, many other honey-yielding plants generally considered of minor importance. There is, at times, in certain seasons, an abundant supply of the famous white sage, which has been the means of making the attractive and delicious white honey of Southern California so well known in Eastern markets. McD.

The Leland Stanford, Jr., University.

This new temple of thought is born of a feeling that the great schools and colleges are not doing their whole duty by this busy, practical age; that they take too much time and load the mind with a deal of stuff that is useless. "An Oxford education," says Froude, "fits a man extremely well for the trade of a gentleman. I do not know for what other trade it does fit him as at present constituted." Speaking of his plans, Senator Stanford says: "I have in my business experience found that too much of the current college training launches young men on the world void of much practical knowledge of any calling that will enable them to earn their living. Scores of educated youngsters have been sent to me seeking employment, and I could not do anything with them because they would not fit in anywhere."

Now this may not be wholly a matter of observation; perhaps the Senator knows how it is himself. When he was an undergraduate, the chief business of the student was to dig Greek roots instead of living plants; to watch the apnea and flirtation of rabble gods rather

riculum that has become venerable as an old creed that is sacred in memory. Take an illustration that happens to be at hand. The Adelbert College of the Western Reserve University, in the beautiful city of Cleveland, Ohio, may be regarded as a fair average specimen of this class of schools. According to the printed curriculum of this institution for the year 1884, there are during the four collegiate years and two years of preparatory training in linguistic, metaphysical and mathematical studies, 3550 hours of recitation and lecture, while to the whole group of physical sciences are given only 236 hours. Think for a moment of the vast and wonderful developments of our mines of iron, gold and silver, coal, petroleum and salt, and of the agricultural wealth in a large measure due to practical geology, and what are we to think of a course of training that devotes only 54 hours all told to recitations in geology and 1361 to Latin and Greek? Consider the ravages of pests and parasites upon grain, fruit, fruit trees, the diseases of domestic animals and the millions annually lost from these causes, and yet not one hour is given in the whole college course to entomology or biology. Not the slightest aid is given to our farmers and fruit-growers in battling these myriad foes. In this institution there are 535 hours of recitation given to mathematics, largely to the abstract relations of time, space and number, to sines, tangents and arcs; the forms and orbits of the heavenly bodies, and not a single hour to the study of one's own body and the laws of hygiene. The planets and comets may whirl in conic sections, the moons of Jupiter wax and wane, and Saturn move on a retrograde path, much to the confusion of astronomers, and the average man not find his happiness and usefulness aided in the slightest degree by a knowledge of the fact; but if he violates the laws of his body through ignorance or intemperance, his whole life may pass into a total eclipse. This ought they to have done and not left the other undone.

With all due respect for the dons and their ancient dignities, the education that does not put a boy in the way of earning a good, honest living is of very little value, and this we take to be the central idea of Leland Stanford, Jr., University. It is true we have technological and industrial schools that train the brain, eye and hand together, and are doing an excellent work; in the chemical, physical, botanical or mechanical laboratory; in the drafting-room, at the forge, power lathe or planer; in the foundry, machine-shop, printing office, shop, garden, field and stockyard; but the trouble is, they stand alone or as adjuncts of colleges, with slender means, and are looked upon with ill favor by the college dons. What is needed is to honor and dignify industrial training, by taking it under the wing of a munificently endowed university, where a hand-saw and a Greek lexicon are alike honorable. This idea is not novel nor experimental; it is in successful operation at the California State University and several other State Universities; and Senator Stanford's munificent gift is the indorsement of one of our most practical and successful business men. There are some that feign to laugh at what they call the "bread and butter" education, but better a discovery for killing pests than a new accent in Greek; better acrobats, gymnasts and stout baseball players than white-handed, pale young men, reciting whole pages of Horace and unable to earn the salt that goes into their mush.

The History of Iron.

Dr. Andree, of Leipsic, according to *Nature*, discussed before a recent meeting of the Anthropological Society of Vienna whether iron was known in America in pre-Columbian times. Meteoric iron was certainly in use among certain tribes and the Esquimaux, but Dr. Andree thinks that they were wholly unacquainted with the art of forging iron. This conclusion is based on the fact, among others, that while there is ample proof that the Indians (the author under this term including the Mexicans and Peruvians) knew how to obtain and employ gold, silver, tin, copper, quicksilver, etc., we hear nothing of iron mines in the history of the civilization of ancient America. The language itself proves this, for there is no expression for iron. Some writers, it is true, speak of the word panigue as that for iron, but it really means metal in general. Moreover, in prehistoric, or pre-Columbian graves, especially in the rainless regions of Peru and Northern Chili, ornaments of all kinds, weapons and implements are found; but no objects in iron have been discovered, although the Indians placed their most valued articles in their tombs. (Meteoric iron has, however, been found in several mounds in Ohio, by Mr. F. W. Putnam, of the Peabody Museum in Cambridge, both in a natural state and hammered; in the latter form used for the same purpose as native copper, both for implements and ornaments.) Dr. Andree thinks there is no reason to believe that the tools employed in the great masonry work of Peru, such as that at Tiahuanaco, were other than those in use of the rest of Peru, which were the chisels, a species of bronze. The chisels found in Peruvian graves soon become blunted when used on the hard strut; but it is suggested that there was some method of sharpening them easily. Indians have certainly worked a hard stone like nephrite without iron; and there is no improbability, says the writer, in the theory that these chisels were employed.

than the evolution of States and the problem of governments. It is true, they became familiar with the thoughts of Plato and Xenophon, Homer and Sophocles—noble, beautiful thoughts they are, too, but the thoughts of men who lived thousands of years ago, and in times very different from ours. Much time was spent in learning the angles of refraction of the different colored rays, but very little devoted to the handling of microscopes or telescopes in search of objects. They were taught the lines and curve in which the great orbs moved under the combined impulse of repellent and attractive forces, but the knowledge of the geologic growth of the great globe on which they lived, its races of animals, plants and men, was crowded into a corner. The whole system was too far away in space and time to be of any practical use. Under the old system, geometry, trigonometry, mechanics and physics are about the only things of real practical value, and in these branches more time is given to the theoretical and abstract than to the really useful. The whole scheme seemed to be devised to keep the student as far away as possible from all contact with the great actual world.

Nor is this state of things likely to change for the better. There has been a deal of talk but little done, or likely to be done inside the old establishments. It is hard to get out of ruts, and it is just about as difficult to recast a cur-

Passing Events.

Earthquake shocks have again occurred in Arizona and have extended up into the eastern portion of California and Nevada. They were not attended with any loss of life or damage to property. A new volcano is reported as having been found in Sonora, Mexico.

Another astronomical observatory is to be established in this State, this time somewhere in the San Bernardino mountains. Ex-Mayor Spence, of Los Angeles, has given \$50,000 to the University of Southern California for this purpose.

By next week the first electric railroad in this city will be operated for a short distance on Folsom street. Franchises for several electric roads have been granted in other California cities of late.

It is generally recognized that California is entering on a period of prosperity such as it never experienced before. Thousands of people are settling in the State, and new towns are springing up in all directions. The immigration this year will be larger than ever before.

SAN LUIS CHROME.—The San Luis Obispo Tribune says: Mr. Jack, agent for Kalion & Co., of Philadelphia, who are taking out chrome ore in this section, took advantage of the reduction in rates to ship 27 carloads to San Francisco the fore part of the week. This lot cleans up every pound on hand, and unless the market brightens up no more will be mined. We also understand that land-jumpers are causing the company considerable trouble.

Much-Needed Reforms.

We have it on good authority that a certain mining operator formerly of this city, now a resident of New York, has been sued by Eastern parties for a million dollars, being the amount paid him for shares or interests in properties guaranteed by the vender. The present is a civil suit, but, should the defendant, in the event of a judgment being obtained against him, fail to satisfy the same, then the complainants will, it is said, proceed against him in a criminal action. Whether or not the grievances complained of are in this particular case well founded, we are not advised. That more suits have not, however, been instituted against this class of offenders is matter for surprise, seeing how numerous they have in these later years become.

It looks as if no condition or station in life is able to lift men above the temptation to take undue advantage of those with whom they have dealings. Reputation, wealth, title, nothing restrains them from having recourse to sharp practices and even downright fraud for accomplishing their selfish ends. Affluence seems to only whet the appetite for illegitimate gains, and honesty and honor to have become extinct virtues with the human race. To gain admission to the ranks of the plutocracy has become the highest ambition of our kind. Irresponsible adventurers swarm in every field of enterprise! Sharpers, middlemen and promoters crowd the avenues of every industry, more than half the legitimate business of the world having resolved itself into absolute gambling. Even the nobility of England, with all their boasted pride of character, are not above seeking to make money through the sale of their influence and position. In lieu of shares donated them, many of this class will accept the place of directors in any bogus scheme about to be floated on the London market.

And so in all countries and throughout all ranks of society, wherever we look there is seen this same inordinate greed and shameful prostitution of every manly instinct and principle to money-getting. Friendship, fidelity, truth, trust, everything honorable and sacred is sacrificed to this Moloch of avarice.

We are not moralizing but merely making a statement of facts, in the hope that there may be worked some abatement of this all-prevailing crookedness, through the development of a more healthy public sentiment, or through the enactment of more stringent laws adapted to that end, if needs be.

In so far as the mining industry is concerned, we are free to admit there is much that calls for reform. To begin with, let it be insisted that experts and mine-viewers of every kind be held to a more strict accountability, both as regards matters of fact and matters of opinion, than has heretofore been the custom. Any fraudulent act, or even gross blunder, on the part of an expert ought to be considered proof of such unfitness as should debar him from being further employed in such capacity. Companies should be made responsible for every statement contained in any report, circular or prospectus issued by them. So, also, should the mine-owner be bound by all representations made by himself or his agent touching the value of his property. The mine-owner who aalts his claim or misrepresents it in any essential particular ought to be treated as a swindler. Directors who declare dividends that they have not earned, or who earn dividends by gonging out the richer portion of their mines, who levy assessments for their own benefit or for the purpose of freezing out weak shareholders, are simply knaves and ought to be treated as such. What are these acts but conspiracies to cheat and defraud? What is this whole business but obtaining money under false pretenses? Just that, and nothing else. They are crimes, and these smart people are criminals. In saying this we are not expressing a mere individual opinion; we voice the sentiment of all right-thinking men. Nor are we giving utterance to any sudden or new-born impulse. The PRESS has always inveighed against this entire brood of evils, and now only renews its oft repeated protest against their longer continuance. We hope to see the business of mining purged of these abuses before, through long standing, they become chronic and all but incurable. If this purgation shall meantime be extended to such other industries as they in like manner pervade, so much the better.

Cost of Producing Copper.

The wonderfully large increase in copper production in the United States in the past few years has had the effect of cheapening the metal in the markets of the world. When the Montana and Arizona production was added to that of the Lake Superior mines, we produced in this country largely beyond our needs. Still the rate of increase of consumption in the United States is increasing. The principal consumers here give figures which indicate a rate of increase of 16 per cent of 1885 over 1884, and the figures only indicate a part of the consumption. When statistics of copper production were first kept, as far back as 1845, the whole United States only produced 112 tons a year. Now our total production is 74,000 long tons per annum.

The question of cost of production, now that prices are low, is one of interest. At Lake Superior, where the principal mines are, the following records are available:

Mines.	1885.	1884.	1883.
Quincy.....	7.50	8.63	9.00
Osceola.....	10.90	11.24	12.21
Atlantic.....	9.37	10.83	12.56
Central.....	8.83	15.10	15.40
Allouez.....	11.29	13.46	15.98
Franklin.....	10.03	11.62	12.96
Huron.....	11.75	14.78	

The percentage of yield of same mines during same years was as follows:

Mines.	1885.	1884.	1883.
Quincy.....	2.51	2.70	2.86
Osceola.....	1.17	1.21	
Atlantic.....	.74	.76	.68
Central.....	.37	.243	1.90
Allouez.....	.84	.85	1.86
Franklin.....	1.146	1.45	1.38
Huron.....	1.18	1.45	

The cost of production at the Lake Superior mines for 1886 is given as follows:

	Cents per lb.
Quincy.....	6.78
Osceola.....	8.67
Franklin.....	9.34
Atlantic.....	9.63
Tamarack.....	7.49

That of the Calumet and Hecla is not published, but it is believed to be lower than that of any of the others, the rock being nearly twice as rich. These figures include cost of smelting, freight to and charges in New York.

The percentage of copper in the rock treated and the total production during 1886 was as follows:

	Per-centage.	Tons.
Quincy.....	2.54	2,967
Osceola.....	1.89	1,780
Franklin.....	1.88	2,132
Atlantic.....	0.71	1,752
Tamarack.....	2.74	1,832
Calumet and Hecla.....	—	25,259

From this it appears that the leading mines, with a production of about 35,700 tons, can live at about 10 cents per pound for their copper (say £47 10s. per ton, with 2½% discount), while three mines—the Quincy, Tamarack, and Calumet and Hecla—with a production of about 30,000 tons, which is likely to be considerably increased this year, can do so at 7½ cents per pound (£35 12s. 6d. per ton).

With regard to the Montana mines, no information as to the cost of production is made public. At the present time, however, all the different concentrators and smelters are running at full force, with the exception of those of two companies. These, it is estimated, are now producing at the rate of fully 3500 tons of fine copper per month.

James Lewis & Sons, the Liverpool ore and metal firm, speak in their report as follows concerning this subject: With lake copper selling at 10 cents per pound, the value of the copper in Montana matte, after allowing 1½ cents for cost of smelting and 1½ cents for difference in quality, is, in New York, not more than 7 cents per pound; and as the railroad freight from Montana to New York represents 1½ cents per pound of copper, the net proceeds cannot be more than 5½ cents per pound. Whether those mines whose ore does not contain silver of value and only contains 7 or 8% of copper, necessitating concentration and smelting into matte before shipment, can live at this figure seems very doubtful. A reduction in the rate of railroad freights from Montana to Chicago, by both the Northern and Union Pacific roads, of 20%, is, however, shortly expected to be made.

That £39 5s. for Chili bars or £44 per ton for best selected copper in Birmingham leaves little profit to the large Spanish mining companies as shown by the dividends recently declared by Mason and Barry of 2½% for 1886, against 3½% in 1885; the Rio Tinto Co. of 3% for 1886, against 5½% in 1885; Tharsis Co. of 7½% for 1886, against 10% in 1885. Chili bars being

£40 10s. for 1886, against £44 in 1885. The Panulcillo Co. of Chili, which smelted 2193 tons of fine copper last year, has paid no dividend. A small dividend has, however, been declared by the Mansfield Co. of Germany for 1886.

Gleaning the Gold Fields.

They who gathered the first crop of gold from the California placers did their work in such a hasty and wasteful manner that much of the crop was left behind, this waste having been due not more to such haste than to the imperfect methods and appliances wherewith the work was done. The aim of the pioneer miner was to wash as much dirt as possible, to which end great quantities of water were used in machines set at high angles, little or no quicksilver having been employed at first. Operating under these conditions, nearly all of the extremely fine gold passing off with the tailings was lost, and even much of the tolerably coarse went the same way.

As those first in the field washed the auriferous earth in a hurried and careless way, so also did they leave a good deal of the poorer ground unworked, as it would not pay what in those days was considered miners' wages. Between the ground so left and the secondary deposits formed by the rich tailings, a large population has during all these years found material on which to prosecute the business of placer mining in its more ample and inexpensive forms, these operations being outside the quartz, drift and hydraulic workings. There are in this State, Chinese included, between 8000 and 10,000 men engaged in river-bed operations, working over bars, gulches and tailings, ground-sluicing and other kinds of surface-mining. The most of these operations are intermittent, some being carried on only in the summer, and others only in the winter; but these men generally earn good wages for the time they are at work. For the successful prosecution of these branches of mining not much capital is required, hence their attraction to men of small means.

Even though it undergo no enlargement, this province of mining will for a long time afford, as it now does, profitable employment for a great many men. But there is a probability that it will, in some of its departments, be extended. Should hydraulic operations come to be actively resumed, the tailing deposits, already largely accumulated in the beds of the rivers and canyons, would be further increased, adding to the material that will some day have to undergo a rehandling. With the improvements made for recovering the gold from the auriferous beach sands it may be expected that this branch of mining will be reinstated and greatly extended, as these deposits are almost without limit, and have as yet only been skimmed of their cream, so to speak. Then, we have in California a vast area of what are known as dry diggings, being shallow placers where water is so scant that the dirt has to be manipulated by the process called dry washing. Here again, the methods for handling this class of deposits hitherto in use have been so improved upon that we may count upon the latter being extensively utilized in the early future. Aside from our quartz, drift, and hydraulic mines, we have in these partially exhausted placers and other surface deposits resources that will suffice to give California prominence as a gold-producing country for a century to come. Our gleaners gather more than the harvesters in most other gold fields of the world, and our stuhle ground is extensive, with the possibility of its undergoing much expansion.

At the meeting of the Trustees of the Mechanics' Institute, a communication was read from H. G. Hanks, who offered his services to take charge of a special department of mineral exhibits from the Pacific Coast. He had offered his services to the Citizens' Committee, but with what result the latter was silent. Mr. Hanks' letter was referred to the Committee on Special Exhibits.

AN Oregon paper says that smelting works to cost \$50,000 are to be erected at Tacoma, W. T., and will be the only institution of the kind on the Pacific Coast outside of San Francisco.

PORTLAND, OREGON, capitalists are about to develop the quartz and placer mines 90 miles east of Ensenada, Lower California. New machinery will soon be shipped.

Blasting Rock.

The Knox Rock Blasting Company, of Alleghany, Pa., are owners of a patent method of blasting rock, which will interest miners and quarrymen on this coast. The method is to form open ends in quarries having any one of the following characteristics: First, where there is a solid ledge of rock extending indefinitely in two directions from this spot to be opened; second, where the aforesaid ledge is of too great depth to be worked in a single bench, and is massive or without open lines of stratification; third, where in either of the above cases it is necessary that the vertical cut shall not extend beyond the outlines of the block detached; fourth, where there is a "hang" of rock extending indefinitely in two directions.

The invention consists in blasting the rock in predetermined straight lines, and in charging with reference to the character of the rock, in such a manner as to take advantage of its elasticity.

In the opening of quarries having the hitherto-mentioned characteristics, one of two courses is now pursued, viz.: either the rock is channeled with a channeling machine and the ends thus formed worked from, or a blast hole is sunk to a considerable depth, a large amount of powder placed therein, and the charge tamped and fired. In the first case this work is slow, costly machinery is required, and a large number of workmen necessary. In the second case an irregular hole results, an immense amount of stone is rendered worthless, and the surrounding rock is damaged by rents to a greater or less extent. By this method we are describing the rock is split into rectangular-sided blocks from the beginning, and no waste incurred, the time for opening the quarry greatly lessened, and all the labor necessary performed by three men.

In practice the inventor forms the blast-holes first in the ordinary manner. He then reams out oppositely-located grooves in the side of said hole, care being taken that the apices of these grooves are in alignment with each other and with the cut to be made. The holes are then charged, reference being had to the character and elasticity of the rock.

In Fig. 1 of the accompanying drawings is shown a ledge having indefinite longitudinal extension, and not too great depth to be worked in a single bench. *A* is the top and *B* is the face of the ledge, and *C* is the block to be removed. The operator first inserts in the top of the ledge a hole, *a*, whose grooves are so placed that a line joining their apices will form a slightly acute angle, with the face, *B*, on the side next the block, *C*. This hole is then charged, tamped, and fired. The result will be a cut in the direction of the dotted lines extending downwardly through the rock, forwardly to the face, *B*, and rearwardly to a distance varying with circumstances. Immediately upon the charge being fired the sides of the cleft come together, and the crack is imperceptible. The elasticity of the rock is always sufficient to allow the cut to be made, even when said cut fails to reach the face of the rock. Next a second hole, *b*, is made at some distance from the first, and its grooves formed so that a line joining their apices will form an acute angle with the face of the rock on the side next the block, *C*. This hole is then charged, tamped, and fired, resulting in a cut in the direction of the dotted lines. Finally, a third hole, *c*, is made, midway between the cuts first made and its grooves, formed so that a line joining their apices will be parallel with the face, *B*, of the ledge. This hole is then charged and fired, resulting in a cut in the direction of the dotted lines, said cut joining the two former cuts at obtuse angles. There is now a block, *C*, separated from the main body of the rock, widest at the front, and gradually narrowing toward the rear. This block may be divided or worked out in any well-known manner. The bench is then worked out from the two ends, *D E*, the vertical cuts being all made at right angles to the face. Thus all blocks after the first three are perfectly rectangular.

In Fig. 2 is shown a ledge of rock similar in all respects to that in Fig. 1, except that the rock is of too great depth to be worked in a single bench. In this case it becomes necessary to form a false bed before the block *C* can be cut out. The operator therefore first sinks a horizontal hole, *d*, in the face *B* of the rock, at such a distance from the top as may be desired for the bed. The grooves are formed in such a manner as that a line joining their apices may be parallel with the top of the ledges. This hole is then charged and fired, resulting in a cut parallel with the top of the ledges in either direction proportioned to the charge. The block *C* is then cut out in the manner already described, and the ends *D E* worked to the extremities of the false bed. A shot similar to the first is then made to continue the false bed, and so on until the end of the ledge is reached, if desired. Sometimes it is necessary to avoid the back cuts, *f g*, in forming the block *C*. In such case (see Fig. 3) the holes *a b* are placed equidistant from the front and back lines of said block, the hole *c* equidistant from both sides, and the side holes and back hole equidistant from the back corners of the block. The three holes are then charged, tamped, and simultaneously fired by means of electricity. This cuts thus produced simultaneously reach the points of intersection, intercept each other and the gases escape or are condensed before the cuts can be prolonged. Thus a block is disengaged from the body of the ledge without splitting or marring the surrounding rock.

In Fig. 4 is shown a hang of rock, in which it is desired to work. A hole is first bored midway between the two sides of the neck, and the groove made to extend therein, so that a

FIG. 1

FIG. 2

FIG. 3

FIG. 4

Method of Blasting Rocks.

line joining their apices will extend (with a slight diagonal deflection) transversely across the hang. This hole is then charged and fired, and a cut is made which extends entirely across the hang. A second hole is then inserted near the first, whose grooves are so formed as that a line joining their apices has a slight diagonal deflection in the direction opposite to the first. This hole is then charged, tamped and fired, and the result is that a wedge-shaped block is disengaged from the surrounding mass. This may be worked out in any desirable manner, and there remains the two ends from which to work.

It will be seen that the success of all the shots is dependent entirely upon the elasticity of the rock. By making the force of the powder expend itself in right lines, and employing comparatively small charges, cuts are made in the solid faces of the rock, which need not necessarily extend to the surface in either direction. The rock simply opens momentarily and then closes. By combining these "blind" cuts with ordinary open cuts, i. e., where the rock is free on two or more sides, the inventor claims that he is enabled to open and work any imaginable character of quarry without the loss of any material, without throwing fragments, and thereby endangering lives, and with scarcely perceptible noise. The charges are necessarily dependent on the elasticity of the particular rock, and must be properly proportioned thereto. Such a charge as might work in one rock with the greatest success, in another might have little or no effect, and in a third might overdo the work required of it and shatter the rock. This matter can only be settled by actual experiment with each character of stone.

NEWS has been received from Santa Rosalia, Mexico, that the large copper reduction works of the Compagnie Bolo, situated at that place, were partly consumed by fire two weeks ago. The loss is over half a million dollars.

The Shipman Automatic Engine.

The Shipman engine, shown in the engraving on this page, has been widely introduced to meet the demand for a small motor, and so far as we have heard has given full satisfaction in work to which it is adapted. It is in small compass and yet capable of standing high pressure and doing effective work. It runs with kerosene or fuel oil, consequently is cleanly and the fuel is easily provided. It is portable and can be carried by two persons to any desired point.

The Shipman Engine.

The engraving shows the latest improved form, and will give the reader a general idea of its appearance. It can be seen in operation in the Post street end of the well-appointed stores of Oshorn & Alexander of this city, who are the agents for the Pacific Coast.

The uses to which the Shipman engine can be put are beyond enumeration. For running printing presses, it is widely employed. For grinding apples for cider, sawing wood, cutting sorghum, grinding and shelling corn, pumping water, propelling yachts and steam launches, and for nearly all imaginable uses, it has already made a good record. Further information concerning the machines can be had by addressing Oshorn & Alexander, 623 Market street, S. F.

Hay's Nut Lock.

Loose nuts on vehicles, machines, and in fact anything where nuts are used, are a constant source of annoyance; but on thrashing, harvesting and other farm machinery they are worse than elsewhere. This kind of mechanism is subject to all sorts of movements, and nuts are apt to get loose and cause delay and damage.

We give an illustration on this page of a new form of nut lock invented by John Hay, of Elmira, Solano county, who is at present at

Hay's Nut Lock.

426 Kearny street, San Francisco. This nut lock was specially devised to meet the requirements of thrashing machinery.

As will be seen from the cut, it is very simple in construction, but effective. The pawl-plate is set down over the bolt. Then the nut is dropped into the slotted flange washer and screwed down. The corner points of the plate sink slightly into the wood, allowing the plate to bend a little, forming a spring that allows for shrinkage of the timber.

In unlatching, the corners of the plate are raised slightly and the point of a nail or any handy thing placed under the corner, and the whole thing is then turned back. The little pawls in the pawl-plate fit in the slots of the flange in which the nut sets. If there is a strong pressure, the pawls go in between the slots in the plate and the nut cannot get loose. The nut is securely locked and cannot jar back or turn in any way unless a wrench is used. These nut locks have been used by

the C. P. R. R. Co. for five or six months past, and no wrench has been used upon them since. The Shipman harvesters are now supplied with these nut locks, which have been found very efficient. Different sizes are made for different bolts. The simplicity and effectiveness of the device is readily recognized by all who examine it. These nut locks may be seen at Trueman, Isham & Hooker's, or Henry Boll's, in this city.

Astronomical Observatories.

E. F. Spence, ex-Mayor of Los Angeles, and President of the First National Bank of that city, has given a check for \$50,000 to President Bovard, of the University of Southern California, to establish an astronomical observatory. It will be known as the Spence Observatory, and will be eventually thoroughly equipped. Mr. Bovard thinks he will be able to raise \$150,000 more in order to carry out the plans of the founder.

The State will soon be well supplied with astronomical observatories. The largest refracting telescope in the world will shortly be ready for use at the Lick Observatory on Mount Hamilton. The University of California has a telescope of its own, and there are several private observatories in Oakland. The Chahot Observatory, in that city, given to the public schools of Oakland by A. Chahot, is in constant use, and is well equipped. Two astronomers are employed, who are on duty every evening, and any one may visit the observatory on application to the Superintendent of Schools. The Davidson Observatory, in this city, belonging to Prof. Geo. Davidson, of the U. S. Coast and Geodetic Survey, is a very useful institution, and is constantly utilized.

Of course our greatest observatory will be the Lick, for which \$700,000 was given by the man whose name it bears. Its equipment has been so elaborate and expensive, however, that it is now feared the income from the remaining fund will be too small to maintain it with the proper force of astronomers and assistants. The Regents of the University of California are now considering the question of their authority to give \$11,000 per annum from the general University fund toward its maintenance. It is to be hoped that some arrangement will be made so that Prof. Holden and his assistants will be able to carry on their work properly. A mere "show" observatory is of little utility, and when such an immense sum has been expended in magnificent instruments, work should be done and results published.

Grass Valley.

Malville Attwood, who has been for a few weeks at Grass Valley in the interest of the State Mining Bureau, returned this week. He says the place has become a veritable garden spot, the result of the liberal introduction of water. Mr. Attwood resided at Grass Valley early in the "fifties," being one of the pioneer miners. The town has become very beautiful. Every home has its grass plot, flowers and fruit trees. He speaks highly of the enterprise of the Coleman Brothers, to whom the town is much indebted in many ways. The introduction of water is due to them, as also the presence of the railroad. They also have been the developers of the best mine in the district, and, in fact, in the State. From one ore shoot in the Idaho, upward of \$14,000,000 have been taken. At the bottom of the shoot, 1600 feet, the ore looks as well as ever.

William Bourns and John Hays Hammond have put up two model mills at Grass Valley—the North Star and Empire—and both are working well. Grass Valley is decidedly the center of quartz mining in California. The Idaho, Empire and North Star mines have all attained good depths and are doing well. It is a significant fact that the deepest gold mines in the State are paying the best. The arrangement of the two gold-mills put up under Mr. Hammond's supervision are very perfect, and the mills are the best yet built on the coast.

Mr. Attwood has been underground in the more important mines and made investigations, the result of which will be published in the report of the State Mineralogist.

ABOUT 60 men are kept constantly at the Great Eastern quicksilver mine in Guerneville—no Chinese. The average daily shipment of quicksilver is about 15 flasks.

MECHANICAL PROGRESS.

Mechanical Wiseacres.

At regular and frequent intervals some mechanical wiseacre makes, in his imagination, the alarming discovery that there is a constant falling off in mechanical skill; that mechanics 30 years ago were much more competent than they are to-day, and that in this respect things are getting altogether bad. There is never an atom of evidence going to show that there is any truth in this statement, but a good many well-meaning men believe it, and proceed to set up ingenious theories to account for the assumed fact. Of all statements that receive almost universal credence, this is by odds the most stupid. The *American Machinist* discourses upon this subject as follows: Thirty years ago it was comparatively rare to find mechanics who knew more about the trades they followed than was required to enable them to use the tools they worked with. When there was one who studied beyond this he stood out phenomenally, by contrast. At the present time all mechanics study literature relating to their trades, and many of them are close students of the principles of mechanics.

But methods have been changed in 30 years, and a good deal of work that was done then by skilled workmen is now done by those who do not pretend, or at least more than pretend, to be mechanics. Machinery which requires only the attention of a small amount of special skill is made to do much of the drudgery formerly done by the mechanic, hence it is common to find a good many men working in the trades but not at the trades. These are ranked by the superficial thinker as mechanics, and compared with those of the "old times." The mechanic of to-day who has learned his trade is, as he should be with the advantages of better facilities and immensely better opportunities for reading and studying in the proper direction, much better able to follow it intelligently than he could have been 30 years ago.

It would be just as reasonable and quite as correct to argue that business men were less proficient now than formerly, because they have come to make use of specialists in various departments of business—men who make no pretensions to an understanding of more than the particular part they do. But no one would believe this.

Akin to the wiseacre who sees ruin in the waning abilities of the mechanic, is the one who, seeing things quite differently, but equally falsely, evolves the conclusion that machinery has done away with the need of skilled mechanics. Skill of a high order was never more in demand, and it will never come in any trade where machinery can do away with the necessity for it.

As we have at different times pointed out, there is danger that a disinclination on the part of manufacturers to take apprentices may make the supply of the right kind of mechanics scarce, but then the demand for them will be still greater. In any event, they will be more skillful year by year as long as the world continues to grow wiser.

The Bursting of Carriage Tires.

T. J. Flowers, writing to the *Hub*, says:

The bursting of tires is an annoyance that carriage-makers often have to contend with, and the workman is sometimes censured for accidents of this character for which he is by no means responsible. True, poor iron and an imperfect weld may sometimes be the cause, but there are many other and equally common causes over which the mechanic has no control, such as the forces of expansion, contraction and crystallization. These forces are also affected by the elements, over which we have no control. Every tire on every wheel is continually subjected to one or the other of these forces, and sometimes to all combined, with the addition also of percussion. To illustrate, let us consider a tire $1\frac{1}{2} \times \frac{1}{2}$ inch, on a wheel 4 feet in height, and hear in mind that a bar of iron $1\frac{1}{2} \times \frac{1}{2}$ inch is only capable of resisting about 29,868 pounds average tensile strain. Now, when we put a tire on a wheel we give it what is called "draft," or make it smaller than the circumference of the wheel, and thereby give a tension of at least 30° of heat, which is equal to about 4480 pounds tensile strain with the mercury standing at 86° F. Now, suppose it to drop to 23°, or 9° below freezing point, and we have 63° of contraction, which is equal to 8960 pounds, or 4 tons, more tensile strain. Besides this, the iron has lost by cold at least 900 pounds of its original strength, which leaves only 15,528 pounds to resist the force of percussion and the expansion of the rim by frost.

Again, the iron is weakened by bending, and we can learn how much by ascertaining how much its tensile strength has thereby been taxed. We have said that the wheel is 4 feet in diameter, and consequently it will take a bar of iron 12 feet 6 13 16 inches long to hoop it, not allowing for the weld. Now, when this bar is bent to form the tire, the outside diameter is increased 1 inch in consequence of the thickness of the bar, and its circumference is increased over $3\frac{1}{2}$ inches. How are we to account for this increase of length? Has the outside stretched? Yes, for the crushing and drawing forces used in bending were equal, and therefore the outside must have stretched at least $1\frac{1}{2}$ inches, and thereby weakened the iron one-half its original strength, leaving but about

1590 pounds to resist the force of percussion and the expansion of the rim by frost, the latter force being alone sufficient to overcome that amount if it were not that a wheel is a yielding body.

DRY ROT IN TIMBER.—In a recent number of a German technical paper, Herr Gottgetreu treats of the question of dry rot by the light of a summary of known facts illustrative of the subject. He is of opinion that the problem is still to be solved, and, in view of the occurrence of dry rot under some very peculiar conditions, suggests that the germs of the disease may exist in the living tree. In no other way can he explain the decay of wood from this cause, when it was apparently dry and sound and properly used. In Russia there are entire forests from which the timber is taken, experience having shown that it has always been attacked by dry rot. Sometimes a strong solution of common salt, applied while hot, has been found an efficient preservative of timber. The necessity of airing timber in its built-in position is, of course, universally recognized. Professor Farsky, of Terhor, Bohemia, has found that salicylic acid is a preventive and cure for dry rot. At first the acid was used in a dry form, but latterly great success has been achieved with a solution of 5.28 ounces of salicylic acid in 0.22 gallon of alcohol, and afterward diluted. This solution has efficiently protected a floor 800 square feet in area from the spread of dry rot, and has removed it from the spots where it seemed to have established itself. The crystals of acid may be used for this purpose, and its action as an antiseptic is heightened by the admixture of a little carbolic acid. Professor Poleck finds that wood cut in winter and not soaked in water is very susceptible to dry rot, which does not appear when the timber is kept perfectly dry or thoroughly wet. A somewhat high temperature and dampness are almost, though not entirely, essential to the propagation of dry rot mycelium. It is in contemplation to determine by experiment whether timber cut in summer cannot be rendered safe against dry rot by the removal of the bark, protracted drying and prolonged steeping in water.

JAPANESE SKILL.—With all its boasted excellence in manufactures, the Western World has still something to learn from the East. Neither Sheffield nor Birmingham, with all their skill, is able to turn out a sword-blade which can begin to compare with the wonderful sabers of Japan. For fineness of temper and keenness of edge they are unequalled in the modern world, and can scarcely be matched by the blades formerly forged in Damascus and Toledo. A common feat for a Japanese soldier is to cut a pig in two at a single blow; and I have seen hars of lead, and even of iron, divided by these weapons without a notch or imperfection being visible on the blade. While not possessing the marvelous dexterity of the Sikh swordsman, the Japanese would be most formidable adversaries in hand-to-hand fighting. On the occasion of the murder of Richardson and his party—a fate which, by the way, they brought on themselves—a horse's hind leg was completely severed from the body by a stroke from one of the terrible two-handed swords. A sword of superior excellence is preserved as an heirloom in the Setsuma family, and with this blade I have seen a leaf floating on the stream cut in two by merely being allowed to drift against the edge. The Japanese understand the tempering of sword-blades better than any other people, and all the efforts made by the British Government a short time ago to produce as fine an article failed utterly.—*Toledo Cor. Globe-Democrat.*

INVENTIONS WANTED.—An English journal enumerates the following as among the inventions which are specially needed at the present time: Macaroni machinery, good red lead pencils, type-writers that will work on account-books and record-books, indelible stamp-canceling ink, a practical car starter, a good railway car ventilator, better horseshoes, locomotive headlights, an instrument for measuring the velocity of wind currents, apparatus for measuring the depth of the sea without sounding by line, piano-lid hinge which shall be flush on the outside, good fluid India ink for draughtsmen, a good metallic railway tie, an effective cut-off for locomotives, a method of alloying copper and iron, and a molding material for iron and brass casting, capable of giving a mold that can be used over and over again.

UTILIZING THE HEAT OF SLAG.—Mr. Brotherton, superintendent of the American smelter, at Leadville, Col., has patented a plan for generating steam for motive power at the smelter, through the use of slag. By this method the slag is dumped into large shallow vessels, which are afterward run under boilers, and the heat used in generating steam. An experimental test of the method resulted in maintaining 75 pounds pressure on a vertical boiler for seven days. If the plan proves practical, it will result in a saving to the smelter of \$1500 a month.

REPAIRING A STEAM PIPE.—The *Mechanical News* describes an ingenious means of repairing a break in a steam pipe: The break is bound with wood strips, laid close together, and well served around with stout cord or rope. Endwise separation is prevented by more rope crossing the break diagonally, and tied so as to draw the broken parts together. When the wood and the cord get wet with the steam, the joint is even tighter than before, for the wood swells and the cords shorten.

SCIENTIFIC PROGRESS.

PURIFICATION OF WATER BY MOTION.—A discovery has been made by Dr. Pehl, of St. Petersburg, which promises to have a very important bearing on many industrial processes. The water of the river Neva is very free from bacteria, having only about 300 germs in a cubic centimeter. The canals of St. Petersburg, on the contrary, are infected with bacteria, their number reaching 110,000 in a cubic centimeter, even during good weather. The same is true with regard to the conduits of water for the supply of the city. While the chemical composition of the water passing through these city conduits hardly differs from that of the Neva (by which they are supplied), the number of bacteria reached 70,000 against 300 in the water freely taken from the river; and the worst water was found in the chief conduit, although all details of its construction are the same as in the secondary conduits. Dr. Pehl explains this anomaly by the rapidity of this motion of the water, and he has made direct experiments in order to ascertain that. In fact, when water was brought into rapid motion for an hour, by means of the centrifugal machine, the number of developing germs was reduced by 90 per cent. Further experiments will show if this destruction of germs is due to the motion of the mass of water or to molecular motion. If this discovery of Dr. Pehl's be confirmed, it will become possible to destroy bacteria and render a water comparatively pure, simply by passing it through a centrifugal machine. The subject is of special interest to brewers, who suffer, perhaps, more than any other manufacturers, from the attacks of bacteria.

EXPERIMENTS WITH STATIC ELECTRICITY.—According to the *London Electrician*, the following interesting experiments were described by Mr. Boys at a recent meeting of the Physical Society: "If sealing wax or any similar sticky substance be melted in a cup and put upon the conductor of an electrical machine, as in one of the old-fashioned experiments, it will begin to throw out threads in an extraordinary way; the fibers are large when the resinous matter is very hot, and each fiber shoots out as a cylinder with remarkable speed, then breaks into beads. These minute beads can be made to patter against a drumhead, and make a noise upon it like falling rain. The cup containing the melted wax should be inclined from the operator, and from the electrical machine before the latter is worked, or be covered with the most invisible sticky web imaginable. A cup of burnt india-rubber tubing so treated sends out almost invisible filaments. Canada balsam is the perfection of a material for producing sticky threads. When a candle is held near a cup throwing out such electrical filaments, they shoot into the flame and sometimes cover the candle; sometimes they will stop as they approach the flame, then turn back and go into the cup from which they started, in consequence of discharging their electricity into the flame. In a few minutes, miles of these sticky threads can be made, and, as they break into beads, the method affords a ready means of powdering such of these substances as are not easily pulverized in any ordinary way."

HOW OIL STILL THE WAVES.—Any seaman having a doubt as to the efficacy of oil in stilling heavy ocean waves should read the article on this subject in the *Forum* for November of last year, written by Professor Thurston. He touches the philosophy of the matter by saying that "when a drop of oil is placed upon the surface of water it first rapidly spreads in all directions, forming a film of exceeding tenuity," and its effect upon the sea surface is "as if a sheet of carpet of a thin, flexible, elastic and yet tenacious substance, like rubber, had been spread over the waves." This effect is largely due to the fact that the breaking of waves is facilitated by large surface tension and small viscosity of the water, while small tension and great viscosity hinder this breaking, especially when combined with considerable tenacity of the surface molecules. As Professor Thurston shows, oil on the water forms a new surface having great superficial tenacity and small surface tension. For this reason it reduces the liability to surf, and when poured on the water in a fine, trickling stream reduces to smoothness or to unbroken rollers what was before a frightful mass of breakers.

INTERESTING REPORTED DISCOVERIES.—A New York press telegram from Meadville, Pa., May 6th, says: Dr. C. C. Carroll, of this city, after years of experimenting, has discovered a method by which aluminum can be cast, soldered and welded. It is claimed by metallurgists and artisans that this is a very valuable invention, since it incurs the use of aluminum for many purposes on account of its extreme lightness, strength, and non-oxidation by exposure. It is already successfully employed in the manufacture of dental plates, for which it is apparently admirably adapted. In the course of his experimenting, Dr. Carroll believes he has also discovered the law governing the disintegration of iron structures employed in the construction of bridges.

GLOW LAMPS.—At one of the recent meetings of the British Society of Arts, Major General C. E. Webber read a paper on glow lamps, in which he gave the results of his observations as to the best method of arranging them. He

said that as the surface of the filament is so much smaller than that of a gas flame, its brilliancy, when giving an equal light, is such that it produces sudden slight paralysis of the receptive powers of the eye. The result is that persons often complain of the want of light in a room fitted with glow lamps, although the illumination is actually greater than it would be with gas. The remedy for this is that glow lamps should be invariably shaded from the eye, and he placed as near as possible to the object to be seen. General Webber also described the manufacture of glow lamps, mentioning incidentally that the filament of the Victoria Brush lamp is made by squirting a viscous solution of cellulose into a precipitating solution, a process which produces this most perfect uniformity of section.

THE DISCOLORATION OF PAPER.—According to experiments made by Professor Wiesner, of Vienna, rapid discoloration is only noticed in paper made from wood pulp, and must be clearly distinguished from the discoloration of old, good rag paper. Wood-pulp paper, when exposed to the almost perpendicular rays of the sun, showed the beginning of discoloration within an hour. No change, however, was noticed while the paper remained in the dark, even with the increase of temperature caused by the sun's rays, and it was naturally concluded that only the light is instrumental in the discoloration of wood-pulp paper. Further experiments proved that the discoloration of wood paper is a process of oxidation dependent upon the light; also that, while dampness is favorable to discoloration, it is not a necessary element of the process. The power of the light is important for the discoloration, for, when exposed to gaslight, the color only changed after four months. Professor Wiesner recommends the following to aid in the protection of wood-pulp paper. Sunlight is the most injurious light. Very weak, shaded daylight, especially in very dry rooms, will take but little effect. Gaslight, owing to the limited refraction of its rays, is almost wholly harmless. On the other hand, electric light, and, in fact, every light having strong refraction, is favorable to discoloration. Therefore, gaslight should be preferred to electric light in illuminating libraries if the danger of discoloration is to be considered.

THAWING FROZEN GROUND.—It often becomes necessary in northern latitudes, and sometimes among the mines of our own State, to make excavations in frozen ground. Unless the frost is first removed from such ground, its excavation is almost as difficult as though it were solid rock. It has also been found that the artificial removal of frost from ground is very tedious and difficult. Some one has recently called into use quicklime, and, it is said, with excellent success. The surface where the excavation is to begin is covered with alternate layers of lime and snow. The lime becomes slaked, and heats the soil so effectually that after 10 or 15 hours it can be dug up with the greatest ease, even where the cold is excessive. It goes without saying that where there is no snow water can be used. This makes the process a little more complicated, but it is just as efficacious. This method is restricted in its application to those cases in which the delay of a day or night is not inadmissible.

AN ACID PROOF BRONZE.—Mr. P. Reitz has devised a bronze composition which is not attackable by acids and alkalis. This alloy is adapted for use in all those cases where recourse is had to ebonite, porcelain and other materials, which, while proof against acids, are exposed to wear and are for the most part very costly. The alloy consists of a mixture of copper, lead, zinc and antimony, and consequently of materials already employed in the composition of bronzes; and so it is to the judicious proportions of the mixture that Mr. Reitz attributes the new results obtained. He melts in a crucible 15 parts of copper, 2.34 of zinc, 1.82 of lead, and 1 of antimony. This alloy is worked as usual. It is adapted for use in the manufacture of chemical products, for washing apparatus and various utensils.

RESISTANCE OF SNOW TO RIFLE BALLS.—Some experiments on the resistance offered by a bank of snow to a rifle bullet were made recently at Ottawa, by Col. White, which were most interesting. It was found that the Martini bullets fired into a bank of well-packed snow were completely spent after traversing a distance of not more than four feet. Snider bullets, in hard-packed snow mixed with ice, but not hard enough to prevent digging into it with a sheet-iron shovel, did not penetrate more than about four feet; in perfectly dry snow, packed by natural drift, but capable of being easily crushed in the hand, a bullet penetrated about four feet, and in loose-drifted, dry snow less than even feet, though fired from points only 20 or 30 yards distant.

SOME ALLEGED NEW ELEMENTS.—A. Pringle, according to the *Chemical News*, claims to have discovered six new substances in some lower silurian rocks in Selkirk. Five are said to be metals and the other is a substance resembling selenium, and which he calls *hesperium*. One metal is like iron, but does not give the rhodanate reaction, nor that with tannin. Another resembles lead, is quite fusible and volatile, and forms yellow and green salts; another is black, and he names it *erobodium*; the fourth is a light-gray powder, and the last is dark in color.

In a Mica Mine.

One of the finest mica (sometimes wrongly called isinglass) mines in this country is located on Fletcher mountain, in the little township of Grotou, N. H., about two miles from Rumney depot, on the line of the Boston, Lowell & Montreal railroad.

A cool, bracing breeze stirred the budding maples as we, rested from our early climb, again set forth to reach this industrial Mecca. Half-way up the steep incline we found the airy home of the teamster, a jolly Frenchman, perched on a broad, mossy howler, with its cellar open to the day. But this humble domicile commanded an unrivaled view of Franconia's misty ranges. Nearer by could be seen the white crown of Moosilauks, the Black and the Waterville mountains, and, seemingly at our feet, Loon lake, a perfect gem, reminding those who have been abroad of the lochs for which Scotland is famous. Still our aspirations led skyward, and soon we have reached the scene that has pleased so many with its novelty. A speedy introduction to the overseer followed, and then we were shown an animated sight. Looking down two pits, each some 35 feet deep, their sides bright with layers of almost pure mica, embedded between rocks of feldspar and quartz, we saw the companies of toilers. Some, on temporary stagings of rough boards, half-way up the pit, were wielding six-pound hammers, striking in regular succession the narrow-headed and glistening drills, held by their mates, and sinking deep but narrow cavities for the reception of the blast; some were grouped with pick and shovel in the openings below, some were pumping water that had trickled from above, and here and there were parties pushing the loaded cars to the dump, and all were hardy, bronzed-looking, yet intelligent help.

The mica lies in veins, averaging from one foot to five feet in thickness, and is often blown out in blocks, or pieces weighing from 20 to 40 pounds. This is broken into suitable shapes for carriage in large baskets, and, after being partially cleaned, is borne to the cutting-shop. This is a long, commodious building, with a wide, stationary bench running the length of both sides, having shelves above. Some five feet apart are placed steel shears having a foot and a half blade and a long handle fixed to each bench, and manned by as many strong-armed, husky workmen, of whom 15 are here employed. On the shelves before each cutter are ranged the hardwood patterns by which the mica is cut into various sizes. The proper pattern, with the mica beneath, is held in one hand, while with the other each man rapidly plies the sharp shears. The day's work is piled up before them in square compartments, and put into pound packages, ranging in size from 2x3½ inches to 8x10 inches. It is used mostly in etoves and ranges, but it is also cut for doors and electric lights.

At one end of this building sat two men splitting the layers of mica brought from the mine, with instruments resembling oyster-knives. Felling into conversation with them, we learned that they daily find specimens strongly resembling animals, utensils, etc., and were shown pieces that closely counterfeited the form of elephants, rabbits, mules, etc. One of the employes in the finishing-shop showed us a mica woman, wearing a 17th century bonnet, and another had a specimen that had appropriately been named "The Old Man of the Mountain." We also saw some curious pieces which, by contact with iron-rust, had impressions closely resembling leaves, mosses and ferns; salmon-colored mica from Canada, and some very beautiful iridescent specimens from North Carolina.

In the company's office, on the Brook road, we were shown a huge sheet of mica 2 feet long and 1½ wide, almost as clear as crystal, and a six-sided prism of nearly pure beryl, weighing 90 pounds, both of which were found in the Valencia two years ago. It is a singular fact that platinum, one of the hardest ores known, will melt in a vessel made of mica. Heat does not affect this singular product, but water in time will injure it. The layers may also be split thinner than a wafer, and often reflect all the colors of the rainbow. We took a peep into the smithy, and saw in the glowing coils of the forge a dozen or more drills of as many different sizes, at red heat, while many other implements used in the mines were strewn around, waiting their turn to be sharpened or repaired. About 50 hands are employed in or around this mine.

Descending to the finishing-shop, at the foot of the mountain, we were ushered into a large light room on the ground floor, which was thickly carpeted with the imperfect layers of mica cast aside by the female help. None of the mica from this mine, however, is thrown away, for even the refuse is ground up, mixed with oil, and used as a lubricant. In this room, ranged on stools, with trays upon the benches before them to receive the perfect pieces, sat a dozen young women, each holding a small knife of the pattern used by shoemakers, with which they rapidly and dexterously split and cleaned the shining substance. In the storeroom we saw small boxes, in form and size such as usually contain a dozen farmers' scythes, yet two of these receptacles can hold a thousand dollars' worth of mica. One hundred pounds is usually put in a box. All the marketable product of the mine is shipped to Utica, N. Y., whence it is sold to the trade.—*Boston Transcript.*

USEFUL INFORMATION.

Wares of the Japanese.

Metal work and lacquer are the chief triumphs of the Japanese craftsmen. The hardest iron, tempered to parry the blows of the keen sword of the Samurai, is by the Japanese Cellinis hammered into dragon-shaped helmets and cuirasses, life-like in their bold relief and wonderfully light in weight. The most refractory material—cold-tempered iron—yields in the hands of Metado or Miochin effects like those of plastic wax. There are metal sword-guards of mysterious alloy, having an indescribable variety of shade and reflected color known only to the Japanese—chased, pierced and encrusted with silver, gold, shibuichi, shakudo and bronze. They are worked with a patience and technical skill which are the despair of European workmen. In an inch of parti-colored metals are seen landscapes, flower pieces and battle scenes. Nearly all the pieces are signed by artists of the fifteenth to the eighteenth century. The specimens of lacquer, of which there are some hundreds, begin with the fifteenth century. Almost every piece is a study. To create these works the artist, living in the castle enclosure of his feudal prince, would spend months, and even years, patiently building up layer on layer of translucent varnish, slowly hardened and polished; powdering it with a shower of gold; raising flowers or figure subjects in relief and modeling every petal and stamen with poetical feeling and Asiatic patience. One piece is signed "Kami No Waza," showing that the artist had been raised to the honorary title of Governor of the Province of Waza, and other pieces signed "Hogen," an equivalent to baron, for the feudal lord and his artists lived in mutual intimacy and honor. A tea jar was a gift from a prince to a Daimio, and battles have been fought for what are now the bibelots of the modern connoisseur.

What some will think a notable deficiency in the collection is the absence of the large pieces of cloisonne enamel with which modern Japanese magazines and some collections are profusely decorated. But these are all apocryphal in date. The Japanese in the past were poor hands at enameling, and the early cloisonnes, of which specimens are shown, are all small and very inferior in hardness and brilliancy to the work of the Chinese. The only exceptions were the translucent enamels of Hirata Donis, in the seventeenth century, and his successors; enamels which were chiefly confined to the decoration of sword-hilts and medicine-boxes, and were objects of personal adornment rather than decorative furniture.

A collection of Japanese pottery and porcelain is carefully selected and interesting; although here, also, the Japanese, while excelling the Chinese in their pottery, never rived the brilliant enamel glazes which have made the ruby, apple-green, crushed-strawberry, turquoise, imperial yellow and other enameled china of the early Chinese dynasties inimitable. The specimens of the old Sateuma faience, gold Bizen ware, the Huata porcelain and the early Imari deserve special study. They will remove many illusions, for the market is flooded with poor imitations. The pieces shown justly maintain the reputation of the great artists of the seventeenth century—such as Kakiyemon, Ninsei, and Kenzan.

How to Design a Monogram.

Scarcely anything, says the *Art Amateur*, seems so easy as to design a monogram, yet we see very few successful ones, the most of them being a mass of mixed-up letters and ornaments of which we can find neither the beginning nor end. There is a law regulating the designing of everything, and it is this law which the true designer keeps in mind and applies to his work; the effects of obedience to this law and its violation are seen as clearly in the design for a monogram as in the design for a cathedral.

First, there should be harmony of composition—that is, the letters should so emphasize, subdue or control each other that the composition should impress us as compact, appropriate, and, being so, beautiful.

In the second place, there should be no unnecessary ornamentation; there should be a quiet and peace about the design which will always please the truly artistic. Looking at some designs, we get the impression that ornament was so plentiful that the designer saw no other means of consumption than that of burying his designs in it, for we see that there is a mass of curves, angles, shades and leaves, but nothing else.

Third, simplicity of lettering is an important requisite, as there should be no possibility of mistaking an E for a G or C, and the boundaries or outlines should be well defined.

Fourth, the order of sequence of the letters should be carefully attended to.

The common idea is that a certain number of letters are given with which to make a pleasing design, and, so far, that impression is right; but there is something beyond this. There is the art of so placing the letters that one can distinguish at a glance the first, the center and the last letter. Now, the rule to be observed to secure this result is as follows: The last letter of the monogram must be the principal feature, and must be the largest, the boldest and the heaviest letter; then the first letter must be the next in size, but the lightest in outline and color; then the central letter must

be the smallest and of an intermediate tint. If the monogram is of four letters, the two intermediate must be of the same size, and the second letter lighter in outline and color than the third.

Wood Pulp Instead of Plaster of Paris.

An important discovery has just been made at the Sognedal pulp factory in Norway, after several years' experimenting, wood pulp being used for the manufacture of the kinds of building ornaments which are generally made in plaster of Paris. The pulp is first ground from wood, and then, by a machine, pressed into any kind of ornament, such as ceilings, friezes, bas-reliefs, rosettes, etc., which are quite as well finished as similar articles of plaster of Paris. Another feature is that the articles made from the pulp show painting or gilding to great advantage. Tests have also been made with regard to their strength, by dropping them from various heights or hurling them against stone walls, the results being highly satisfactory. Thus, for instance, a bar of this material one foot in length, one inch in thickness, and five inches in width, neither broke nor sustained any serious injury on being hurled with full force against a stone wall a couple of yards distant. Naturally, too, this material is far lighter than plaster of Paris, an important advantage, as no great harm would be caused to a person by ornaments made from it falling upon him, which is otherwise with those made from plaster of Paris. It should also be mentioned that pulp ceilings, friezes, etc., are, by the hardness and compactness of this material, impervious to wet, and that they may, if desired, be fastened by nails or screws. Finally, the inventors state that ornaments made from this material cost only half the price of similar ones made from plaster of Paris. This discovery will, it is believed, give great impetus to the pulp factories which are now quite unprofitable through the low prices of paper, and the utter failures which have attended the vast production of the latter, direct from wood pulp.

NATURAL LUBRICATING OIL.—A well bored at Herscher, Illinois, to secure water for stock, throws out a barrel of dark-brown oil each day. Experts from Pennsylvania pronounce it fine lubricating oil, worth \$9 per barrel, and have leased land to sink several wells.

GOOD HEALTH.

The Cancer Discussion Continued.

We give herewith another case of successful treatment—this time a case of recent occurrence: Mrs. A. C. Vandenburg, 327 Bryant avenue; age 36; one child. No cancer in family. Breast caked after nursing, as the nipple was sunken. Saw Dr. Van Denbergh; he cut it. Saw Dr. Kane; he said it might get well "but will take a long time, your health being very poor." He said he could do no more than Dr. Van Denbergh had done. She did nothing with it for one year thereafter; when, as it was more painful and getting larger, she went to Dr. Kane, who wanted to cut it out. Saw Dr. Van Denbergh again and told him she would go to —; he said he "would bet his life she could not cure her, that it was cancer and he knew it a year ago, but did not like to worry her, as there was no cure for it." One medical gentleman whom she consulted said he might be able when he had taken it out to tell exactly if it was a cancer. Saw — on November 4, 1886, and remained under treatment till January, 1887, and left perfectly well. No return, and health good; kept getting stronger all the time, and felt great relief from pain.

Would it not be in the interest of medical science, and of humanity as well, if the doctors above mentioned would call upon Mrs. Vandenburg and ascertain for themselves whether or not she has been cured of what one of them pronounced so unmistakably a cancer, and who was so sure it could not be cured that he was ready to stake his life upon the result; while another, too cautious to express an opinion of the character of the tumor, nevertheless advised that it should be "cut out." We may remark that this patient was sent to the practitioner in question by a gentleman of thorough medical education and of the highest standing in educational and religious matters in this city. He recommended the patient to such treatment as a matter of humanity and in disregard of the obstructive code of ethics which the medical fraternity have thrown around themselves. That gentleman has expressed himself as perfectly satisfied with the result attained.

Many of our exchanges are calling attention to the character and importance of this discussion and freely expressing an opinion decidedly unfavorable to the course which is being pursued by the medical fraternity of this city in regard to this discussion. We shall soon commence to publish the "opinions of the press" in relation thereto.

PNEUMONIA AND TYPHOID.—HOW TO CURE THEM.—A correspondent of the *Baltimore Sunday News* says in regard to pneumonia: If you will permit me, I will give an unprofessional remedy or means of cure by which nine cases out of ten can be relieved in less than 24 hours, and cured in less than three days, instead of a "couple of weeks' time." Give some warm stimulating tea to help counteract the cold. Apply as soon as possible a poultice of

hot onions to the chest and renew the application frequently until relief is obtained. The onions should be mashed and heated with a little lard in a vessel suitable for it, or take some life everlasting—if it cannot be had, any common herbs may answer; boil it well with vinegar and make a mush with cornmeal. Apply a poultice of this as hot as it can be borne upon the chest of the patient and repeat at short intervals. The congestion will soon be relieved, the pain will cease, the blood will flow freely in its accustomed channels, and the patient will be out of danger in 24 hours. I would advise to be given at the same time, as a valuable assistant, a purgative composed of equal parts of cream of tartar and aloes. Some pills, which the family may have been accustomed to use, may answer just as well. The simple thing is to assist nature to throw off disease. The same treatment will cure typhoid fever, but in this disease I know of many cures having been made by simply putting mashed raw onions to the soles of the feet. In high stages of the fever they will soon turn dark; several applications generally give relief. They induce perspiration, extract the fever, relieve the pain in the head and effect a cure. If these simple directions are observed, there will be very few deaths reported in our city from pneumonia or typhoid fever.

Valuable Suggestions on Diet.

Most authorities are of opinion that cheese is indigestible, yet even on this point doctors cannot agree.

A distinguished French chemist has suggested that to make cheese digestible, a quarter of an ounce of potash should be added to every pound of cheese; while a German chemist has experimented upon several kinds of food—such as cheese, meat, milk and eggs—and he boldly declares that cheese is no more indigestible than meat and many other articles of diet.

Suppers are usually condemned. Some doctors assert that suppers are not only unnecessary, but positively harmful; that sound sleep cannot be obtained after them, and that three meals a day are sufficient.

On the other hand, others are of opinion that a light supper is necessary to procure sound sleep. After a meal, they say, blood is drawn toward the stomach to supply the juices needed in digestion. Hence the brain receives less blood than during fasting, becomes palsied, and the powers become dormant. Sleep, therefore, ensues.

A doctor says that recently he was called at 2 A. M. to a lady who assured him that she was dying. The body was warm, he says, the heart doing honest work. To her indignation he ordered buttered bread to be eaten at once. Obeying, the "dying" woman was soon surprised by a return of life and a desire to sleep.

Milk is generally considered a peculiarly nutritive fluid—indeed, a perfect food—and therefore suitable for persons of all ages when it agrees with their stomachs; yet no less an authority than Sir Henry Thomson states that "for us who have long ago achieved our full growth and can thrive on solid food it is altogether superfluous and mostly mischievous as a drink."

He also says that the primary object of drinking is to satisfy the thirst, and that water is more powerful to this end when employed free from admixtures with any solid material. Chocolate, thick cocoa, or even milk, are therefore not so efficacious in allaying thirst as water.

"So plentiful is nutriment," he adds, "that the very last place where we should seek that quality is the drink which accompanies the ordinary meal."

In this respect, at any rate, Sir Henry Thomson is at one with the vegetarians.—*All the Year Round.*

DANGER FROM HOUSE PLANTS.—Dr. Sanlbury found malarial fever to be propagated among persons sleeping in a room in the windows of which had been placed a box of earth from malarious soil. House plants cultivated in pots filled with malarious earth are a constant danger. The germs grow luxuriantly in the moisture and warm air of closed rooms. Dr. Eichwald, Professor of Clinical Medicine in the University of St. Petersburg, has given to the public facts concerning a patient of his—a lady with malarial fever—who was easily cured by treatment when confined to her chamber, but who quickly relapsed on remaining during the day in her parlor. The easy cure and constant relapse went on for a long time. At last the doctor, having become suspicious of the flower-pots, removed them from the house, and there was no further recurrence of the disease.

THE BEST TIME TO BATHE.—It is best to bathe just before going to bed, as any danger of catching cold is thus avoided, and the complexion is improved by keeping warm for several hours after leaving the bath. A couple of pounds of bran put into a thin bag and then in the bathtub is excellent for softening the skin. It should be left to soak in a small quantity of water several hours before being used. The internal aids to a clear complexion are most of them well known, and the present season is the best for a thorough cleansing and purifying of the blood. The old-fashioned remedy of sulphur and molasses is considered among the best. Charcoal powdered and taken with water is said to be excellent, but it is most difficult to take. A strictly vegetable and fruit diet is followed by many for one or two weeks.—*London Lancet.*

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AT SUTTER CREEK.—Cor. Amador Ledger, June 4: Everything at the Wildman is running in good shape. The water is being taken out as fast as the men can lower the pump. They have sunk two prospect-holes south of the shaft, and have discovered excellent rock. The Amador canal, after a protracted siege of mishaps, is running smoothly again. Pipe-laying and repairing are about finished. Knight & Co. have received an order for a 500-horse power water-wheel to go to Alaska.

CHICAGO.—Ledger, June 4: This promising property, south of Plymouth, and little to the east of the New London, is about to be started up with renewed vigor. It has been idle for the last six weeks, on account of a number of attachment suits commenced. These are in a fair way of settlement. The mine is owned one-half by John Cupps, and the other by S. F. parties, who are providing the capital necessary for its development. A double-compartment shaft, four feet nine inches by eight feet two inches in the clear, has been sunk to the depth of 186 feet, following the course of the ledge. The shaft has been more or less in ore the entire distance, but the size of the ore body is unknown, as no drifting has been done to determine its width. The footwall appears to be of slate formation, and the hanging-wall of the greenstone character. A large quantity of quartz has been extracted in sinking, which it is estimated will average at least \$7 to \$8 per ton. Assays made of the rock have indicated a value of \$13 per ton. It is the intention to sink to the depth of 2000 feet, and then open up levels while the shaft is progressing. As soon as timbers can be got on the ground, work on the shaft will be resumed.

MCKENZIE.—The first cleanup of the Huntington roller quartz-mill operating on this claim, near Irish-town, six or seven miles east of Jackson, was made this week. The mill was running seven days, crushing 50 tons per day. Everything taken out was run through, not only quartz, but dirt, and the ledge matter on either side of the vein. The result was 6½ pounds of retorted gold, estimated at \$200 per pound. This would give \$1350 as the result of the week's run, or an average of \$4 per ton. Mr. McKenzie is highly pleased with this output. The cost of mining, milling, etc., does not reach \$1 per ton. He is talking of putting up several more Huntington quartz-mills, as the pay rock is large enough to give employment to four at least.

MISCELLANEOUS.—A contract has been let to run a crosscut 100 feet at the tunnel at Middle Bar.

Butte.

AT FORBESTOWN.—Orovine Register, June 2: Mr. Henry Vail, an experienced quartz-miner of Forbestown, says of the mines of that region, three are in active operation and two more are being developed. These promise well, but not enough has been done upon them to give them a fair test. The quartz at Forbestown is nearly all mixed with sulphurets, and there is but very little free-milling gold ore to be found. It is rich rock and will pay immensely, when properly handled, but it cannot be worked to a good profit in the ordinary manner of crushing rock in a mill. Mr. Dewey, who owns one of the lodes, is to treat the ore by a chemical process. The batteries Mr. Dewey will use are small and compact, having four discharges for the pulp, and he claims to be able to work 15 tons in 24 hours with five stamps. Mr. C. J. Nickerson, of the Golden Queen mine, is thoroughly testing his ledge before putting up any mill. While Mr. Dewey will treat the ore chemically, Mr. Nickerson intends to erect chlorination works. These ledges can be worked to great advantage, as the mills can be run by water-power. Gold quartz is not the only mineral in the vicinity of Forbestown; three miles from there, there is a large body of iron ore that some time will become very valuable. There is also a vein of black oxide of manganese, that is a substance extremely valuable in making dyes of different kinds. Near by there is an extensive deposit of marble—black, blue, green, and variegated, as well as a fine white marble. There are also large ledges of very excellent soapstone.

Calaveras.

AT MURPHYS.—Cor. Calaveras Record, June 1: The mining industry of this and surrounding districts has settled down to a matter-of-fact proposition. Pulverizers and stamps are in continuous motion. Mines are being prospected for permanent working. The Oro Plata stands at the head of the list of companies in this district for its perseverance in prosecuting developments, thoroughness in business details, prompt payment, and systematic management. There is not in the State, perhaps, a quartz-mill better adapted for the working of refractory ore than the Oro Plata Co.'s mill. All who visit it are struck with admiration with the perfect system with which the ore is treated. Quartz is at present being hoisted from the Red Wing level only, in sufficient quantities to run the four pulverizers. The large excavation, the quartz from which supplied the stamp-mill, is not being worked at present, and the stamps are now inert in consequence. The company contemplates driving a tunnel from the French gulch side of the hill, tapping the Oro Plata and Red Wing mines at a greater depth, thus greatly facilitating the extraction of ore in the various openings and particularly from the sink of the 300-foot shaft of the Oro Plata, which was shut down temporarily a few years ago on account of the abundance of water. From this tunnel all of the company's mines can be worked with greatly lessened expenses. Another mining enterprise, now reaping their reward, is the Central Hill Gravel Co.—almost in the town site—McCormic, Bisbee & Thomas.

El Dorado.

MOUNT PLEASANT.—Mountain Democrat, June 4: Additional men are being put to work on the Mount Pleasant, and a general revival of work is noticeable in this mine. Other mines are coming forward rapidly in the same locality, and it is now an assured fact that the camp will be livelier than ever this year. Peter Gross this week sold his mine on French creek to S. F. and St. Louis capitalists. We understand that the sale is for a considerable sum,

that will again put Mr. Gross in comfortable circumstances. We hear it reported all the way from \$12,000 to \$200,000. Mr. Gross will, we understand, be retained as superintendent of the mine at present.

Fresno.

WILL BUILD A MILL.—Fine Gold Miner, June 3: Louis Wilson, owner of the Wilson mine, tells us that he is seriously considering the proposition of putting up a mill on his property. Ore from the mine has been hauled a distance of several miles to Smith's arastra, on Fine Gold river, below Hildreth. The arastra can work about a ton a day, but there are no facilities of saving the rich sulphurets. Attempts have been made to prevent all the sulphurets from going to waste by running the tailings over blankets, but more than half were lost. Mr. Wilson's mine is one of the richest in the district, and with proper machinery would undoubtedly yield big returns.

HILDRETH MINING NEWS.—Donahoo & Emmons have attached Taylor & Fraiser's mine, which seems to have turned out contrary to the expectations of its owners. Fraiser went to S. F. some time ago, leaving the wages of the miners unpaid. During the past month the Abbey mill crushed about 600 tons of ore. Developments in the mine during the past week show no change of any note, except that on the 500-foot level higher grade ore was encountered. Everything is running smoothly as usual. The Francis & James people are expected to return from S. F. during the next few days, where it is said they have been purchasing heavy machinery. Everything about the mine looks encouraging, and the body of the ore opened up at the 235-foot level will be prospected further. Superintendent Wallis, of the Hildreth, feels much encouraged over developments. During the past week he has had men putting in a tank and pump at the 300-foot level in order to more easily handle the water; sinking was discontinued while this work was being done. A level is being opened at the 200. Prospecting has been going on toward the west with favorable results. Thirty men are on the pay-roll. The mill is handling 12 tons a day. The tunnel at the Hampton mine, on Prussian hill, is in 385 feet; an upraise from the face is supposed to be within 15 feet of the upper tunnel with which it will connect. The ore in this mine is rich. Messrs. Wallis & Webber are interested in the Daily prospect, located about 700 feet east of the Hildreth mine. The location is in a good locality, and the vein, which is very small, contains much free gold. Mr. Crooks has been taking out some good ore from his property on Prussian hill, which he works through a horse arastra. This property has been worked in a small way for seven years. The Beck mine below Bates is shut down for the present. The miners around Fresno flats feel considerable interest in the development of several locations on Mount Raymond. Some very rich silver ore has been brought in by prospectors. Work at the Zebra is suspended for the present, owing, it is said, to the possibility of a change of bands. The Hanover mill will be put in repair and run on custom ore. Work on the mill will be begun at once.

Mariposa.

SAXTON'S CREEK.—Cor. Mariposa Gazette, June 4: Wm. Dubosq, Geo. Lacy, and Tom Richard made a visit to the Buena Vista mill and mine. They found everything in good, ship-shape order. Messrs. Chesney & San Pedro have great faith and say the Buena Vista mine will be all O. K. in a short time. They will crush a few hundred tons, and if it turns out, as every one hopes it will, to be a good paying mine, the mill will be built on the mine. There is plenty of water in the mine to run a 20-stamp mill. The mine runs east and west. At 100 feet deep is a pay chute of two feet, and 30 feet deeper is ore of six feet in width, dipping east and west over 50 feet in length and the vein 15 feet wide. They are only taking out the rich pay chute at present, and are leaving the balance of the vein, nine feet. They take out from 20 to 25 tons every 24 hours, with six men, three-hour shifts, two men to each shift; and all picking ground, no blasting to be done.

Nevada.

NEAR THE DELHI.—Cor. Nevada Transcript, June 1: The Delhi mine is now paying well. The extension of the Delhi ledge was recently purchased from Wm. Huff and the Curnow brothers. At present 15 men are employed. Two tunnels have been run, one being 1300 feet in length and the other 700 feet. In one of the tunnels the ledge was lost for several hundred feet. It was afterward found a little over 100 feet from the mouth of the tunnel. A large number of ledges situated in the vicinity of the Delhi have been located, and some of them are being prospected. Andrew Jones is the owner of the following ledges: The Tip-Top, the Champion, the Pennsylvania, the Live Oak, the Oriental, the Sea-bird, the Egyptian Queen and the Egyptian King. The first three are situated on the north bank of the Middle Yuba river; the rest on the south bank. Those on the north bank pitch west; those on the south, east. The average thickness of these ore-veins is three feet. The ledges are well defined, as the croppings can be traced to the bed of the river. The ore contains sulphurets and galena. Abraham Dalton and Frank Whaland have located a ledge a short distance west of the General Grant. They have named it the Americus. Englebright and Beckwith have located on the south bank of the river the extension of the Pennsylvania. If the General Grant turns out as well as the Delhi, all these ledges will probably be developed.

COE MINE.—Grass Valley Union, June 2: The buildings for the new pumping and hoisting works of the Coe mine are under cover, and the machinery is being put in. The machinery will be driven by water-power—an eight-foot Pelton wheel being used for hoisting, and a four-foot for pumping. Twenty inches of water will be used under a pressure of 220 feet, which will furnish the requisite power. There has been some delay in obtaining the wheels, as the foundry is pressed with the manufacture of these wheels, working night and day on orders that are to be filled, but it is expected that everything will be in readiness at the mine to commence pumping the water out of the shaft and levels in one week from this date.

WILL ERECT A MILL.—Transcript, June 5: Alf. Tregidgo has contracted for a ten-stamp mill to be put up on the Bluebell mine at Maybet, Washington township. The machinery has been on another mine in the same part of the county, and the re-

moval of it will begin at once. The ledge in the bottom of the shaft is 4½ feet thick, and of good quality. James Wells, who formerly worked at the Wyoming mine here, is foreman of the Bluebell.

Placer.

IOWA HILL.—Cor. Placer Herald, June 4: The Red Point boys report the upraise 100 feet, and work in the main tunnel being vigorously prosecuted. From the quartz mines reports are favorable, as also from Damascus. Quartz seems to be the rage here now. Messrs. Hobson, Hoffman, Drummond & Co. are building a boarding-house at their mine near Cottage Home, and in all probability before the summer is out we shall hear more of this mine. There is some talk of another large tunnel into the divide near Indian Springs. The Morning Star mill is hammering away; just what it pays is not known, but public opinion is that it pays well. Watts Bros. continue to keep their force of men at work with good results.

Plumas.

THE KETTLE MILL.—Greenville Bulletin, June 1: For some time past this property has been undergoing repair. The crushing capacity has been largely increased by a Pelton wheel and the completion of some needed repairs. A new 20-inch belt has been supplied. At present only 10 stamps are running on ore from the mine near by, owned by J. R. Drury, the lessee of the mill. The ore is of a brittle character and easily crushed. Only a few hands are necessary to keep the mill supplied with quartz. It is difficult to find a mine more easily and cheaply worked than this one.

THE CRESCENT.—The shaft is 200 feet deep, and is lined the entire depth, so that it is quite dry, comparatively speaking. The hoisting is done by water-power owned by the company. In the 200-foot level, a crosscut 50 feet to the south has been made to what has been known as the Pet vein. The ledge is about three feet wide, and it shows a small amount of gold, though no mill-test has yet been made to prove its value. Thus far, the crosscut to the north shows nothing but blue curly rock. In the Pet vein, on the 80-foot level, 240 feet from the new shaft, the company is mining a stope of ore which was left there years ago on account of a cave immediately south of the Pet, which cave cut off communication with the old shaft. The ore-body in the face of the drift is from three to six feet wide.

RICH PROSPECT.—National, June 4: Ted and Roy Whiting, who are at work on the old French ravine quartz ledge, struck a very rich stringer this week, which promises to be a valuable find. The ledge is owned by F. B. Whiting, of this place.

THE EDMAN MINE.—Some of our townsmen visited the Edman mine, on Eagle gulch, this week. The mill runs like clockwork, and everything about the mine has a permanent and prosperous look. It is a bonanza for the owners, Messrs. Edman & Mainlund.

Santa Barbara.

THE UPPER SISQUOC.—Cor. Lompoc Record, June 4: The mineral possibilities of the Upper Sisquoc are great; placer gold can be obtained in any place, even among the grass-roots in the loam, and as for cinnabar, the whole southern slope of the ridge between Santa Ynez and Sisquoc seems filled with it. In fact so great are the possibilities of the mineral resources of that section that it would justify the organization of a co-operative prospecting company to send experienced prospectors out and make an investigation. Our party brought in some fine specimens which will be assayed.

Sierra.

GOLD.—Mountain Messenger, June 4: The total cleanups of the Bald Mountain Extension Co. at Forest City for the past month are over \$13,500, and for April and May, \$25,500. Dividend No. 11, of ten cents a share, aggregating \$6000, was paid June 1st. A well-defined, rich gold lead is being followed, and under the able control of Supt. Meikle, the prospect is very favorable for the continuance of dividends. The Gold Bluff mine is all right now. The ledge has widened to 2½ feet, and is still growing wider. If anything, the rock is richer than it was in the tunnel above. The mill will be started in a short time.

PIKE CITY.—About the welfare and prosperity of our community—the Alaska company with its 40 stamps keeps hammering out the golden grain. The General Grant Co. has a force of men at work building their ro-stamp mill and developing the mine. Mr. Wilson, of the Red Ledge, on Kanaka creek, is making preparations for development. The Sunflower Co. extended their shaft over 70 feet crosscutted to the ledge, and through the same, it being about four feet through. Through inability to handle the water, the work was discontinued. The owners are expected up shortly, when steps will be taken to further prosecute the work; and probably are long our community will be enriched by several additional bullion-producing properties.

Trinity.

A NEW STRIKE.—Journal, June 4: J. T. Wey and has shown us some specimens of the richest quartz we have seen for a long time. The rock was taken from a new discovery recently made by him in the old Enterprise mine, owned by the Gibson Bros., which he has leased for a year. He discovered the vein on the 25th ult., and has been taking out rock from that date. The ledge is from one to three inches in thickness and promises to increase in width as it is run in on. The ore is very rich, and none has yet been taken out which does not show free gold and plenty of it. The new strike is about 100 feet west of the Little Gem.

BIG BONANZA.—Mr. Thomas Miller, of Minersville, informs us that work is progressing steadily on the Big Bonanza mine of that place. A shaft has been sunk 40 feet, at the bottom of which the ledge is from four to seven feet in width between well-defined walls, and consisting of vein matter, all of which prospects well. Mr. Todd, representing Oakland parties, was at the mine last week, and is negotiating for its purchase.

THE ENTERPRISE.—From Mr. Chas. Lobdell, who has just returned from a trip to East Fork to inspect the Enterprise mine, a three-fourths interest in which was recently purchased by him in company with Messrs. Balch & Leavitt, we learn that the mine is looking very well. Mr. Leavitt has charge of the mine and is working five men. The arastra is crushing a ton a day, and there is enough ore in sight to justify the purchase price. The new owners have struck the ledge in two new places,

and are consequently in good spirits. The purchase of the Enterprise also included the Lone Jack, which has a wide ledge of low-grade ore that prospects well. The rock from the ledge will not be crushed till the company has put up a mill, which will be done as soon as the development of the Enterprise justifies it.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—Enterprise, June 4: On the 1400 level west crosscut No. 1 from the south drift was extended 25 feet; total length, 126 feet. The north drift started from the bottom of winze No. 1 has been advanced 45 feet, passing through low-grade ore, in which are streaks and bunches of very good ore. Are still extracting ore from the new south stope which continue to look well. On the 1435 level still continue stoping out ore from around winze No. 2. South drift No. 2 from north line was advanced 35 feet, total length, 149 feet. It is still passing through ore, the average assays of which are low, but in which are streaks of fair ore. On the 1500 level, a west crosscut (No. 4) from the south drift was advanced 20 feet; total length, 34 feet. Are still pouring a steady stream of carbonic acid gas into the bulkheaded portion of the mine. The usual shipments of ore have been made to the river mills, and the pulp assays are about up to the usual average.

IOWA.—The mine is looking well, and the usual amount of ore is being extracted, with large quantities in sight. The mill has now been running steadily for three days and nights. Heretofore it was run only an hour or two at a time, on account of it being difficult to regulate the self-feeders, which are of a new pattern. These, with some alterations made, are now working very well. Outside of the batteries the silvered plates are already loaded with amalgam. This is a thing quite unexpected, as the batteries are so constructed as to hold most of the gold. They will, in a short time, begin to ship gold bullion below.

HALE AND NORCROSS.—On fifth station level the north drift has been advanced 22 feet, and is now 100 feet north from the main west drift. During the week they have started east and west crosscuts from the face of this drift. The main south drift on this level was extended 12 feet. The miners employed in this drift are now engaged in following some ore passed through back 60 feet from its face, which has a course nearly east and west. They have drifted on this ore 38 feet, and will continue to follow it, as it may lead to an important deposit. The car samples assay about \$40 a ton.

GOULD AND CURRY.—On the 300 level, at a point in the west crosscut 140 feet west from the upraise, a north drift was advanced 30 feet; total length, 76 feet. This drift is still in quartz of a good, lively appearance. On the 625 level the east crosscut from the main south drift was advanced 35 feet; total length, 343 feet. The face is in soft porphyry, showing clay slips. The winze was sunk 8 feet; total depth, 65 feet. From the bottom of this winze an east crosscut was advanced 20 feet; total length, 29 feet. The crosscut is in a mixture of quartz and clay that shows some metal.

SAVAGE.—On the 500 level are easing timbers and repairing drifts. On the 600 level the east crosscut from the fifth floor has been advanced 32 feet, and is now 77 feet long. The upraise in the quartz body on this level has been advanced 16 feet. On the 1200 level the west station from the main shaft has been repaired, and a drift started west from it. At the 1300 level are repairing the shaft station and easing timbers in the vertical shaft from this to the 1200 level.

HAYWOOD.—The ore body on the 200 level is constantly improving where drifted into, but there being great quantities of ore above, at and above the tunnel level, the greater part of the ore taken out for the milling comes from a depth of about 90 feet below the surface. They still lack milling facilities. They are steadily running the Thompson mill, but have on hand ore enough to run all the mills on Gold canyon, could they obtain them.

BALTIMORE.—The ore in the raise above the 300 level is looking well, and the quantity is still increasing. Good progress is being made in the drifts on the east and west sides of the vein, and both are showing a considerable amount of good ore. Milling ore is also being extracted on the 400 level. The vein on the 300 level is not less than 50 feet in width, all a solid body of quartz.

ALTA.—On the 800 level are running north and south along the vein in ore of a good quality. They have their dump and two large platforms filled with ore. At present, ore is not being hoisted except where it is absolutely necessary to bring it to the surface in order to get it out of the way. The north drift on this level (the 800) will be extended into Benton ground.

CHOLLAR.—The Sharon shaft and old Chollar shaft have not yet been connected by the drifts being run between them. The usual prospecting operations are in progress from the 1200 to the surface. They will probably resume operations on the 1300 level in a few days. They have there a fine body of ore which has never been fully explored.

LADY WASHINGTON.—The whole face of the drift going north on the 700 level is in good-milling ore. The ore was struck at a point about 24 feet north of the Benton line. A crosscut made on the deposit shows it to be 12 feet. At this distance north the ore may be still wider, but no crosscut has been made on it.

NORTH OCCIDENTAL.—Arrangements are being made below to work this mine through the Occidental. They will start in on the 400-tunnel level. It is said that milling ore can be obtained from that depth to the surface, and that the ore was better in the Occidental below the 400 level than above it.

MEXICAN AND UNION CON.—On the 1300 level the joint Union and Mexican drift running north-easterly was extended 30 feet. This drift is now 62 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 25 feet; total length, 508 feet.

UTAH.—On the 472 level the north drift from the main west drift was extended 25 feet; total length, 757 feet. The face still continues in vein porphyry, passing through clay-slips showing moisture.

CROWN POINT.—The usual quantity and quality of ore is being extracted for milling, and a good

deal of prospecting is being done. The 450 and 550 levels are being opened to explore the downward extension of the ore body exposed on the 350 level.

BULLION.—Good progress is making in the north drift on the 200 level. The drift east on the 300 level for the east vein is making good headway. The south drift on the west vein on this level is passing into quartz that begins to yield assays.

SIERRA NEVADA.—On the 520 level west crosscut No. 9, from the north lateral drift No. 2, 160 feet south from west crosscut No. 1, was extended 45 feet; total length, 432 feet. The face continues to a mixture of quartz, clay, and porphyry.

OCCIDENTAL.—On the 200 level are cutting out a station from the north incline winze 88 feet on the slope below the 100 level. In the lower tunnel upraise tunnel No. 2 was extended 20 feet; total length, 194 feet.

BEST AND BELCHER.—On the 800 level west crosscut No. 4 was extended 20 feet; total length, 467 feet. The face is in porphyry and quartz, showing value by assay.

ANDES.—The winze on the 240 level is down about 30 feet, and is still showing some ore. The upraise from this level (near the winze) is also in ore of a fair quality.

OPHIR.—On the 1300 level, north winze, No. 1, was sunk 10 feet; total depth, 45 feet. It is leaving the old stone timbers and shows low-grade ore at the bottom.

YELLOW JACKET.—All parts of the mine are looking well, and all the ore is being extracted for which milling facilities can be found.

BELCHER.—About 100 tons of ore are extracted daily. The Santiago mill, Carson river, is now to be run on ore from the mine.

KENTUCK.—The daily output of ore is about 50 tons. Most of this ore is crushed at the Rock Point mill, Dayton.

OEST.—Still extracting the usual amount of good milling ore.

Araba District.

ORE.—Cor. *Silver State*, June 3: Our mining interests are looming up a little. Geo. Lovelock is shipping ore from Arabia district to the Reno Reduction Works, which pays a small profit over the cost of extraction and shipping. Bernice has taken a new lease of life under the management of W. W. Williams, who has purchased the Bothwell mill and store at that place. A force of men has been put on the Golden Crown mine to take out ore in sufficient quantities to keep the mill constantly running. Last week's stage brought in two bars of bullion valued at \$2000, the result of four days' run of five stamps. Mr. Williams intends to increase the capacity of the mill by five stamps more, as there are other mines in the camp that will contribute sufficient ore to keep them running.

Eureka District.

ORE SHIPMENTS.—Eureka *Sentinel*, June 7: During the past week, ore shipments were made from the mines of the district to the Richmond works—Silver Lick, 30 tons; Lizzie L., 11 tons; Silver Connor, 101 tons; Jackson, 62 tons; Basye, 2 tons; Whipcorwill, 45 tons. To the Eureka Con. works—Reeves & Berry, 21½ tons; Dunderberg, 51½ tons; Morning Star, 2 tons; Kentuck, 1 ton.

Julian District.

EMMA.—Julian *Sentinel*, June 3: The Emma mine, between here and Banner, owned by John Ryan, is now being worked by Sanford & Sullivan.

THE BANNER MINES.—Julian *Sentinel*, June 3: Banner is booming. The Ready Relief is moving as usual. Fray, Brittingham & Woods are now pushing the work on their tunnel at the Hidden Treasure; when completed it will be 250 feet long, through hard rock. They deserve success. The Cincinnati Belle, owned by W. L. Fredrick, is looming up wonderfully rich. No doubt this is one of the best mines in the Julian district. The old Kentuck, now known as the Standard, is being sought after by outside mining men. Thousands of dollars have been extracted from this mine in times past.

Morey District.

AT WORK.—Belmont *Courier*, June 7: Work is prosecuted with the usual energy in the mines of Morey, in Eastern Nye.

Northumberland District.

SILVER ORE.—Belmont *Courier*, June 7: Messrs. Adams, Brewer and others are finding good silver ore in their mines.

San Antonio District.

PROSPECTING.—Belmont *Courier*, June 7: Asa B. Eastwood informs us that the work of prospecting goes bravely on in San Antonio mining district, Nye county. In some of the claims the ore carries gold; in others, the ore is rich in silver. An assay of ore from that district, made recently, gave as high as \$40 in gold to the ton. It is Mr. Eastwood's intention to prosecute the work of prospecting energetically the coming summer, and be as strong hopes of finding extensive and rich bodies of ore in that district.

Tuscarora District.

COMMONWEALTH.—Have broken ground for a 2½ compartment shaft, and sunk the same to the depth of 8 feet. Have commenced work in the northwest gangway of the Nevada Queen, which has reached our south end line. This will be extended to the shaft just started, and connection made at the depth of 300 feet. The present face of gangway is in very favorable looking porphyry, and the strata of high-grade ore, that are being cut, indicate the close proximity of a ledge.

DIANA.—The machinery is being put in good repair, and work will be resumed on the lower levels in a few days. Arrangements have been made to prospect the west side of the mine, by extending crosscuts east from the 150-foot level of North Belle Isle. The first crosscut will be started at once.

NORTH BELLE ISLE.—North gangway on the 400-foot level has entered better breaking ground; progress the past week, 20 feet. Work will be commenced next week on the foundation for a new hoisting plant.

BELLE ISLE.—The 150-foot level has been advanced a total distance of 157 feet. The formation is more favorable for ore. North drift from same has been extended 9 feet; total length, 145 feet.

NEVADA QUEEN.—Shaft has been sunk 14 feet,

and will be finished in two weeks. Northwest drift, 200-foot level, has been advanced 27 feet, and has reached south end line of Commonwealth mine. Formation is stratified with seams of high-grade ore.

NAVAJO.—*Times-Review*, June 3: No material change to note in any of the workings. Good progress has been made with the work at all points.

Union District.

AT IONE.—Esmeralda *News*, June 4: Ione is one of the oldest camps in Eastern Nevada; it was once the county seat of Nye and a booming camp. The richest kind of ore has been and may now be extracted from its mines. The mining district is known as Union, and extends from Gold Park south along the range to a point beyond Grantsville to what was formerly known as Milton canyon. There are large quantities of low-grade ore on the dumps of all the mines in the district, and if the Nevada Central railroad is ever extended south to connect with the C. & C. at Soda Springs, the whole section of country south of Austin, up Reese River valley, may be benefited. What is needed is immense reduction works with concentrators to economically reduce the ore. There is no section of country that presents the inducements and advantages of Union district. At a point on Reese river, below John Gooding's ranch, water can be had from the river to propel any amount of machinery, and the distance from there to the mines would not exceed four or five miles; with the country covered with the finest of nut pine timber. There is a grand opportunity for capitalists to take hold of property, which can be obtained at a reasonable price. There is no reason why the ore of Union district could not be reduced at a very low cost.

Wild Rose District.

SYSTEMATIC MINING.—*Silver State*, June 4: Lawyer Deal, of Virginia City, returned yesterday from Spring City. He says he never saw more systematic mining than that of the Paradise Valley mine, under the direction of Superintendent McCurdy. Everything runs like clock-work, and the drifts and tunnels are arranged so as to get ore and waste rock to the surface at the least possible cost.

PARADISE VALLEY.—*Silver State*, June 7: For week, milling ore delivered to the mill—Paradise mine, 75,830 pounds; Wild Goose mine, 28,400 pounds; total, 52 tons, 230 pounds. Average assay value per ton, 27.40 oz. silver; 0.14 oz. gold. Mill run 190 hours and reduced 80 tons of ore and 64 tons of tailings. Concentrates produced, 426 sacks, 33,032 pounds, par value, \$5378.74. About 110 feet from present face of the Wild Goose drift we cut a seam, some four or five inches wide, carrying some water, a little quartz and considerable iron, which may possibly prove to be the ledge at a point where it is pinched. The stoop on the upper level of the Wild Goose shows some improvement as we raise and go north; now have some eight feet of fair milling ore.

Willow Creek District.

ARASTRAS RUNNING.—*Silver State*, June 1: Sam Heintzleman returned yesterday from a trip to the Willow Creek mines. He says there are several arastras running there, and the Choate boys seem to be doing well. He did not have time to make a thorough examination of the mines, but as far as he was able to observe they look promising.

ALASKA.

BULLION.—*Alaskan*, May 25: The shipment of gold bullion from the Paris mine, Douglas island, by the last mail steamer was by far the largest yet made—eight bars, said to be of the value of \$20,000 each.

SILVER BAY.—Things are likely to boom in the Silver Bay district henceforward, dependent only on the result of investigations already in progress and soon to follow. While in the East, Mr. Haly made conditional sale of what is known as the Haly and Rogers lode, and his Free Gold Ledge, to strong parties. One of these syndicates is represented by Mr. L. Q. Olcott, who came up on the Ancon and lost no time in setting men to work in unwatering the shaft on the first-named property. It is the intention of Mr. Olcott, in accordance with his instructions, to take average samples of the vein-rock from every part of the shaft, which is down 50 feet in the ledge, and take it to San Francisco for a practical test, upon the result of which will depend the question of future operations. Should the test prove satisfactory, mining operations will be commenced and pushed with vigor and without delay. In the other case the parties have until the first of July in which to investigate and decide whether they will close the trade finally, and their representative may be expected here some time next month. The erection of mills on both these claims will speedily follow a satisfactory conclusion of the pending examination and tests. It is also understood that Capt. P. T. Tracy, who has an option for the purchase of the Mooney ledge near the head of Silver bay, and nearly opposite the landing, has concluded arrangements which will result in a thorough examination of that property, together with a practical test of the rock. Altogether, it looks as if the coming summer would be one of unusual activity at and around Silver bay. That the work to be done will result in proving beyond all question the very great value of at least some of the ledges, scarcely admits of a single doubt.

ARIZONA.

PACKING ORE.—Prescott *Courier*, June 6: Messrs. Riggs & Lawler have engaged a 30-animal pack train to transport ore from the mine to Prescott. It is said that their ore will yield over \$200 a ton, mostly gold. W. T. Richardson, just from Alexandra, tells us that the new pump is in place and hoisting water. He has 12 men at work, and expects to have the mine dried in 10 or 12 days. Martin Maier, who has just returned from the mountains, says he passed 12 large teams, hauling machinery to Diamond Jo and other camps; saw a great many miners at work, and is confident of much better times here and hereabouts. Humburg district people tell of chlorides who are making plenty of money. They have shipped over \$200,000 worth of silver ore the past year. The best news yet is, that the Prescott sampling works will make their first run to-day. Steam was started Saturday last, and everything worked well.

TOMBSTONE.—*Democrat*, June 6: The T. M. & M. Co. has put a force of men on the Lucky Cuss

and Wedge, taking out manganese ore for flux at the Charleston smelter. At the West Side they are busy putting in the new eight-inch pump, which will be completed in about two weeks, when the company will start up their mill. The Grand Central shaft is now down 100 feet. The Grand Dipper shaft is down to the 300, and work on the drift to connect with the Grand Central has been commenced. At the Rattlesnake, development work on the 400 still continues, and the drift is in about 45 feet. The winze from the 300 is down 100 feet, all in ore. The Emerald still ships her usual quota of ore.

IDAHO.

EAGLE CITY AND VICINITY.—*Cœur d'Alene Record*, June 1: About 50 persons spent the winter at Eagle. At the head of East and West Eagle creeks and their tributaries the snow yet lies quite deep. The warm weather melting the winter's snows keeps the streams continually bank-full, making travel by horseback impossible. Frank and Henry Whittle are working on their leads about Doctorville, on West Eagle. Quite a number of men are placer mining on East Eagle near the mouth of Tributary gulch. The gold found here is the finest produced in Cœur d'Alene. The summit of Old Baldy is still snow-capped, yet many have started in to work their quartz leads. Supplies are packed up the trail along the hog-back or point of the mountain. Robinson Bros., in Fancy gulch, have 1400 feet of bedrock flume in place, but are hampered on account of the lack of water, they having to reservoir to get a supply for part of the day. Below town, on main Eagle, McGuire & Co. are making wages ground-slucing on the north rim of the creek.

MONTANA.

GEORGETOWN AND PHILIPSBURG.—*Inter-Mountain*, June 3: R. B. Wallace returned last night from the mining district about Georgetown and Philipsburg. He says the snow is going off rapidly, and the water is so high as to be a serious inconvenience. The Pyrenes mill is running all the time. The mine is looking well, but there is considerable water in the lower levels. Sufficient ore is being taken out between the 100 and 200-foot levels to run the mill. Everything at Philipsburg is looking well. The Hope is running on a fine body of ore. The Granite Mountain is as busy as ever. There is great fear that a shut-down of the mill will be necessary on account of a lack of salt. The Granite Mountain gets its supply of salt from Michigan, over the Northern Pacific, and consumes eight tons per day. There is at present only one carload of salt west of the Mullan tunnel, and there is no supply on hand at Philipsburg.

ANACONDA.—*Review*, June 4: The Anaconda Company is pushing forward the work at the new concentrator. There are 175 men engaged in placing machinery in position, or mason work, and in the framing yard. The masons are at work putting in the rock foundation and brickwork for the new boilers; three double sets of steel, which is to furnish the steam-power for the new 1000-horse power, which is to be placed in the power building. This engine will be the largest one west of the Missouri river, and will furnish what power is needed after an 800-horse power is utilized. At the main concentrator building, which is 320 feet in length, a portion of the shafting has been put in, and the vats, pans, and settlers are already in position. There are 18 settlers and 36 pans, which are to be fed from the 60-stamp mill immediately above. The batteries are in position and nearly all the machinery. Just above these stamps will be placed three steam stamps which will handle 500 tons of ore per day, and just above the steam stamps is the ore-house which is reached by the railway, and into which will be dumped the ore. It is expected that the works will be completed and ready for operation by September 1st, and when they commence it will take 2000 tons of ore per day to run both the upper and lower works. There are many people who do not believe that there is ore enough in Butte to keep this mammoth smelter going a great while. It is simply a question of mathematics. Conservative experts state that there is ore enough right in sight in ore property of this company's to furnish 2000 tons daily for 18 years.

HIGHLAND.—Butte *Miner*, June 1: E. F. Dunckel arrived last evening from the Highland gold and silver district. He reports the snow as deep yet and very little work being done upon the mines. Mr. Dunckel brought in several pieces of rock from his own mine, which assays from \$250 to \$400 per ton. Dunckel will soon have a large force of men employed to develop his valuable location the coming season. The prospects are flattering. Indications of a rush to the new diggings are decidedly strong. J. T. Robbins, late foreman of the Montana Copper Co., has just returned from Argentina, Beaverhead county. He informs us that the Tuscarora has one shaft down 40 feet on a bed of ore, with good walls. The claim is 400 feet in length by 120 feet in width, and has been prospected thoroughly. The ore body shows up for nearly the entire length and width of the claim. It goes well in silver, lead and carbonates generally. Stopping is being done on the first and second levels of the Elm Orlu, and between 50 and 60 tons are produced every 24 hours. Forty men work about the mine. The shaft is going down to the 300 steadily. The ore in the mine averages about \$30 a ton. Great praise can be freely accorded the management of this mine, it having been opened only two years ago, and has paid from grass roots down to its present depth. John Nugent is the superintendent of these works.

NEW MEXICO.

CARLISLE.—Clifton *Clarion*, June 2: This excellent mining property has changed hands, having been purchased by a foreign corporation, and is now known as the Carlisle Gold Mining Co., limited, with headquarters in London, England. The price paid is said to be \$500,000. Mr. J. Longmaid is the superintendent for the new company, succeeding Mr. D. B. Huntly, who, he is said to his credit, was the first to make the property a paying investment. Mr. Longmaid, in his management, is following closely in the footsteps of his predecessor, and no doubt, like him, will make a success. He is ably assisted by his son, who has the management

of the mill, which now consists of 40 stamps, but the ground is now being prepared for 40 more. The main shaft of the mine is down some 400 feet, but preparations are being made to sink 200 feet further. Drifts are run every 100 feet, and if reports are to be believed, each and every one of them is in ore, low grade, it is true, but which it will pay well to work. There are many other excellent prospects in this section, and it is only a question of time before they are fully developed.

BONITO BULLION.—Rio Grande *Republican*, June 4: The Bismarck mine pans away up. Mr. Danner is running two arastras on Hopeful ore with good results. Minor Gaylord took out in a 44-hours' run on Hopeful ore with a rocker, \$75. Theo. McKelley is developing the Maud Muller. It is a panning prospect and is looking well. Hamilton Bros. are working the Hoosier Slide and Little Buck Shot. They both show gold in the pan. Development on the Hopeful still proceeds. Shaft No. 2 is down 60 feet, and all in ore. The ore taken out more than pays for sinking. Parsons has let a contract for 100 feet of tunneling on the Hopeful. The ore that comes out doubly pays for the work. The tunnel face at the base of the hill, on the Hopeful, shows free gold, and it is also found in the bottom of shaft No. 2, at a depth of 60 feet. Banner & Wingfield have discovered free gold in a new mine. It is called the Dead Oak. They have timbered and are sinking.

PALOMAS.—Socorro *Bullion*, June 4: The camp at Hermosa has become one of the steady producers of New Mexico, and the ore output increasing. Like most other mining districts in the territory, the best properties are owned by men of limited means, who not being able to push developments, are forced to do most work, and often all, themselves, and under the disadvantages of not having everything at hand necessary to the speedy development of their claims, still they are pushing work on and gradually coming to the front in a way that is sure to receive its just reward. Probably one of the most promising is the Eagle group, owned by Day, Miner & Kendall, and others, which is now producing and shipping to Socorro. The ore is argilliferous galena, running high in silver, and shows a good body in a well-defined line fissure. The working shaft is 65 feet deep, and the owners are sinking on ore. This group of mines is recognized as among the best appearing properties in the range.

WHITE OAK.—*Interpreter*, June 4: The Hannibal group of mines, composed of the Hannibal lode and Hannibal No. 2, have been surveyed for patent by W. F. Blanchard, U. S. D. M. S. These prospects have had little more than assessment work done on them for several years, yet they have produced some of the richest ore in the camp. The seams in these properties are more or less broken and faulted, and like most mines require some expenditure to open up the ore bodies, but they will amply justify the owners in making the required expenditure for their thorough development. This has been the case with all the locations in White Oaks which prospecting at all at the grass roots.

OREGON.

QUARTZ AND PLACERS.—Jacksonville *Times*, June 3: Operations continue at Cornelius & Co.'s quartz-mill and the Swinden ledge with the best results. Smith & Lynch, of the Wagner creek placer mines, have ceased piling for the season. They will be engaged in cleaning up for several months. August Brentano has purchased the Hope ledge on Wagner creek of J. W. Walsh and Geo. M. Willard, and will commence prospecting it on an extensive scale before long. The price paid was \$1250. Piping is now going on at Ennis & Cameron's diggings in Galice creek district, with excellent results. These gentlemen are well pleased with the work which has been done there this season, which speaks well for their mines. Parke & Lacy, of Portland, the leading dealers in mining machinery of all kinds on the coast, will soon open a branch depot at Spokane Falls, W. T. Theo. Cameron and Frank Ennis, who are interested with Geo. Simmons in a gigantic mining enterprise near Waldo, Josephine county, paid that section a visit last week. They speak well of their investment, but say that it will be some time yet before it will yield returns, as they may not be ready even next season to commence active operations in paying ground.

NEW DISCOVERY.—Rogue River *Courier*, June 3: The quartz ledge discovered on the hills southeast of town a few days ago by Messrs. Sterling (a mining expert) and Strickler has turned out to be immensely rich. Mr. Sterling had some of the ore assayed by Mr. Keenan, who informs us that it went over \$60 to the ton. Mr. Keenan says the rock is the best he has ever seen around Grant's Pass.

UTAH.

ROADS.—Park *Record*, June 4: The roads to Snake Creek district's ore dumps will soon be open, and among the several companies that intend to ship is the Southern Tier or Hayt property. A big dump of high-grade ore, and lots of it will go way up into the thousands, will soon be moved to market.

APEX.—Park *Record*, June 4: Chas. Read, superintendent of the Apex, came up from Salt Lake and inspected operations at the Apex. It was learned from a reliable source yesterday that over 50 tons of first-class ore was on the dump ready for shipment. It was also learned that by the 15th inst. Apex shipments would be in full blast. Everything at the mine is in ship-shape, and 10 tons of rich ore can be produced daily.

CAMP CROSSCUTS.—The Ontario mill will soon be closed down for a thorough overhauling and repairing. The mill has made a steady and successful run the past year. When closed down two brick furnaces will be built. The Crescent Co. has contracted to sell this year's output of ore and concentrates to the Hanauer smelter. Heretofore the Crescent product was sold in Denver. Discoveries of gold-bearing quartz have been made about five miles up Parley's canyon. Expert Gregg, formerly of the Park, predicts a gold excitement down there. Prospectors and claim developers are making it lively in the hills. The new hoisting machinery for the Daly, and also for the Crescent, is being put in place with all possible speed. The Boss made an initial shipment this week. Park City's ore shipments were heavier the last two months than for any like period during the camp's existence.

—IMPROVED—
James Patent Economic Quartz Mill,
ROCK BREAKER
—AND—
AUTOMATIC ORE FEEDER.

This Machine is now Superior to any, not excepting the Stamp Mill.

DOUBLE and TRIPLE MILLS,
 With Two or Three Rockers in One Mortar.

ORE CRUSHER.

View of Pulverizer.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the materials are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

PNEUMATIC PULVERIZER COMPANY,

2 and 4 Stone Street, NEW YORK.

H.H.H. HORSE LINIMENT.
 FOR MAN OR HORSE
 D.D.T. 1866.
 THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all druggists.

RUPTURE
 Quickly and Permanently Cured by the Celebrated DR. PIERCE'S MAGNETIC ELASTIC TRUSS. Original and ONLY GENUINE Electric Truss. Perfect Retainer. Easy to wear. Instantly relieves every case. Has cured thousands. Estab. 1856. Send for Free Illustrated Pamphlet No. 1. **MAGNETIC ELASTIC TRUSS CO.,** 304 NORTH SIXTH STREET, ST. LOUIS, MO. 704 SACRAMENTO ST., SAN FRANCISCO, CAL.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PROCESS OF CANNING.—D. E. Ashby, S. F., No. 363,941. Dated May 31, 1887. This invention relates to a process for cooking substances in jars or cans in which they are to be hermetically sealed, and it is especially applicable to the cooking of such substances in glass jars in such a manner that the glass packages will not be broken by rapid heating and cooling. In this invention the jar is gradually exposed to the conductive power of the heat of the containing vessel and the thin surrounding envelope of water within it, and all danger of breakage from this cause is averted.

TRACTION ENGINE.—Jacob Price, San Leandro. No. 363,966. Dated May 31, 1887. This traction engine is especially for use on ordinary roadways or fields. It consists of an engine and boiler mounted on suitable bearings and traction wheels and an interminably oscillating clutch mechanism of peculiar construction, by which the reciprocating motion of the engine is transmitted to the driving wheels, so as to produce a continuous rotary motion of the same without the intervention of gearing; and it also consists in a means for adjusting the transmitted stroke and the consequent power which is applied to the engine.

ADDING MACHINE.—Brainard F. Smith, Sacramento, and Arthur E. Shattuck, of San Francisco. No. 363,972. Dated May 31, 1887. This invention relates to that class of adding machines in which the independent wheels, having upon their peripheries different digit and multiples of said digit, are separately actuated by means of levers, and the invention consists in the combination of the spring-actuating wheels, the pivoted keys, and the ratchet and escapement-pawl mechanism. The object of the invention is to reduce a long column of figures to a short one.

CARTRIDGE CRIMPER.—John A. Haas, Port Costa. No. 363,955. Dated May 31, 1887. In the mechanical devices for loading paste-board cartridges for shotguns, after the powder, shot and wads are in their respective positions, it is necessary to crimp the edge of the cartridge smoothly, that the contents may be held firmly in position. This is generally done by a crimping attachment which consists of a piece of metal suitably formed to press on the edge of shell with a solid projecting center which rests on the upper wad. By reason of the varying thicknesses of wads, the form of crimper generally in use is far from satisfactory, as sometimes it breaks down the edge of the shell or causes the shell to bulge out at the center and makes an enlargement there. The solid pieces wear out very rapidly and have to be constantly changed. At each variation of charge the crimper must be changed to suit the new conditions. The new crimper covered by this patent removes all these objections. It has a movable and self-adjusting center and a removable and interchangeable crimping portion. By its construction full or light wads in the cartridges will make no difference in the smoothness and uniformity of the crimping. Varying loads may be treated without changing the crimper. The removable crimping flange may be taken out and changed whenever worn. This crimping device has been attached to the Chamberlain cartridge-loading machine in use by the Selby Smelting and Lead Company, and works very satisfactorily.

Mining Share Market.

There has not been much activity in mining stocks during the past week. What fluctuations occur are by no means large. Concerning the Comstock mining situation, the *Enterprise* says: "In the mines it has been many years since there has been so much ore in sight. They have it all along the Comstock from the north end mines down to Silver City—have stacks of it. In the Chollar, Potosi, Alta, Justice, and several other mines, the drifts and other openings in the lower levels are stowed full of ore. In other mines where the work of extraction and shipment is in progress, they have great quantities of ore opened up and in sight. When all begin to hoist and mill their ores the old Comstock will hum; there will be a bigger output of bullion than has been seen for many years. The stone foundation walls at the new water-mill, near the Chollar shaft, are being rapidly laid up. All activity there, not only among the stone-masons, but also among the carpenters and millwrights. At the California stamp-mill and also at the big pan-mill preparations are being made for the driving of the machinery by water-power."

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Delhi, June 4, \$21,200; Con. California and Virginia, 4, \$72,980; Germania, 1, \$23,433; Hanauer, 1, \$9750; Bannock, 1, \$1400; Hanauer, 3, \$4950; Germania, 5, \$3800; Hanauer, 5, \$2400; Bald Mountain (for May), \$13,500; Margat Ann, 1, \$3572; Silver Bow, 1, \$29,280; Lapanta, 1, \$3500; Eureka, 2, \$5250; Alice, 1, \$32,128; Moulton, 1, \$16,144; Bluebird, 1, \$20,416; Daly, 4, \$63,329. Ore receipts at Salt Lake last week, \$42,300, by Wells, Fargo & Co.; \$26,750 by McCormick & Co., including \$4700 Crescent; \$14,079.52 by T. R. Jones & Co.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court Department to, San Francisco:

KNICKERBOCKER CON. M. CO., June 4. Capital stock, \$10,000,000. Directors, F. W. Sharon, W. E. Sharon, R. N. Graves, J. P. Martin and W. S. Wood.
 TREASURE-BOX M. CO., June 4. Capital stock, \$1,000,000. Directors, O. C. Hewitt, J. M. Bryan, F. A. Smith, C. H. Hubbard and J. O. Coleman.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

To Mining Men.

FOR SALE AT A BARGAIN—A new 30 to 60 H. P. Engine, with governor, pump and heater, new and complete, \$425 cash, F. G. B. in S. F. Two Triumph Concentrators in perfect order and almost new, \$800 each, F. G. B. in S. F. Apply to A. P. WHITEHEAD, 908 Market St., San Francisco.

Our Agents.

GUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.
 JARROD C. HOAG—California.
 G. W. INGLE—Arizona.
 GEO. McDOWELL—Ventura and Santa Barbara Cos.
 R. L. DOYLE—Marin and Sonoma Cos.
 W. J. FREEMAN—California and Nevada.
 SHARPS FRANK—Colusa Co.
 WILLIAM POOL—Fresno Co.
 M. S. PRIME—Alameda Co.
 R. G. HUSTON—Butte, Montana.
 E. P. SMITH—Humboldt Co.
 S. J. LITTLEFIELD—San Diego Co.
 EDMUND WRIGHT—Shasta and Tehama Cos.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

PATENT
LIFE-SAVING RESPIRATOR
Entirely Prevents Lead Poisoning
and Salivation.

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.
In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.
The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

**THE FRISBEE-LUCOP MILL,****A CENTRIFUGAL ROLLER MILL**

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.
At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.
All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.
Certificates as to performance of the Mills, and any information required, furnished on application.

THE FRISBEE-LUCOP MILL CO.,

Office, 145 Broadway, cor. Liberty St., NEW YORK.

HOOKER & LAWRENCE, Gen'l Agents.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

—MANUFACTURER OF—

BATTERY SCREENS AND WIRE CLOTH

Agent for HOSKINS'

HYDRO-CARBON ASSAY FURNACES

BROCK'S PATENT DROP FORGED CHAIN PIPE WRENCH

MADE ENTIRELY OF BAR STEEL. Six Sizes; adapted for Pipe from 1 to 14 inches diameter.

Each number will fit a range of sizes equal to six or more pairs of common tools, while it will outwear an equal number of any kind.

All parts are interchangeable, and can be readily renewed.

Jaws are hardened to a saw temper, and can be sharpened with a file.

Does not crush pipe; has a quick grip; never slips; chain will not unbite while in use, but can be instantly released.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearings, coars or pulleys.

Power applied direct. Works Ore at Low Cost
More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

WM. GUTENBERGER.

Manufacture of Sulphuric Acid.

Description of an Improved Apparatus.

Large quantities of sulphuric acid are made in California, and used all over the coast. It is interesting to note the various experiments and changes in apparatus, made use of during the struggle for supremacy among the alkali manufacturers of Europe. We are indebted to them for perfected chemical plants of all descriptions, and in connection with the manufacture of acids, we are indebted deeply for their utilization of sulphur in ores, with consequent increase in mining industries and material lowering of price of brimstone. The production of sulphuric acid was their fundamental process; and active competition in trade, together with the passage of laws to compel the saving of gases, or to render them less destructive when issuing from chimneys, brought into use apparatus for the absorption of nitrogen compounds.

At a recent meeting of the American Institute of Mining Engineers, W. H. Adams, M. E. of New York, read a paper on "An Improvement in Apparatus for the Manufacture of Sulphuric Acid," in which he describes the Gay-Lussac absorbing tower for nitrous gases, the Glover tower for denitrating nitrous vitriol, and suggests certain plans and modifications himself. This paper is of great interest to acid manufacturers, and we here reproduce it in part with the necessary engravings.

The Gay-Lussac Absorbing Tower for Nitrous Gas.

This was the outcome of experimenting in the direction just named, and has not been modified or changed materially up to the present day. "It consists

of a chamber at the end of a set of chambers, higher than wide (a 'tower' or 'column'), the walls being made of material capable of resisting sulphuric acid, and the interior space filled with a material presenting a large surface. By means of this 'packing' a stream of sulphuric acid entering the column from above is divided into small drops; at the same time the current of gas rising up in the tower is divided into many small jets; thus the contact between the gas and the acid covering the surface of the packing is multiplied.

"The principle employed here is exactly the same as had been employed for a long time in the 'scrubbers' of gas works, and is also applied to the condensation of muriatic acid in the decomposition of common salt, namely, to produce a great many points of contact between

and lined in a careful manner with bricks or tiles, which conform to and hold the lead in shape and place.

The interior space is filled closely to the brick lining with acid-resisting materials, or "packing," so placed that it divides the vitriol,

ties as will cool the incoming burner gases to the proper temperature for maximum chamber-working. These acids give up the major part of the water they may contain, and during such concentration also give up any nitrous compounds they may contain, which, with the sulphurous gas, steam, etc., pass into the chambers.

The concentrated acid (59°-60° Baume) overflows from the pan bottom, is cooled, stored and utilized for any of the ordinary purposes.

Theoretically, the working of the Glover tower and Gay-Lussac column in combination gives us the first rational process for the economical manufacture of sulphuric acid in a large way, and it may be said that neither principle of working is valuable without the other, nor can any works be said to be properly constructed without employing the principles of both.

Practically, however, the Glover tower has not been successful, except, as stated, in the larger and better works, where managers are employed whose skill commands success. In fact, the majority of works in this country employ neither the Gay-Lussac column nor its companion, the Glover tower, and such works are fast being relegated to the rear of the procession.

It is a matter of surprise that such valuable parts of a large process should be lacking at this late day. The principal difficulty encountered by those who have erected the Glover tower seems to have been the lack of an acid-resisting material to line the interior, a material which will withstand disintegration in contact with hot concentrated acids.

After expenditures of large sums of money during the past 20 years, in the trial of every known substance, nothing

has been found to answer all the requirements.

Until this year it may be said that no material or method of lining towers has given promise of withstanding the usual deterioration, and therefore the full measure of value and great utility of the Glover tower has not as yet been realized.

The question has often arisen as to the possibility of adopting other forms of plant and modifications in construction to accomplish the same

(Continued on page 397.)

the gas and the absorbing agent. Or, the interior of the tower may be represented as a filter which allows only the inert gas to pass, but retains the gas acted upon by the absorbing agent."

The working of the tower consists in raising

entering at the top, into small streams or drops, thus presenting the greatest possible surface to the ascending hot gases from the burners.

The exterior is attached to and supported

other, nor can any works be said to be properly constructed without employing the principles of both.

Practically, however, the Glover tower has not been successful, except, as stated, in the larger and better works, where managers are employed whose skill commands success. In fact, the majority of works in this country employ neither the Gay-Lussac column nor its companion, the Glover tower, and such works are fast being relegated to the rear of the procession.

sufficient quantities of cooled acid (density 60°-62° Baume) to storage tanks above the level of the top, whence it is regularly fed into the interior, absorbing various nitrogen compounds, and the resulting nitrous vitriol runs off at the base into proper storage tanks for use in the Glover tower.

The Glover Tower for Denitrating Nitrous Vitriol.

This consists of a chamber at the beginning of a set of chambers, higher than wide (a "tower"), having an outer casing of sheet-lead

by strong framework resting upon a solid base of masonry and securely placed to prevent settling. The base is usually at about the level of the chamber bottom, from 10 to 15 feet above the level of the ground, but should always be high enough to drain its pan acid into the first chamber.

The working of the tower consists in raising sufficient quantities of acids, from any source or of any density, into storage-tanks above the top of the tower, and in feeding them into the interior in such a manner and in such quanti-

CORRESPONDENCE.

The Cœur d'Alene Mines.

(Concluded from our last.)

(From our Correspondent, R. G. HUSTON.)

Murray I found but little changed from what it was when I was here in October, 1885. There is not now so much of the loose-floating population as was the case then; but as these people are not often producers, the sooner a camp gives them the shake the better it is for all concerned. If a man does not produce anything in a new mining camp, he is a leech on the generosity of his friends, and if he has none of them, he has to get his living from anybody he can.

The placer mines, the origin of the Cœur d'Alene excitement of the winter of '83 and '84, On Pritchard Creek,

Were never of the magnitude reported on the start. But who ever knew of a camp that did come up to the wild visions of the persistent stamper who always has his blankets rolled, ready to take the hurricane deck of his cayuse and strike for a trail to new diggings. His happiness consists usually in the anticipation, as, when he arrives in the vicinity, he many times pronounces judgment on the country before he alights from his horse.

But Pritchard creek in the main bed has, with few exceptions, never paid much, most of the pay being in side gulches and bars. There is a very heavy deposit running through the high bare back of town and crossing all the different side gulches that put into Pritchard from the north side. They call this the Old Wash. The general opinion is that it is an old river-bed. This is the most extensive deposit of that character in the country, also the richest. The only reason that it is not at the present time producing a large amount of the precious is the lack of water to work it.

There is a ditch started from the main creek by some parties who have fallen by the wayside for want of capital, and, of course, they still hold their right to the water, until some one with money gets in and buys them out, or else furnishes capital to finish the ditch. This part of Murray's substantial support will remain *in statu quo*. There is a ditch which covers the lower part of the bar, and whenever they do have water have good pay. W. J. Hawkins is now operating his claim, and is taking out good money.

The Old Bedrock Flume Pool.

A bubble that was flying so high when I was here before, has been defunct for a long time. The Colorado and Eastern capital behind it failed to "ante" enough funds to start it in proper shape, and, as a matter of course, it had to succumb. Many of the local residents think it will be resurrected and made a success in time. However, with all the disappointments this camp has, I think there is a bright future for it yet. The development may be slow, but it surely will come. One quartz-mill, the old Golden Chest, has been running almost constantly since they first started. When I was in, it had just shut down to make some needed repairs, but will soon be at work again.

The Idaho Mill

Property will soon be at work again. They have expended over \$230,000 already on mine and improvements. The president of the company was on his way in to the works when I was coming out, and on his decision will depend the future of this property. If he decides to go to work in about 60 days, they can be dropping stamps. The Golden King mill, down below Murray, is in working order, but through a change in management is now shut down.

History repeats itself in regard to new mining camps and

Inexperienced Eastern Companies.

They buy a prospect and without developing the fact whether they have a mine or not, go to work and invest a large sum of money in a milling plant, which, in the first place, they do not know to a moral certainty they want. In the second place they invariably try to make themselves believe that their ore is free milling. This is to save some further expense, and the chances are strong that in nine cases out of ten they are here pursuing the "penny-wise plan," as the majority of the ores in the vicinity will require roasting to save a fair percentage of their value.

The Mother Lode

Owners are now operating their mine with an arrastra and are getting good returns for their work. The ore runs from \$50 to \$80 per ton. Although they do not work it very fast, their expense account is small and they are making money.

This is the property that created quite an excitement at the time of the discovery, when they uncovered a slab of almost fabulous richness. This, the company still preserve intact, but at the time of my visit it was under water, as the waters in the creek were very high.

A little way further up the mountain is the Occident and the Treasure Box. The latter has made quite a record this winter, the owners

having pounded out with a band mortar over \$15,000. They took out \$32,000 from one set of six-foot timbers. This, of course, was extra choice. Their ordinary ore runs through an arrastra averages from \$60 to \$75 per ton. This property is owned by the Williams Bros., Frank Chase and Anson Holmes. This season's work will, no doubt, give the boys a good home-stake and develop their property to its legitimate value.

The Occident is located between the Mother and Treasure Box. They also have an arrastra and are getting good results from what ore they work. The mine is owned by Stevens Bros., Tinker, Joe Taylor and McAnter.

The Buckeye Boy is below Murray about one and a half miles, in Dream gulch. It is owned by Frank Reed and Messrs. Scowden & Sheppard, of Louisville. A large amount of development work has here been done, and ore is in sight all around, although the development is not done in the shape to admit of an expert measuring up ore satisfactorily. There is plenty of ore in sight, and what has been worked in an arrastra down on Pritchard creek run \$32 per ton. The tailings from it assayed so high to the ton that it was a waste of good material to do much more in that line. Frank will be able one of these days to attract some capitalist to his mine and make a sale, and when he does look out for another heavy yielding gold mine. There is a

Number of Fine Prospects

On the old Belknap trail. These carry a heavy percentage of lead and a fair amount of silver. One of these, the Cresue, is about 10 miles from Murray, and is owned by H. L. Frank, of Butte, J. K. Waite, W. L. Blossom and J. S. Bennington. They have 720 feet of tunnels run at four different points on the vein. Samples run from 50 to 70 per cent lead and 15 to 500 ounces of silver per ton. These parties were about letting another contract for running another 100 feet of tunnel, and with their present showing will no doubt then build a road to the N. P. R. R., as they are only eight miles from it. That will at once give them access to reduction works, and then they can soon ascertain what the value of their property is. There are many other properties that have more or less work done on, according to ability of the holders, and many of them will prove to be good when they have acquired facilities for handling the ores properly.

At Murray.

Murray's business men are all in good spirits and are all carrying fair stocks of goods and speak with the utmost confidence of the future of their town. They have two good hotels—the Palace, kept by H. McCorkindale, the Louisville by Bennington & Darling—and the usual number of restaurants and saloons. The Cœur d'Alene *Sun*, owned by Adam Aulbach, an old San Franciscan, is a sprightly little daily, and with our old-time theatrical manager, Jack Langrishe, in the editorial chair, the *Sun* can never lack for news. The Cœur d'Alene *Record* is a tri-weekly, and is a creditable sheet for a new country. The paper is fully alive to the interests of the region and will see that they are properly laid before the public. From Murray to Thompson Falls it is 30 miles, and the fact that it has been giving us a warm rain every day for a week and ten feet of snow on the range to cross makes it quite a pleasant trip in anticipation. However, we made it through, although our bridge was washed away and we had to leave the coach and take to the hills horseback. This, without saddles, made the trip a funny one; but to use the jargon of this country, "we got there, Eli," late in the evening and tired out.

Thompson Falls

Is the main shipping point for Murray, and no doubt will be for some time to come. The town has quite a pleasant location just above the falls of that name on Clark's Fork of the Columbia. They were just having a meeting in regard to building trails into the new discoveries on Libby creek, a tributary of the Kootenai river. The mines here are found in a basin and bid fair to be extensive, but as far as I could learn not very rich, probably from \$2.50 to \$4 diggings. They are about 60 miles from Thompson Falls, and by building roads the merchants here can of course reduce the travel to come this way, all of which is of course very desirable to a point as dependent on outside supplies as Thompson.

They have also hopes of becoming quite a mining center, as the

Bell Mining Company

Is now operating with some 10 or 12 men on the Bell mine. This company was incorporated last year, but soon after that they were engaged in litigation, the circumstances of which I do not know, but this much I do know: it has retarded the development of the mine for some length of time.

They have shipped several carloads of ore from this mine, and the results have been very satisfactory, leaving a margin to the carload of from \$400 to \$700. This, with a quantity of ore and the convenience they have for shipping, as they are only five miles from the railroad up Thompson river, and no mountain to climb, makes it very easy to transport. Most of the Bell stock is held in Missoula by men of means. They are now operating with a view of systematically opening the property, and everything indicates that in the near future we will hear favorably from the Bell company of Thompson Falls.

Southern California.

[NO. 4.—CONTINUED.]

Editorial Correspondence.]

In continuing our notes upon Southern California, we now come to the extreme eastern portion of the great San Bernardino valley. At this point, and at an altitude of from 1600 to 1800 feet above the sea level, we find a plateau of some 10 or 12 square miles, which, for beauty of location and surroundings, fertility of soil, excellence of climate, facilities for irrigation, etc., cannot be excelled by any other locality in California. There are three centers of settlement near the central portion of this area, so near to each other that they must soon merge into one town or city. The several locations are now known as

Lugonia, Redlands and Crafton.

While this locality, taken as a whole, is unsurpassed in grandeur and beauty of prospect and scenery, it also possesses the most substantial elements of prosperity. The climate is that peculiar to the warm belt of the foothills in every portion of this and the neighboring valleys. The air is singularly dry, pure and salubrious, and especially adapted to persons suffering from pulmonary and nasal or throat complaints. As a place for home-seekers who desire a warm, dry climate, with plenty of water for irrigation and good drainage, by means of underground pipes, which preclude all possibility of malaria, it cannot be excelled. As an evidence of the healthfulness of the climate and locality it may be stated that the average of deaths here for several years has not exceeded 6 in 1000. This is only about one-third the average death rate of country places; and this, too, notwithstanding large numbers come here on account of ill health.

The Soil is a Rich Red Loam

From which the central locality—Redlands—takes its name. It is composed of vegetable mold and decomposed granite. Both climate and soil are peculiarly adapted to the culture of citrus fruits, while the deciduous fruits and vines also do equally well. In no other part of California or the world can better oranges be grown than upon the redlands of this locality. As an evidence of this, the fact may be cited that here and upon its counterpart at Riverside, seedlings almost invariably produce fruit of an especially delicious character. This locality is destined to become the garden of the State—the queen settlement of Southern California.

The Boom and its Progress.

The recent advent of the Atchison & Topeka railroad into and through the heart of Southern California, and the railroad competition thereby created, coupled with the unfortunate attacks of King Frost upon the orange groves of Florida, have gradually led to the getting up of numerous large excursion parties into that part of the State without the necessity of having to encounter the storms, snows and winter blockades of the Central route. These excursionists have seen and been charmed with the natural loveliness and climatic advantages of this truly wonderful portion of the Golden State. Nearly all who have made these trips are people of means, or invalids more or less well-to-do, who have become tired and disgusted with the winds and storms and snows of the Atlantic and Northern States, and have made the trip to escape for a season from the inclemencies of their Eastern climate. Under these circumstances large numbers have either settled at once or returned to the East merely to close up their business and return to make California their future home. The objective point of these excursions has generally been the city of Los Angeles, where thousands have purchased suburban homes in that vicinity or gone into business within the limits of that rapidly growing city. At first the overflow from Los Angeles was into Pasadena, one of the most favored localities in Southern California. Gradually, however, it was discovered that the farther back they went, up the San Gabriel valley, the better the climatic advantages. Riverside, with its vast spread of loveliness and floral and pomological beauty, attracted not a few. Ontario, Cucamonga and other places all along the beautiful San Gabriel valley, picked up many of the Eastern visitors and seekers for new homes. Still retreating up the valley in search of newer, and if possible, better resorts for health and other natural advantages, the tide finally found itself blocked by the grand old mountains which look down upon the San Bernardino and San Gabriel valleys.

This locality was, at the time of our visit, some two months ago, a great center of attraction. The hotels were filled with visitors in search of health or homes. Real estate agents were driving hither and yon, each with one or more at his elbow in search either of a home or a good field for investment. New streets and roads were being laid out in every direction. Houses of brick and wood were going up as fast as laborers could be found to build them. Scores of plows were to be seen everywhere breaking up new ground or cultivating old. Orange orchards and vineyards were being set out; the streets were crowded with teams, hauling building materials, household supplies, merchandise, etc.; and in some places quadrupled in

value within the past few months, was still going up; and everything betokened

A Busy Scene of Enterprise and Industry, Which indicated, in a most unmistakable manner, an early and prosperous future for the large and important town which must soon cover the present site of the three localities named. Spacious blocks and trade palaces may never be realized there, but lovely homes, elegant villas, crowded hostleries, beautiful parks, extensive streets and shaded avenues will soon cover many square miles of this portion of the San Bernardino valley. What the future name of the town may be is as yet undecided; but the feeling is continually growing stronger that some common name should be decided upon. If we were allowed to make a suggestion, we would submit that of Lugonia, which is already well known as the postoffice name. It is short, easily pronounced and spelled, euphonious, and has no similarity in sound to any other town or city on the Pacific Coast. Moreover, it is derived from the name of the first settler who obtained a grant of all this portion of the valley from the Mexican Government. Surely his name should be kept in remembrance, and what more appropriate way to do so than to affix it to the future city which is to grow up on the land which he was the first to cultivate and improve?

A steam or motor road has been projected to connect this locality with Colton and San Bernardino and the continental system of roads which concentrate there.

The Prospect House.

This is the only hotel now open in Redlands. It occupies a commanding site on the terrace which forms the eastern border of the settlement. The view from this house is magnificent. It is under the management of Dr. J. A. Mack, lately from Chicago, and is constantly full of boarders. It is one of the finest hotel sites in the valley, and will no doubt soon be greatly enlarged and improved in its architectural appearance.

Lugonia.

Which is located less than half a mile from Redlands center, is already rapidly growing in importance and population. A fine block of buildings is just being completed on the "Terrace," just opposite the postoffice, one portion of which will be occupied by the bank, and another portion by stores, offices, etc. All the land along the Terrace and the Sankey from this point to Dr. Stillman's vineyard—about one mile—has been laid out in lots for building purposes, with wide streets and avenues. The most of this land has been bonded to Mr. I. N. Hoag, formerly of Sacramento; at the time of our visit, he was making preparations to build a residence for himself upon one of the lots. Mr. Hoag has transplanted to his lot a large number of 8 or 10-year-old orange trees, which were taken up to make room for the bank building. They were all in full bloom at the time of removal, and at last accounts were doing well—not even losing the fruit which was just then setting. He will, no doubt, have the pleasure of surrounding his new home at once with a grove of bearing orange trees.

The Terrace Villa Hotel

Is a very handsome and highly ornamental structure, situated upon a slightly elevated terrace, near the center of the beautiful village of Lugonia. The view from every part of the house is both beautiful and grand. Lofty snow-capped mountains are seen at a distance upon three sides, with an open vista to the west, which looks for fully 60 miles down the San Gabriel valley. The hotel is located directly in the midst of an orange grove, with orange orchards and vineyards covering all the country around. It is also embowered in roses and flowering plants and shrubs of every variety. It is supplied with the purest mountain water and fitted up with every modern convenience. The table is supplied with the best of everything and elegantly served. The interior is roomy, well furnished, well ventilated and contains 45 rooms, 16 of which have been recently added to accommodate the rapidly increasing numbers of roomers and visitors. The dining-room of this hotel is one of the finest in Southern California. Mr. Frank Smith, the landlord, is well known throughout the central portions of the State as having formerly presided over the Piedmont house at Oakland and Highland springs in Lake county. The regular boarder or transient visitor will find in him a pleasant and accommodating landlord and a thorough gentleman, while Mrs. Smith is a host in herself—everywhere present, looking after everything in person from the kitchen to the parlor, making all her friends and guests completely at home in all their wants or pleasures. No pleasanter place for a visit or a domicile can be found in all Southern California. There is a good lively stable connected with the hotel, and nothing, in fact, is wanting to make it a most enjoyable place of resort at any season of the year, for here spring and summer are blended in ever and delightful presence from January till December.

W. B. E.

MINERS are "working" the black-sand deposits on the Watsonville beach, and are said to be making \$7 per day to the man. The sand is first "concentrated," and then shipped to San Francisco to be smelted. If they are making what they report, they are doing better than any other beach-sand miners have ever been able to accomplish for more than two consecutive days.

Geological Theories.

EDITORS PRESS:—With your kind permission, I will reply to a criticism from Mr. Storms which appears in your issue of May 28th. In the first place, I would remark that it was very kind of him to inform your readers what my true meaning was when I used the word "aqueous" in the article which he criticises. Hereafter, whenever you may favor me with space in your columns, and any of your readers should entertain a doubt as to the sense in which I have used any particular word, I suggest that they refer to Webster for an explanation, and form a conclusion in accordance with the definition he gives. In order to reply to Mr. Storms' strictures, I have need to restate here a portion of my former article: "They (the geologists) have assumed that granite is an igneous production—first formed of all the rocks—the backbone of the earth. Furthermore, that there have been deposited on the granite everywhere a uniform system of aqueous formations, numerous, distinct and identifiable, amounting in the aggregate to an average thickness of about 10 miles; therefore, when in any particular region the upper portion of the series, according to their classification, is wanting, in order to maintain their principles they resort to the expedient of assuming that the missing portions have been removed by denudation." Mr. Storms says that "if such theories are advanced they are certainly not from recognized authority."

I will show that in the foregoing quotation Mr. Storms has made a positive statement which cannot be sustained. The following quotation is from the Cyclopaedia Britannica, page 308, in the article on geology. "It was once a firmly held tenet that granite is the oldest of rocks, the foundation on which all other rocks have been laid down." I quote as follows from Le Conte's Elements of Geology, page 217: "Even geologists who believe that granite is the primitive rock have been compelled to admit that there is also a metamorphic granite, scarcely distinguishable from primitive granite. Not only gneiss, but even granite, is sometimes interstratified with unchanged fossiliferous rock." According to this view every portion of the earth's crust has been worked over and over again, passing through the several conditions of soil sediment, stratified rock, metamorphic rock, and igneous rock, perhaps many times in the course of the geological history of the earth, and we look in vain for the primitive rock of the earth's crust." We learn by the foregoing quotations that formerly all geologists regarded granite as the primitive rock. At the present time they are divided in opinion in consequence of granite having been found interstratified with unchanged fossiliferous rock, but those of them who doubt its primitive character still insist on the fact of its igneous origin. The inconsistency of the latter view must be apparent to any one familiar with the subject who is not geologically rut-bound; for it is impossible that any large molten mass could become interstratified with sandstone or any sedimentary formation without producing some obvious change in the subjacent rock at the point of contact. Concerning the thickness of stratified rocks, I quote from Dr. Buckland's "Bridgewater Treatise," Vol. I, page 39, as follows: "The aggregate of all the European stratified series may be considered to be at least ten miles," and on page 135 of Lyell's "Principles of Geology," Vol. I, there is a classified list of formations given, numbering 38. Mr. Storms says that at the time Darwin wrote concerning the large, denuded granitic area in South America, geology had not reached its present high standing. It may fairly be presumed that Darwin was at that time as competent to decide whether a rock was granite as the geologists of the present time are, notwithstanding the fact that Mr. Storms gives it as his opinion that the rock referred to was of some other kind, though he says he never saw it himself. I do not regard this passage of Mr. Storms' article as being a very pointed refutation of any argument of mine. But Mr. Storms evades the strongest point made in my article which he criticises. I have need to repeat from it as follows: "But there is another fact not so conveniently adjustable to theory. There are found lying side by side in the same horizontal line the fossils of the extreme polar and tropical animals. I challenge any local savant to give a logical explanation of it in consonance with the principles of geology as now taught." I renew this challenge to Mr. Storms or others who may choose to take it up.

JUSTIN CHENOWETH.

San Francisco, June 6, 1887.

U. S. ASSAY OFFICE AT BOISE CITY.—For each month this year the receipts of gold bullion at the Government Assay Office, at Boise City, have been from three to five times greater than those of the corresponding months last year, the extraordinary inducements offered by the Government, and the satisfactory returns given by the U. S. Assay Office here, having turned the bullion to this office from mining districts never before reached. The receipts for May of this year were 5081 ounces of gold bullion valued at \$82,297.93, as against 1275 ounces, valued at \$20,669, for May of 1886.—*Idaho Statesman.*

Prospects in Arizona.

EDITORS PRESS:—The year 1887 finds Arizona moving along quietly but surely to success in all things. We have no big mining boom on deck, but go where you will in any mining camp, and you will find the boys busy taking out ore to ship, and all are feeling more cheerful. Mr. Cockburn and others are putting up sampling works in Prescott. The Denver smelting men have been here to secure the ore, and the railroads are trying to help the miners to get their ore where it can be reduced to bullion. There are several carloads awaiting to be sampled. The pack trains are coming down loaded with ore, from the mountains to the roads, where it is loaded on to freight wagons and brought to Prescott. The P. & A. C. R. R. will undoubtedly run on to Phoenix this

A NATIVE CALIFORNIA MEDICINAL PLANT—Grindella Robusta.

year. The Maricopa road is already completed to Temple and will soon be in Phoenix. The Silver Belt road is being pushed from Flagstaff to Globe. The Walnut Grove Water Storage and Hydraulic Mining Co. are hiring all the men they can get, working night and day. While Illinois and Ohio farmers are coming in buying ranches in the agricultural part of Arizona, bringing with them experience, push, energy, ingenuity, and money to fit up elegant homes, everybody is agitating the question of putting down artesian wells. The stockmen are securing better stock to breed from, while the horticulturist is putting out more trees and vines. It is no use to deny the fact that good grapes, figs, lemons and oranges do grow in Arizona, and all smaller fruits in abundance where water can be had; and all you have got to do is to go down after the water to secure to your heart's content all you want. Those that have gone into bee-keeping are doing well. I have eaten as fine honey made from the wild flowers of Arizona as can be had anywhere. Our ranchers ought to pay more attention to putting out flowering shrubs and vines, for they beautify home and are useful. It now seems to be a fact that the Colorado Canal Co. will be a success. If so, it will open up thousands of acres of land for settlement.

Grindella Robusta.

We give on this page a native California plant which is becoming quite famous for its medicinal virtues. We take the engraving and description from a very interesting contribution to systematic knowledge of our American medicinal plants made by Dr. George Vassy, botanist to the Department of Agriculture in Washington.

The *Grindella robusta*, or "gum plant," is an herbaceous perennial plant of the order Compositae, growing in California. It has an erect, leafy stem, one to two feet high, branching near the top, the branches terminating by a single compound head of flowers, somewhat resembling the flower-head of saffron, the body of which is about one inch across, with the narrow, strap-shaped yellow flowers spreading out

has some reputation in California as a medicinal plant, particularly as an antidote to the poisoning of the poison-oak, *Rhus lobata*. It has also within a few years past been introduced into medical practice for use in chills and other diseases. Upon the right of the engraving, at Fig. 1, is an enlarged disk-flower, showing the achenium surmounted by the rigid, awl-like pappus.

Mining.

Not many people realize that the intelligence and comfort of this world began with mining, that the intelligence and comfort of the world has expanded in the same ratio that mining and the use of metal have. When savage man built, by accident, a fire upon a bed of iron carbonates, and found, next morning, a substance harder than stone and yet malleable; when, from it, he pointed an arrow, he made the javelin of the Greeks, the heavy spears of the Romans, the steam engine and the steamship possible. Better still, he made it possible to clear the forests; to cultivate the soil and to make comfortable habitations for mankind. When he found gold and silver and learned something of their peculiar properties, of their indestructibility, their perfect ductility, their freedom from corrosion; their exact fitness as a measure of labor, and therefore as a measure of value, then the breath of life was breathed into the infant nostrils of trade, and all modern commerce was made possible. From those beginnings, the upward progress in the working and combining of the metals marks the upward progress of the world. The wooden stick gave way to the iron plow; the bark canoe gave way to the wooden ship, because men had tools to fashion it and bolts to hold it in place; houses appeared in lieu of the caves and the piles of stone that before had made the abodes of men; art was born, and, hand in hand with science, began the work of subduing the world. The conquest has been going on ever since, and it has rested more on mining than on all beside. The generous earth gives man bread to sustain his life, but within earth is held the material which makes man's work effective. The dull ore gives no sign as it is brought forth, but under hammer and fire it becomes transfigured. It materializes into chariots and ships; it turned the sun back in gold from the great temple at Jerusalem; it sparkles on the bosom of beauty; it commands man's best service, and its absence or abundance marks the ratio of civilization which any land possesses. It made old Rome glorious with temples and with power; as it grew scarce distress came and then ignorance and crime, and the world lay in the twilight of the Medieval ages until the discoveries in the New World fired anew the arteries of trade, and quickened the intelligence of men to once more renew their assaults upon barbarism. The discovery of gold in California gave to the nation in a single decade more advancement than four preceding decades had; the \$1,800,000,000 which in gold and silver has been added to the treasury of the nation since that discovery 38 years ago, has advanced the republic from the place of a dependent power, so far as material wealth was concerned, to the foremost place among the nations of the earth. The moving springs have been the miners' pick and drill and the miner behind them. Mining is the one business that creates money and carries forward the forces of the earth; and its results are more like God's work than any other known to man.—*Salt Lake Tribune.*

MINING ACCIDENT.—On Friday of last week, when miners were going on shift at the Sharon shaft at the Ohollar croppings, a cage on which were four men went to the bottom with a rush. All four were badly injured, and one of them so badly that he lived only a few hours. The men were Luke Quinlan, John McCabe, Michael McDonald and Richard Pascoe. The men went into the mine through a tunnel that connects with the shaft at a point 250 feet from its bottom. Finding a cage at the station in the south compartment of the shaft, the four men got aboard of it, intending to ring themselves down the shaft. No sooner had they hoisted the cage, however, than it began to descend, and soon was rushing down with great velocity. It went to the bottom 250 feet below where they hoisted. Richard Pascoe was killed by this accident, and the coroner's jury gave a verdict to the effect that his death was due "to the negligence of the engineer in charge, who carelessly unhitched the cage from the engine, thereby causing it to descend to the bottom of the shaft with such rapidity as to result in the death of Richard Pascoe."

THE HYDRAULIC ELEVATOR AT NORTH BLOOMFIELD.—The hydraulic elevator recently put up in the North Bloomfield mine is pronounced an assured success. By it the gravel is raised 85 feet through an inclined pipe, being forced by 1400 miners' inches of water under a pressure of 530 feet. This action completely disintegrates the clay and gravel, which are then washed through a flume laid with wooden blocks, in the usual manner, and the debris deposited on the washed-out bedrock in the mine. The water when it escapes from this carries off no debris to the rivers. This appears to offer a solution to the hydraulic mining companies who have at command a sufficient supply of water to use the elevators.

Passing Events.

The completion of the mammoth hydraulic dock of the Union Iron Works, in this city, and the raising of the first vessel by it, which occurred this week, is an event of great importance. The dock is of new design and capable of raising vessels of the largest size.

In mining matters there is little new to report aside from what is given in our usual mining summary. Work is being vigorously prosecuted in all directions.

Arrangements are nearly completed for running the big stamp and pan mill of the Consolidated California and Virginia mine on the Comstock by water-power. The power is to be transmitted a very long distance by wire rope, the water-wheels being placed in the shaft.

The New Drydock.

The new drydock of the Union Iron Works was used for the first time this week. It was used, moreover, to lift the first steel steamer ever built on this coast—the Arago—built by the same works. The dock consists of a huge platform which is lifted by 36 hydraulic cylinders. The dock is 450 feet long and 66 feet wide, a size sufficient to take on the largest steamer which ever comes to this port.

It was designed by Geo. W. Dickie, the well-known mechanical engineer, and built under his supervision. The cost has been upward of \$400,000, but it is a most complete appliance which the Union Works, in view of their shipbuilding and ship-repair work, could scarcely

do without. Iron steamers and vessels can now be docked and have any repairs or alterations desirable made in every detail at the Union yard. It is not only a valuable adjunct to the Union Works, but of the greatest use to the owners of vessels. We reserve a detailed description until an engraving of the new drydock can be prepared.

Facts, Fancies and Fictions in Mining.

The aptness of the adage, "Every man to his trade," finds frequent illustration in much that is written on the subject of mining by persons little conversant with the business. A case in point is supplied by an article on the production of gold in North America, published in an English journal of high repute, called the *Nineteenth Century*. Describing the geographical position of the region in which the auriferous deposits occur, the author of this article remarks as follows: "The precious metal is to be found in that long double chain of mountains which extends between the coasts of the Atlantic and the plains of the center," the long double chain here alluded to being the Rocky mountains. Locating the principal goldfield of North America in the Rocky mountains, and placing these mountains "between the coasts of the Atlantic and the plains of the center," evinces a sad ignorance of both history and geography. The most of the gold obtained in this country came from the Pacific slope of the Sierra Nevada, a locality more than 1000 miles west of the Rocky mountains, which latter are situated, not between the Atlantic Coast and the great plains of the interior, but to the west of those plains.

Speaking of the amount of gold taken out in the several countries lying west of the Rocky mountains, the writer tells us that British Columbia produces annually about half a million sterling—\$2,500,000. The gold product of that Province was at the time the above article was written less than \$1,000,000, nor has it, for any year since, much exceeded three-quarters of a million, the figure for 1886 being \$742,845.

Pursuing the subject, this writer informs us that the States of Idaho, Montana, Oregon, and Washington yielded in 1870 about 1,000,000 sterling—\$5,000,000. The product of these countries (only one of which, Oregon, is a State) amounted for the year mentioned to \$18,000,000; this being the figure officially reported by Dr. Raymond, Congressional Commissioner of Statistics—local authorities having claimed somewhat more. Concerning Idaho, we have the assurance that in 1880 she distinguished herself by the royal output of \$510,546; though Burchard, Director of the Mint, says it was \$2,430,000, a statement amply corroborated by other authorities.

Touching the placer mines of California, our scribe holds forth in this wise: "After the year 1848 the washings of the river sands produced immense quantities of gold; now only the Chinese find this efficient to procure them subsistence." By "the river sands" the man means, of course, our auriferous deposits known as surface placers, of whatever kind.

In some editorial remarks on this subject published in the last issue of the PRESS, we make the statement that there are employed in this class of diggings between 8000 and 10,000 men, all of whom, working only a portion of the time, make fair, and many of them large wages. Never in the history of the State has the number of men so employed been less than it is at present; the prospect now being that it will for some years to come be materially increased. Instead of "the superficial washings" having been long ago exhausted, as this writer affirms, they have shown but little diminution for the last 25 years, the tendency of late being toward expansion, as in this recent editorial we have undertaken to show.

But if this party speaks so disparagingly of our placer mines, he makes ample amends when he comes to talk about our vein deposits, as witness the following touching the great dominating lode of the State: "The 'mother lode' commences in Mariposa and passes the limit of the State at the north, where it is covered by the lava of the powerful and as yet *unextinct* volcanoes, Pilot Peak and Lassen Peak." Translating this into intelligible language, our author would have the reader understand that what is known as the "mother lode" of California, commencing in Mariposa county, can be traced thence north 300 miles, where it disap-

pears, being covered up by the lava flow from two active volcanoes. If not quite correct, the above statement possesses at least the merit of novelty. So far as surface indications go, the presence of the lode here spoken of can be recognized for a linear distance of 25 or 30 miles, hardly more. We wish we had better authority for the statement that it can be identified all the way north to Oregon. In claiming for our State all manner of prodigies, we Californians have never been accused of an excess of modesty, but really we have not the cheek to claim for our "mother lode" anything like the length here assigned it.

From the passage above quoted, one would be led to infer that Pilot Peak and Lassen's Peak were situated beyond the California line, whereas they stand a long way to the south of it. If these peaks are *unextinct* volcanoes, as this writer tells us, this again will be news to most Californians. It will not be denied that we have long felt the want of a lava-spouting mountain in this State, the more frequent and violent its eruptions the better. To think that they should have these both to the north and the south of us, and yet never a one in a country that can boast of the *Sequoiu gigantea* and the Yosemite! Even the clouded Kanaka, pointing to the ever-seething crater of Mauna Loa, has been able to deride us! Our humiliation is profound! We are consumed with envy. But let us take courage. If the word of this English writer may be trusted, we have no less than two powerful volcanoes in our midst, both "going concerns." If not belching forth flames just at present, they are, to say the least, *unextinct*. Moreover, there is a tradition that one of these has been seen to smoke. If this habit is as little curable with mountains as with men, there is reason to hope that the tall cone that commemorates the name of Peter Lassen will some day indulge in another good puff and possibly a prolonged smoke, thus adding another wonder to the scenic attractions of California.

Passing over into the Sagebrush State, we learn, through this contributor to the *Nineteenth Century*, that the Virginia range in which the Comstock lode occurs runs parallel with and to the west of the Sierra Nevada. Nature having located the above range to the east of the Sierra Nevada, it is likely to stay there, despite the change here attempted in the topography of the country. In regard to the finding of the great Washoe lode, our author falls into several errors: Henry Comstock was not its discoverer, nor did this event happen in 1869. It was discovered by other parties, and in the year 1858. But now we have two consecutive facts correctly stated: Henry Comstock did sell his claim and afterward commit suicide. This achieved, the writer relapses into his old habit of romancing, going on to inform the reader that of the entire stock of gold in the world, North America has contributed £14,000,000—\$70,000,000. The sum so contributed amounts to very nearly a billion dollars. Being an Englishman, the writer may be excused for expressing the opinion that the country north of the Rocky mountains—to wit, British Columbia—is where we are to look for happy discoveries of gold in the future. Whether or not this shall prove to be the case, certain it is, no country on earth stands more in need of such discovery than that forlorn and dismal region.

Truly, the man who knows nothing about mines and mining had better leave their discussion to others. But, so it is, the task that we mortals are least fitted to perform is the one we are often most anxious to undertake. We have known miners who would persist in dabbling in literature or engaging in other pursuits for which they had no fitness, though their efforts earned for them nothing but ridicule. How signal would be our failure should we essay the work of the writer here criticised, supposing him to be a harber, for instance. Wrestling with mining facts we feel somewhat at home; contending for eupremacy in the art of tomorial an ignominious defeat awaits us. Again we say, "Every man to his trade."

STATE MINERALOGIST IRELAN and Professor Jackson of the University of California are about to examine the numerous specimens of bituminous rock recently sent to the bureau from Alameda, San Mateo, Contra Costa and other counties. It is expected that this rock may be valuable for paving purposes.

An Improved Headlight.

In the usual construction and use of headlights for locomotive they are fixed to the front of the engine so that the light is always thrown forward and concentrated in one line. This shows the track clearly enough when the line is straight, but if there are sharp curves, the line of direction will throw the light outside of the line of the rails within a few yards in some cases, and leave the line of the track or the inner line or embankment of the curve in comparative darkness. To overcome this difficulty, Dr. William Dutch, of this city, has just patented, through the MINING AND SCIENTIFIC PRESS patent agency, a headlight with an adjustment which will allow the engineer to direct the light to various points off the line. The lantern is supported on a frame or platform which has a movement to right or left about a vertical axis, and up and down about a horizontal axis. The operating mechanism leads back to the cab so as to be in handy reach of the engineer.

By the arrangement patented the engineer is enabled to examine dangerous or doubtful parts of the road, and in stormy weather to turn the light upon threatening trees or masses of earth or rock upon either side which may be in danger of falling, so that if they appear in a dangerous condition he may instantly check his speed or stop. The device also enables him to turn the lantern so as to throw the light across sharp corners and examine the line of track at some distance ahead of the train and at points which would be entirely out of reach of the light in its usual fixed position.

It will be manifest that a lantern or headlight having a similar adjusting mechanism may be mounted on a vessel and would be of great advantage when running in crowded harbors or channels, or in making landings at wharves or docks, as the light could be turned to either side and collisions or accidents be avoided. This mechanism may also be employed for other similar purposes—as in hydraulic mining claims which are to be worked at night and when different portions are to be examined. Some of these lights are now being manufactured in this city.

Air Locomotive for Mine Work.

We saw at the Phoenix Iron Works, this week, a pneumatic locomotive and plant, which is shortly to be put in operation at the great gold mine at Douglas Island, Alaska. The engine is intended to haul cars of ore from the tunnel to the mill, a trip of about 1600 feet.

The compressor and the locomotive are of new design. The ram or compressor is a quadruplex five by eight and compresses the air to 200 pounds pressure, which is the working pressure. This compressor will be set up next to the rock-breaker at the mill, and will be run by belt from the rock-breaker shaft. A pipe will lead from the compressor to a large reservoir or tank, which will be placed alongside the grizzlies at the end of the mill. The tank is 30 inches by 12 feet. The pressure of 300 in this gives 200 pounds pressure on the engine-tank. The engine will run down to the receiver for its supply of air each trip, the trips being made every 15 minutes.

The locomotive is very compactly built and is of neat design. It is 8 feet long over all and 36 inches wide. The height is 4 feet 6 inches. The tank of the engine is 26 inches by 5 feet. The cylinders are 4x10; drivers, 24 inches. The engine is arranged with reducing valve to average about 35 pounds working pressure. It is calculated to haul 5 tons of ore on a half-per-cent grade, at the rate of 800 feet per minute.

Although pneumatic engines are, of course, well known, it is a new scheme to use them underground on this coast. The whole plant was designed by Rix & Firth, of the Phoenix Works. The engine was tested at the shop this week. The engine-tank fills in about four seconds. The design and work reflect credit on the builders, who have succeeded in getting up a compact locomotive for mining work, which it is hoped will be followed by many others for a similar purpose.

THE forty-eighth meeting of the American Institute of Mining Engineers will be held in Utah and Montana, beginning at Salt Lake City on Wednesday evening, July 6th.

Wallapai District, Arizona.

We had a conversation this week with Mr. Wm. Larkin, assistant postmaster at Kingman, Arizona, who is on a visit to this city. He exhibited to us a number of specimens of ore from the mines of Mohave county, and from him we gained some facts of interest regarding mining matters in that region. Mohave county, which embraces the northwestern portion of Arizona, is possessed of some rich and valuable mines, and the attention of capitalists and mining men is now being turned in that direction. Kingman, the county seat, is now enjoying a building boom. The country is beginning to be developed in earnest since the railroad came in. There are about 600 men in Wallapai district. There are sampling works at Kingman, where the ore are sampled, and then shipped to Pueblo, Colo., to be worked. The works crush about 400 tons of ore a week. There is also talk of putting up reduction works at Todd Basin, where there is a large body of low-grade ore, which will scarcely bear shipment. Kingman is now one of the most important towns on the line of the A. & P. R. R. between San Bernardino on the west and Albuquerque on the east.

A number of important mining deals have taken place in the region within the past year, all of which have turned out profitably to the buyers. The Prince George mine, located at Stockton Hill, was purchased by L. P. Drexler, G. H. Dana and M. D. Howell, all of this city, the purchase price being taken out in less than 30 days. The purchase of the C. O. D. mine, at a very high figure, by the same parties, even proved much more profitable than the Prince George. The owners, being well pleased, are now looking for other mining properties and have the purchase of some under consideration. Another important sale which was closed a few days ago was that of the Flores mine to an Eastern company by H. Raymond and J. M. Murphy, they receiving a fabulous sum for their property. We also note the recording a few days ago of the Gray Bros. property, sold to an Eastern company. A half interest in the Rural mine, situated at Mineral Park, was sold a few months ago, and double the purchase price has been taken out since. This mine has produced some of the finest specimens ever taken out of a mine, lumps of wire silver being found in abundance. Some threads of the wire silver are as fine as silk, while others are one-fourth inch in diameter; but the most valuable and best-developed mine in the county is the American Flag, at Wallapai mountains, owned by Richards, Corin & Co. The ore taken out is of a very high grade of ruby and antimonial silver, and will rank with ore taken from any mine in Arizona. A very rich strike was made a few days ago in the Cupel mine, at Stockton Hill, owned by Spruance, Stanley & Co., of this city, and under the supervision of Jno. Mackenzie. The Little Chief, Keyetone, Rainbow, Monarch, Dean, and many others, are valuable properties, and would be good prospects for any company to take hold of.

The deepest workings in the district are 200 feet. The best-developed mine in the county is the American Flag, where they have about six miles of tunnels, drifts, etc. It is owned by Richards, Corin & Pembertbey.

The Reno reduction works are kept constantly going, and it is now certain that the capacity of the establishment will have to be increased or other works of that kind erected if business continues to increase. They are now receiving ore from California and all portions of Nevada, and the returns have been so far entirely satisfactory.

ONE HUNDRED OUNCES of platinum has been received at Portland from Granite creek, British Columbia. With the exception of a few ounces from Southern Oregon, this is the first lot of platinum that has been received at Portland.

W. A. GOODYEAR is still in the southern counties examining petroleum and asphaltums.

Foundry Notes.

Most of the foundries and machine-shops have considerable work on hand just at present. The largest number of men are at the Union Iron Works, where there are now 1100 at work in the various departments. Their shipbuilding and repair department is specially busy just now. They are at work on No. 6, to be christened the Victoria, a steel steamer, the hull of which is completed, and the upper works being put on. Her boilers and engines are ready for her. The steamer Al Ki is also at the docks of the Union to receive new engines. The Umatilla is being changed from a collier to a passenger ship, and her upper works are being put on. The Wilmington is being re-

Alfred Russell Wallace.

One of the most distinguished scientific men of the age—Dr. Alfred Russell Wallace—has been for some weeks on a visit to San Francisco. While here he has delivered several lectures on Darwinism before those of our citizens interested in scientific research. We give on this page an engraving of Dr. Wallace, from a recent photograph by Taber.

Dr. Wallace was born at Uck, in Monmouth, Jan. 8, 1822, and was educated as a surveyor and architect, a calling he exercised until 1845, when he devoted himself exclusively to naturalistic studies. He spent four years on the Amazon and eight years on the Malay archipelago, making extensive zoological collections.

ALFRED RUSSELL WALLACE.

paired and overhauled. The steamer Colima is having new boilers put in and being generally overhauled and altered. The iron ship Taemania is having the collision damage repaired. The steamer Arago is out on the new drydock being repaired. Work is vigorously prosecuted on the U. S. cruiser Charleston, the various portions being made, though the keel is not yet in position.

The rolling-mills are running full-banded. They are busy on considerable cable railroad work at present, having the iron and steel work of the Market-street extension and Powell-street road. The steel they are now making is exceptionally good, considerable of it being furnished to the Union Iron Works for their Government cruiser job.

The Fulton Foundry has several engines on hand for steam boilers for the coaling trade. They are putting new boilers in a large steamship, and have a good deal of miscellaneous work in the shops.

The Phoenix Iron Works have just completed a new style of air locomotive, with compressors, etc., for mine purposes, which is referred to more at length in another column.

It was while living in the East, without knowing of Darwin's cognate researches and speculations, that he wrote a theory of development by natural selection, though not using the latter term. He, therefore, really published the theory of evolution before Darwin. He has published many valuable scientific works. Among these are "Travels on the Amazon and Rio Negro," "Palm Trees of the Amazon," "The Malay Archipelago," "Contributions to the Theory of Natural Selection," "The Geographical Distribution of Animals" (which practically founded a new science), "Tropical Nature," etc. He has also written a work "On Miracles and Modern Spiritualism."

Dr. Wallace is a member of the Royal Society, and has long been distinguished in the scientific world. It was curious that both he and Darwin should have been pursuing the same line of investigation, which led to the same results, without either knowing of the other's work. The modern theory of evolution was therefore the result of the conclusions of two independent thinkers. As it bears Darwin's name, however, he is better known in connection with the subject than Dr. Wallace.

Manufacture of Sulphuric Acid.

(Continued from page 393.)

results; and I beg to lay before the Institute my suggestions in this direction.

Fig. 1 is a view in perspective of a plant largely used in this country for burning pyrites "emalls." The position of the flues, upright, downright and horizontal, is modified to suit the conditions of the various works to which I attach this plant. The illustration is introduced here to show a form of dust-catching flues and cooling flues which will be new to most engineers, but also, and principally, to show the ordinary position which the Glover tower occupies with relation to the remainder of the plant.

My suggestions refer to a novel construction of flue, or series of flues, connected to and made a part of the gas flue leading from the limestone furnace, or from pyrites kilns or furnaces. They are intended to be substituted for the Glover tower, and to accomplish the same results in the manufacture of sulphuric acid, being, however, applicable to any size of plant, and, at small cost, forming a new link in the chain of a perfected process.

Fig. 2 is a perspective view of a plant which burns pyrites "emalls," and shows the dust-catching flue, somewhat modified from Fig. 1.

This sketch embodies my suggestion in a general way as adapted to small works burning pyrites.

In place of the tower in Fig. 1, horizontal flues of convenient length and size are used, containing the necessary acid-resisting materials to accomplish the same general distribution and filtration of gases, and saturation with acids as in the Glover tower, making it in fact a tower laid on its side, and which is called

The Adams Denitrating Flue.

It consists of a leaden bottom, pan-shaped, which carries sufficient acid at all times to insure freedom from corrosion, and to act automatically as a controller of the speed of burner gases.

The pan is supported upon a suitable floor and columns, as shown, at such height as will allow the chamber acids to feed the filters automatically, and permit the cooling and storage of concentrated acids without cost of handling.

The sides and end are of lead burned to the pan. They are stayed by perforated cast-iron plates which retain the shape of the flue and form the support for the top. The dome or top of the flue is made of materials chosen according to conditions of use, and is removable at pleasure. The connections to the chambers are not shown in detail, but will be readily understood.

Inside the flue, acid-resisting materials are placed along the walls and backed by crushed coke, glass, etc., which is a cushion upon and protection for the leaden sheets, keeping them from contact with the filters, hot acids or gases. Inside the wall-protecting lining, a non-corrosive "packing" fills the flue from top to bottom.

The construction is such that burner gases of any known temperature can be put through the flue without damage to its parts, excess of heat automatically bringing an excess of acid to the filters.

With the aid of Fig. 2, this explanation will be sufficient to show the simplicity of construction, the adaptability to existing works, and the novelty of the suggestion as compared to anything heretofore devised. Some new ideas are worked out by which the control and utilization of the entire heat of the burner gases will materially reduce the present cost of acids, while assuring a constant operation of the plant.

The essential features in a radical change of this character are: 1. Absolute control of chamber-temperatures. 2. No excessive weight of lining, packing, etc.; no corrosion; therefore no extraordinary repairs or stoppages. 3. All the acids from the chambers are concentrated to 63°-64° Baume by heat of burner gases. 4. Small cost of construction and unlimited capacity. 5. Saving over one-half of pumping cost, etc., involved in the delivery of the acids to the top of towers.

MECHANICAL PROGRESS.

Progress of Mechanical Science.

The following is an abstract from an address delivered before the section of Mechanical Science of the American Association for the Advancement of Science, at its late meeting at Buffalo, by O. Chsnute, of Kansas City:

In marked contrast with the past, the present age is one of pronounced material development. Formerly the brightest and most gifted men devoted themselves to religion, philosophy, politics, exploration, art; but for the past hundred years the attention of leading men of the civilized world has been directed to increasing and cheapening those products which minister to the daily life and comfort of man. Farmers, mechanics and laborers live now more comfortably than did the middle classes of feudal times; the duration of human life has been materially lengthened, and all portions of society recognize the importance of further progress, and the advantage of organization and invention in securing it.

This era of material progress may be said to have commenced with the final perfecting of the steam engine, which, together with the various attendant machines, takes the place of hand and animal labor, which has increased and cheapened the production of the necessities and luxuries of life; and it has pushed the inventor and the engineer to the front rank in modern society. It may be useful to point out the absolute necessity of verbal and written intercourse between investigators and inventors, that the speculation and curiosity of the former may ripen into the effective invention of the latter. Nothing is more remarkable than the multitude of minds and facts which are required for the perfecting of even a simple machine, nor how little the last man need to add to complete the invention. Facts and natural laws, known for years as curiosities, are taken up by some inventor, who fails in the attempt to render them of practical use; then a second genius lays hold, and profiting by the mistakes of the first, produces, at great cost, a working machine. Then comes the successful man, who works out the final practical design, and whether making or losing a fortune, he yet permanently benefits mankind.

The faculties of invention and discovery are generally separate. One set of men observe facts and deduce laws therefrom; and another set endeavor to turn the results of this observation and deduction to practical account in the production of labor-saving appliances. These men should meet one another, and profit by the interchange of ideas.

The well-worn history of the steam engine gives us an invention which did not spring full-grown from the brain of the inventor. History informs us that it commenced to exist 2000 years ago, in the colipile of Hero of Alexandria. His treatise remained hidden until translated and printed in 1547; and then Branca, the Italian architect, constructed one for pounding drugs. Hero's book ran through eight editions in different languages, and attracted the attention of a French inventor, who tried vainly to raise water by steam pressure. Then came the Marquis of Worcester, who died a disappointed man, after expending £250,000. Then de Morland tried using steam in cylinders, instead of in contact with the water; Papin built a steam-boat, only to have it seized and destroyed while on its way to England, and he, too, died broken-hearted and poor; Savery went back to using the steam directly in contact with water; and finally Newcomen built an engine that worked; and between 1705 and 1753 quite a number were erected. These engines had a duty of only 5,500,000 foot-pounds per pound of coal, the improvements of James Watt, an instrument-maker, increasing the duty to 60,000,000.

Oxidizability of Iron.—Some researches of a valuable nature have been made by a French metallurgist into the comparative oxidizability of cast iron, steel and soft iron under the influence of moist air, sea-water and acidulated water. With moist air it was found that in 20 days the steel plates lost from three grams to four grams for every two square decimeters of surface; chrome steel rusted more, and tungsten steel less, than the ordinary carburized steel; cast iron lost only about half as much as steel, and epiegelisen less than gray iron. Sea-water dissolves iron rapidly, and acts upon it more powerfully than on steel.

CASTING STEEL SHIPS.—A correspondent of the *Scientific American*, after reading Sir Henry Bessemer's proposition to cast in position the whole face of a fort, suggests that the same practice might be applied to the hulls of large war vessels. He thinks there can be no insurmountable obstacles in the way, and the plant once established could be used for a hundred or more vessels, which, when cast, could be cleared and floated away to be finished, the molds replaced and another cast in the same molds.

TO MAKE A FLANGE JOINT that won't leak nor burn out on steam pipes, mix two parts white lead to one part red lead to a stiff putty; spread on the flange evenly, and cut a liner of gauze wire—like mosquito-net wire—and lay on to the putty, of course cutting out the proper holes; then bring the flanges "fair," put in the bolts and turn the nuts on evenly. For a permanent joint this is A1.

Our Look Manufactures.

The lock manufacturers of the United States have always led the way in that branch of the mechanic arts, and just now they are making their English cousins particularly uncomfortable. The English correspondent of the *American Manufacturer* says: A few days ago I paid a visit to one of the largest factories of rim locks for the Colonial and Canadian markets, and I was informed by one of the principals that through the increasing severity of American competition it is impossible to get orders to keep the machinery running. Yet our manufacturers had hoisted great things, only a little while back, of the success with which they were going to compete. And this was one of the very factories, at the lock-making town of Willenhall, near Wolverhampton, where that boasting had been the loudest. The marked contrast between the confidence expressed by the principal on a former occasion and his dejection at present struck me as a little singular. For reasons best known to the Willenhall makers themselves, they have abandoned their intention, of which I advised Pittsburg manufacturers some time ago, of sending out to the Australias and Canada ornamental cast-iron-cased rim locks. They are intending to compete with another article. This is a machine-pressed, steel-cased rim lock, nicely japanned, and which will suit either hand. To make the lock stronger than ordinarily, the fore end instead of being merely sheet iron will now be made in cast malleable iron and will lap over the lock case, giving it an eighth of an inch bearing all round.

Further Attempt to Recover the Australian Market.

Pittsburg's competition has become so serious a matter that Willenhall manufacturers are forced to hestir themselves with increased energy. They express a determination not to give up the markets easily. The capital which they have sunk in machine plants specially to meet the Colonial and Canadian needs, they are determined shall not be wasted without a struggle. To the English makers, the matter is one of life or death, for their works are only half employed. Resolved to ascertain more than they now know of the causes of American success, Messrs. H. & T. Vaughan, an important firm, have this week dispatched one of their members on an Australian tour.

Ascertaining Pittsburg's Trade Secrets.

The tour is to be an extended one—probably of a year—and the ground to be covered is Australia, New Zealand, Canada and Tasmania. It is sought to ascertain exactly what you are doing in pushing your goods, the reasons of your growing success, and of the preference for American over English locks, and to collect patterns of the Pittsburg styles that are favored by the consumers. Accompanying this will be a determined effort to push the claims of native manufacturers. Customers are to be visited, and are to be made personally acquainted with the capabilities of English makers, and with the exact patterns and prices we are prepared to supply in competition.

NUMBER OF TUBES IN A BOILER.—It has been repeatedly proven by experiment that there can be too many tubes in a boiler; that all that is necessary is sufficient tube area for draught, and this will be sufficient to transmit all the heat possible. The law governing this, that the greater the difference in temperature the more rapid the transmission of heat from one body to another, is imperative. Nearly one-half of all the steam made is generated right over the fire. The boiler shell is usually about one-eighth of the total heating surface, and yet it evaporates three-fourths of the water. By adding more tubes than is necessary for draught the extra tubes become choked with soot, interfere with circulation, occupy space that with profit could be filled with water, and also increase the height of water-level.

CHANGES IN GLASS.—When glass is new it undergoes a slow but certain change; it slowly contracts. This period of change occupies from 12 to 18 months. Thermometer tubes, which are made of thick glass, any change in which would seriously affect the instrument, have to be kept for two years to be "seasoned," where very accurate instruments are required.

TINNING CAST IRON.—Small cast-iron pieces can be tinned by first thoroughly cleaning the articles to be tinned, and immersed in a bath of one ounce cream of tartar, one ounce protochloride of tin and 10 parts of water. The bath should be kept at a temperature of 190° in a stone vessel. Pieces of zinc should be thrown into the bath.

SHARPENING STEELS for butchers' and table use are really files, with the teeth running lengthwise instead of diagonally across. The teeth are produced by means of a hardened knurl, the steel being revolved in a lathe. The result is a series of fine lines raised from the stock and running from tang to point.

MACHINE GUNS FOR ITALY.—The Pratt & Whitney Co., Hartford, is making 150 Gardner improved machine guns for the Italian Government. They have 525 men employed.

THE FIRST WRITER ON MECHANICS.—It is believed that Aristotle, who lived 330 years B. C., wrote the first work on mechanics.

SCIENTIFIC PROGRESS.

The Influence of the Combustion of Coal Upon Our Atmosphere.

We give the following as an abstract of a paper read by Dr. Clemens Winkler before the German Mining Engineers' Convention, held at Dresden Sept. 5, 1885:

A hundred years ago people were still in doubt whether atmospheric air is a mechanical mixture or a chemical combination of its chief elements, oxygen and nitrogen. The fact that the two gases could be so easily separated was in favor of its being a compound, while the extraordinary constancy of its proportional composition seemed to indicate a chemical combination. The interest taken in this problem ceased rapidly as soon as it was proven with certainty that the oxygen and nitrogen of the atmosphere exist beside each other in a free state, and that the extraordinary and never-subsiding motion of the aerical ocean, which is produced by the influence of the sunbeams, causes a constant and intimate mixture of its elements.

Later investigations proved that solar radiation, beside this merely mechanical influence, exercises also a chemical, or rather a chemico-physiological, influence to preserve the constancy of its mixture. It was further recognized at an early date that atmospheric air always and everywhere contains some carbonic acid. But its amount seemed to be too insignificant a share to be worth any attention; yet how enormous is the absolute magnitude which this small proportion of carbonic acid in the air constitutes, considering the great expanse of the atmosphere. This was not fully understood until man's horizon extended; until his perceptive faculty grew and his intellectual eye learned to comprise worlds; until he had succeeded in determining the weight of this our earth and its atmosphere. Then the imposing transmigration of carbon taking place in the atmosphere was recognized. It was stated that all carbonic acid which enters into the air by combustion, respiration, decay and otherwise, is converted under the influence of sunlight through the vegetable kingdom into organized carbon combinations, viz., into plants, and the liberated oxygen returns into the atmosphere. As this change takes place on a large scale, it is the chief condition of a constant composition of the atmospheric air. Thus the carbonic acid is prepared as food for the vegetable kingdom, and the aerical ocean serves as a storehouse, the stock of which by this unceasing exchange is kept at a constant level. Since our observations were recorded, which certainly is no longer than a few hundred years, the amount of carbonic acid in atmospheric air remained almost unchanged.

But geology tells us that there has been a period in which the atmosphere was more saturated. In their early era the temperature of our planet, being like that of a hothouse, produced a gigantic flora which later on in its decline formed the large coal deposits on earth. The same carbonic acid, which, in immemorial times, roared and stormed through the high calamities of the paleozoic era, sunk as a petrified vegetable organism into a long and death-like sleep awaiting a new resurrection in our days. It is the miner who awakens it to a new life which means a new chemical activity, and civilized mankind are hence engaged to restore it to the great circulation of nature. Thus the man of our country heats with the glow which was blazing down upon earth long before men were living on its surface, and it is this heat to which the present time owes the gigantic development by which it is characterized.

Compare conditions of to-day with those 50 years ago in countries where large industries exist, and you will be astonished at the change in such a short space of time. It is almost a superabundance of force in which humankind indulges, since we have succeeded in unlocking the coal treasures underground, and make them subservient to our wants. Man indeed fully understood how to put the talent in his trust on usury. On the one hand he is not free from the reproach of profusion, yet on the other he must be credited for having lifted himself, with the help of the black hound, to an intellectual height which never before was attained, not even in classical antiquity.

Our era is in the full sense of the word an era of combustion. Everywhere in places of industrial activity we see glowing hearths fed with fossil carbon; we meet with stationary, with movable and with floating chimneys which unceasingly send forth into the aerical ocean the gaseous products of combustion, viz., carbonic acid.

The quantum of carbonic acid which humankind at present produces by combustion, for either the procreation of heat or energy, or light or electricity, is extraordinary and greatly enhanced in comparison to former times. This is done to such an extent that we may ask whether a reintroduction of carbon, which has been latent for many geological periods into the circulation of the terrestrial interchange of matter, by the combustion of coal on so large a scale, may not possibly cause a change of our atmosphere so as to disturb its chemical equilibrium. We may decidedly answer this question in the negative.

The amount of carbon which is wrested from the interior of the earth by thousands of diligent hands, and by other thousands used for

combustion, is so exceedingly small as to dwindle away if compared to the gigantic stock contained in our terrestrial atmosphere. The difference is so insignificant—not over four one-hundredths of one per cent—that it could not be determined by the most minute methods of investigation.

From these and similar considerations we learn modesty when we compare human work to that of nature. Man's hand is too weak to interfere noticeably with the imposing mechanism of the cosmic gear. We work on a small scale, and too slowly to disturb the equilibrium of the proportions ruling on earth. This, our smallness, must not affect or oppress us. In spite of it our time is great—the greatest in which humankind has lived. We may indulge in comparisons like those we made, but an estimation of our works must be done according to human measure, for, after all, we are simply men.

NATURE'S MYSTERIOUS PROCESS.—Where the diamond comes from nobody knows. You can no more predict the existence of diamonds than you can the existence of genius, although, to be sure, all diamond-fields to a certain extent resemble each other; and all, borrowing as they do their light from the sun, are found only in warm climates. Nor can you tell where the diamond goes to on combustion. Burn it and it leaves no ash; the flame is exterior like that of cork, and when it has blazed itself out there remains not even so much as would dust the antennae of a butterfly. If a man has his mysteries, his strange conversions, his going in a siner, his coming out a saint, so, too, has nature. The philosopher's stone is formed of the vilest materials, and the chimney-sweep is covered with that which, under happier auspices, would be jewels. This mysterious process of crystallization places between two bodies of the same nature a greater difference than between bodies differently composed. And yet not so great a mystery, either, for every year a process is discovered for making diamonds—only somehow the diamonds are never made, or, at the best, so microscopic, and at such an enormous expense, that they are absolutely useless except to gum on cards at the British Museum. In France, they say, a solution of phosphorus in sulphur of carbon yields minute diamonds, but things are better managed there than here, as has long been admitted.

TRANSFORMING HEAT INTO ELECTRICITY.—The London *Iron Trade Exchange* announces that Herben Hurghausen and Nerust have discovered a direct mode of transforming heat into electricity. It consists in placing a thin slip of metal in a magnetic field and maintaining its two ends at different temperatures, when a difference of potential is found between the two opposite sides of the slip. The direction of the current is reversed by reversing the direction of the magnetic field. The effect is, however, very slight. With a square plate of bismuth, measuring five centimeters on each side and two millimeters thick, a field of force represented by 6000 C. G. S. units, and a difference of temperature caused by placing a mica plate against two sides of the bismuth, one dipping in cold water and the other heated by a gas flame, the resulting difference of a potential was only 0.00125 volts. With iron instead of bismuth, the current is in the reverse direction.

ALUMINIUM SILVER ALLOY.—Alloy with a small per cent of silver, aluminium loses much of its malleability, but with five per cent of silver it can be worked well and takes a more beautiful polish than the pure metal. With three per cent of silver it is very suitable for philosophical instruments, being harder and whiter than the pure metal, and is not tarnished even by sulphuretted hydrogen. With small amounts of silver it appears very suitable for scale beams, and is now frequently used for this purpose. The alloy containing five per cent of silver has often been suggested for coin of small denominations, as it is hard, bright, and retains its luster in handling.

ELECTRICITY.—The velocity of a current of dynamic electricity, on the best possible conductor, suspended in air in such a way as to avoid all loss of power, is said to be about 280,000 miles per second. The term "current," as applied to electricity, is purely conventional. It is assumed to flow from carbon to zinc—or its equivalent—on the outer circuit. Two or more electro magnets, when connected in the same circuit, do not give off as much power as the two would if used separately. Each magnet added to a circuit will reduce to a certain extent the strength of all which were previously placed in circuit.

LIGHTING CARS BY ELECTRICITY.—The Connecticut River railroad is experimenting with a system of lighting the cars by electricity generated by power taken from an axle of the baggage car. The difficulty in maintaining a uniform speed of the dynamo is sought to be overcome by a speed regulator. A sufficient amount of electricity is stored in each car to keep the lamps aglow during stops at stations, and the storage is replenished as soon as the train starts again. Automatic couplings are used and ten lights are to be set in each car and one on each platform.

A FOG MAP.—A map showing the distribution of fog on the various parts of the earth has just been published by Admiral T. de Bort. The observations upon which it is based were made at 1600 land and 112,000 marine stations.

ENGINEERING NOTES.

A NEW MOTOR FOR LIQUID FUEL OR TAR.—A series of costly experiments in the use of coal tar as a fuel, extending over a period of five years, has just been completed in England. The results are stated by the experimenter to be very remarkable. With a consumption of two gallons of common coal tar per hour, he obtains a motive power of 30 horses. He says this can be still further improved in his present engine, which is the second he has constructed for the purpose of these experiments; but it has been altered and reconstructed so frequently, and in many cases so hastily, that he does not consider it prudent to put the increased strains on the working parts, which would be necessary in getting the higher efficiency. Arrangements are being made for constructing engines with all the improvements in design suggested by experiments, but even if no further improvements were effected the working cost is a mere fraction of what is required for the steam engine, for, at the present price of tar, the cost of running is at the rate of one penny per hour for 20-horse power. Shale oil, crude petroleum, or the waste remaining after refining petroleum, are equally available with coal tar. The heat produced by the combustion of the liquid fuel is intercepted at every point so effectually that the naked hand can be held in the exhaust pipe without injury.

GREAT INTERNAL SHIP CANALS.—Paris and Manchester having both resolved on a ship canal, it now appears that Brussels is determined not to be behind, and therefore a proposal has been made to the municipality to construct a ship canal to the Scheldt, having a depth of 6½ meters, with quays sufficiently capacious to allow 20 ships of 2500 tons each to unload or load, and the whole is to be connected with the great Belgian line of railway. The scheme is a bold one, but the company who will undertake it—if it is carried out—is an English one, and the contractors and workers will, doubtless, be English too. While on this subject, we may mention that such another scheme is about to be attempted in South Russia, by the cutting of a canal across the isthmus of Perekop, to connect the Sea of Azov with the waters of the Black sea. By this plan a saving of 100 miles of very rough sailing will be effected, and more especially the dangerous passage of Kertch, which in winter is constantly closed by ice. It is supposed that the making of this canal will greatly improve the coal and salt trades of Donetz and Odessa, which alone, in a commercial point of view, is a matter of the highest importance.

CONNECTING THE MISSISSIPPI WITH THE LAKES.—Two influences just now tend to boom this very necessary work; the fact that we have no ship entrance to the lakes for war vessels and the interstate law. Both these influences promise to be of great assistance to Chicago in securing the passage through the Illinois Legislature of the Sewage and Ship Canal bill. Mercantile and manufacturing interests all over the State now recognize the importance of establishing a route for the passage of large vessels between the Mississippi river and Lake Michigan. So genuine are the people of Chicago over the passage of the bill and the consequent building of the waterway, that a company has already been organized to operate a line of steamers between Chicago and New Orleans. Orders will be given for the construction of its fleet as soon as it is certain that this canal will be opened.

THE RAILWAY BOOM.—The records of the *Railway Age* show that from January 1 to April 1 no less than 1040 miles of new main track were laid on 49 different lines in 25 of the States and Territories. This is a larger total than we have recorded for any previous year up to the same date, excepting in 1882, when the construction for the entire year reached the unprecedented total of 11,568 miles. The mileage already laid in the three most unfavorable months of the year is greater than that added in any one of several years during the history of this country, and is only 700 miles less than the total new construction in the year 1875. If the record of recent years forms a basis for estimate, the work of the first three months of the year would seem to indicate that the track-laying for the year 1887 will aggregate from 8000 to 10,000 miles.

THE UNDERGROUND TRAFFIC OF LONDON.—The people of London are whirled from one part of the British metropolis to another by underground railway trains, on which the fare varies from two to four cents. The greater proportion of the tickets are sold for two cents. The trains are run at intervals of from a minute to a minute and a half. Nobody has ever been killed on this underground road, although more than 80,000,000 passengers are carried over it in a year. This is rapid transit worth talking about and enjoying.

THE TAY BRIDGE.—The ninth of the large central spans for the Tay bridge has now been raised to its full height. There are only four more girders to raise to complete the bridge. The work is proceeding rapidly.

LOCOMOTIVE OUTPUT.—The output of the locomotive works of this country at present is estimated to number nearly 40 engines per week.

GOOD HEALTH.

The Alleged Cancer Cure.

What a Medical Man Thinks of It.

Our readers will recollect a well-written article on the alleged "Cancer Cure" which appeared in our "Health" column during the month of May under the signature of "Medico on the Wing." It will also be recollected that the writer in question, an English physician who has had 14 years' experience in the cancer ward of one of the largest hospitals in England, while stopping for a few days in this city, became much interested in the present "cancer discussion," and took an opportunity to call upon Mrs. Dr. Cook, 224 Post street, whose name is now for the first time mentioned in this paper. He also visited and personally examined and catechized several of her patients. He concluded his communication with the following emphatic words in regard to his investigation:

"I do not regret it. I have done it profitably. I have caught a glimpse of a light which I hope may finally burst into a vast and luminous orb. I am satisfied that the assumption of a great discovery in the treatment of cancer has the appearance of being well founded. I have seen what cannot be seen in any part of Europe or America. I believe it to be a triumph for humanity and science. In its presence I stand again in the cancer wards of the Old World, holding in my hand a promise of hope to the hopeless. The medical faculty of the Pacific Coast should at once give it countenance and a respectful hearing. To reject it is to betray a dogmatism, a jealousy and a disloyalty to science and humanity that borders on criminality."

Our correspondent has again been heard from, and once more speaks hopefully and emphatically upon the subject. This time he writes from Boston, from which city he is about to embark for England, whither he goes to once more resume his duties in the cancer ward—this time, however, with "a promise of hope to the hopeless," which he trusts will soon prove "a triumph for humanity and science." It will be observed that he proposes to return to this city at an early day, with the intention, in case the organized body of our own physicians continue regardless of their duty to humanity and science, to join in the efforts of the little band of five or six of his brethren who are already engaged therein, and help on with the investigation with a determination to probe the matter to the bottom and ascertain the true extent and value of the treatment, which, upon its face, looks so hopeful of complete success. We bespeak a careful perusal of the present letter:

BOSTON, May 28, 1887.

MR. EDITOR:—On the ground of explanation and of duty, I write you from this city. Circumstances over which I had no control caused me to suddenly leave San Francisco before the time I had appointed, and it is here, while waiting for the steamer for England, that I seize upon the opportunity to address you a few thoughts in connection with those I communicated some weeks since. As were the trophies of Miltiades to the hero of Salamis, so have been to me since my departure the apparent trophies won in your city for science and humanity in the cure of cancer. From the very first moment of an awakened interest on my part in the new treatment, I have not ceased to dwell on this recent burst of light on the horizon of medical science. Up to the time of my leaving San Francisco I was contemplating a second visit of investigation to the physician to whom belonged the honor of discovery of the alleged cure of the malignant tumor. I greatly regret my sudden departure. I had there met a subject under new conditions, that from my earliest professional experience had occupied my mind as scarcely any other subject of medical treatment had.

I presume the physician in question little thought that on or about the 5th of April last she was entertaining one, with her decisive answers and eccentric exhibits, who had spent many years in a European cancer ward, and who was even more interested, if possible, in her own work than she was herself. Her confidence and enthusiasm in the efficacy of her system of treatment was of that strong type which always accompanies a deep-rooted faith and a consciousness of success.

She was interesting. She spoke philosophically. The blood with her was the great eat of disease. To attack it was to attack the citadel of the cancerous tumor. In her brief but crisp dissertations upon the care of the blood in the treatment of malignant difficulties, I was reminded of the celebrated Boyle, who said: "To neglect the condition of the blood for that of the solids is like the vintner looking after the structure of the cask and forgetting the wine." Our standpoints of professional experience and emotions were, of course, quite different, and, as a consequence, our thoughts ran out in entirely different channels during our conference. She seemed to feel herself the bearer of glad tidings to the suffering and the hopeless, which added to the potency of her manner.

Her denunciations of the cruelties of surgery in the treatment of cancer caused the vital tide to almost rush back under my heart, recollecting as I did that, under cover of my diploma and the broad license of my profession, I had labored for 14 years as an active associate in

her words of "human butcher," in the vain attempt to ameliorate the condition of cancerous victims. I must confess that while standing in her presence, listening to the narration of her many successes, won without pain, and at the same moment allowing my mind to run back to the vivid and depressing scenes of agony and of blood, which, like so many ghastly figures, lie eternally imprinted upon the web of my own professional life, I felt not a little disturbed, and thought that after all I was, with all my cherished honors, no more, perhaps, in the cancer ward than a simple adept in the "art of mutilation."

Since then I have spent no little time in reflecting upon what I heard from the lips and saw at the hands of this earnest worker in the realm of medical science; and comparing this with the teachings of the schools, and the well-known results of the knife as a remedial agent in the cure of cancer, I have almost come to the belief with her that the use of this instrument in its treatment should be held as a criminal act in the eyes of the civil law. And why should it not when scarcely one—ah, me, not one!—in truth is cured in clearly defined cases.

What a subject for reflection to witness the surgeon coolly preparing to mutilate the person of the cancerous victim, when he knows with certainty that 99 out of every 100 must pass unscathed from his hands to the grave, and that too often much sooner than if left to the mercy of the disease.

Think of a surgeon after grasping with a nervous grip his ample fee of gold, severing with his knife from the body of a delicate woman an entire breast for simple inspection under the microscope that he may determine whether the organ was really affected with cancer or not. Strange as this may appear to the novice, it is, nevertheless, a fact of history distinguishing the profession not only in the city of San Francisco, but in some older centers of medical skill and science to be named. And is this quackery? To call it so would be vehemently resisted by both operator and school to which he may belong. The layman, however, of sound judgment could not only denominate it quackery, ignorance, brutal experiment, but an act of malpractice that should incarcerate the surgical charlatan in the State penitentiary for the balance of his natural life. Consideration for the suffering, a careful avoidance of all unnecessary pain and discomfort to the sick, is one of the sacred requisites of the calling of the physician; and he who disregards this discredits the profession, and yet how often is this to be found in the history of the medical practitioner. And now what are the logical conclusions to be drawn from the foregoing illustrations of an endless catalogue? Can it be that in cases of cancer particularly, gold is the inspiration of surgery; or is it fame, or is it to gratify a brutal instinct in the name of science? It certainly cannot be science, nor conscience, nor any sentiment that belongs to a human heart. The history of surgery furnishes abundant evidence that the knife in many instances is the one great means relied upon for professional distinction. Novalis said Spinoza was "intoxicated with God;" so it may be said of many surgeons, that they are drunk with the knife of mutilation, especially in the cure of cancer. I was informed, while in San Francisco, whether true or not, that a certain female practitioner in your city, taking her cue, seemingly, from the reckless surgery of battle-fields, was laboring to establish a great reputation through the use of the knife, when poultices or resolvers would much more accord with science and common sense.

But by what authority, it may be asked, do I assume to become a critic of the medical profession, and especially of cancer surgery? I answer, by authority of experience, science, and humanity. Paul, the fiery advocate of the Jewish hierarchy, was finally chosen of God to expose its errors and hypocrisy. Luther, a Romish priest, was the man best fitted to arraign the church for impeachment. The nihilist, feeling the iron hand of the Czar, can best lay bare the cruelties of despotism. Oliver Wendell Holmes, by virtue of his profession, was eminently qualified to arraign on the lecture platform the medical practitioner for nonprofessional practices. Dr. Faustus, by Goethe, says: "Thus with our hellish drugs, death's ceaseless fountains,

In these bright vales, o'er these green mountains,

Worse than the plague we raged!

I have myself to thousands poisons given, And heard their murderer praised as blessed of heaven,

Because with nature, strife he waged."

And having had myself, for 14 years, a cancer ward of one of the great hospitals of England, I feel that I am in no way guilty of egotism in condemning the use of the knife as a remedial agent in the cure of malignant tumors. I reverently wish to God that it use in my hands as a specific for cancer could be blotted from my professional record. Its memories are harrowing. Like some unseen but living thing, it is constantly filling my ears with the moans of the suffering, and my vision with the apparitions of blood and of human mutilation; and yet all this was done in the name of science! But surely science, as defined by the schools and applied to the treatment of cancers, needs a new and a more truthful rendering.

I hope to return to your city in the course of another year; then I shall endeavor to follow up my investigations in the line of cancer treatment to a satisfactory conclusion. In the meantime I hope for humanity's sake that the new treatment will have so far triumphed over error

and misrepresentation that all dogma and professional jealousy will have been buried in depths whose chambers shall be beyond the reach of the mighty trump of resurrection.

MEDICO ON THE WING.

USEFUL INFORMATION.

IMITATING LEATHER SURFACES.—By means of electricity the most attractive leather surfaces are now completely imitated. The leather which it is desired to imitate is first well cleaned and coated with graphite, as in electroplating a smaller article. It is then placed in a copper bath, the tank of which is large enough to easily receive a skin of any size. A dynamo-electric machine generating a powerful current furnishes the current. The copper is deposited upon the coated surface of the hide to the thickness of one-sixteenth to one-eighth of an inch. The plate thus formed reproduces, but reversed, every mark and minute vein of the leather, so that a print taken from it is an exact copy of the original in every detail.—*Unknown Source.*

COCOANUT CELLULOSE is a new substance, and if it possesses the quality claimed for it, England may go back to her wooden walls with safety and beat up her self-destructive rams for old iron. The patentees claim that a ship cannot be sunk by shot or shell if only she has taken the precaution of coming into the fight with this peculiar tissue as a great coat. When a shot, no matter what its dimensions, strikes the side of a frigate, the carpenter and his mates need not jump to cram in the old-time plugs, for the cellulose immediately closes, and a drop of water cannot enter.—*Baltimore American.*

TEMPERINO STEEL.—A practical writer says: When we were much younger than we are now and the zylonite clearing on top of our head hadn't acquired such heauteous proportions, we had to temper up a lot—yea, verily, many lots—of steel tools, and here's the "great secret" we used: We got a "clush-bucket" and washed it out clean, then weighed out one ounce corrosive sublimate, put in two handfuls common salt and stirred it up with two gallons rain-water, heated the tools in hot lead and hardened in this liquid and drew over a charcoal fire. A tool never broke.

DISINFECTING RAGS.—All rags sent to New York are disinfected in the following manner: The rags are arranged in bundles and placed in an impermeable receptacle, into which superheated steam is introduced (330° F.). In about five minutes the temperature of the bundles is so high that in two hours it does not fall below 100°. The experiments that have been made prove that this process destroys completely all germs contained in the rags, whereas sulphurous acid is not so successful.

WORK OF A PUMP.—The amount of water a pump will throw equals the displacement, i. e., the area of the plunger multiplied by its stroke in inches. Multiplied by its number of strokes per minute, this divided by 231 (cubic inches in a gallon) will give the duty in U. S. gallons, always presuming the water cylinder to be completely filled and emptied at each stroke, a condition that rarely occurs.

SODA AND POTASH SOAP.—The hard soda soaps are preferable to the soft potash soaps for toilet purposes. The quality of soaps depends upon the character of their constituents and the thoroughness of their saponification. Good soaps must not contain free alkali or any foreign irritating substance. The addition of moderate quantities of perfume does not materially change the quality.

LIGHT.—In transmitting light through glass, colored glass acts like a screen and sifts out and absorbs or reflects all the rays except those that will pass through it. Those that do pass are simply those which correspond to the color of the glass. The true color of a body that transmits colored light is the complement of the light which it transmits.

GREEN VARNISH FOR METALS.—For a green transparent varnish for metals, grind a small quantity of finely powdered chromate of potash (it requires the most elaborate grinding), add a sufficient quantity of copal varnish thinned with turpentine. The tone may be altered by adding more or less of one or the other ingredient.

GLOSSY INK.—Any common writing ink can be made glossy by adding to it a little gum arabic or white sugar. If the latter is used care must be had not to use too much sugar, else the mixture will be sticky when dry, and if too much of either gum or sugar is used the ink will become too thick to flow well.

TO KEEP BRASS BRIGHT.—To keep highly polished brass absolutely bright and free from tarnishing, thinly coat with a varnish of bleached shellac and alcohol.

GAS ROSIN.—You can make your own gas-fitter's cement thus: Melt up 4½ lbs. rosin, 1 lb. beeswax, and stir in 3 lbs. Venetian red; it will hold gas in.

SERPENT SKIN is coming into fashion as a covering for books.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

RICH ORE.—*Ledger*, June 11: On Saturday morning last a blast was put into the tunnel of the Valparaiso mine near Middle Bar, at a point where the seam of rich ore was known to exist, and five tons of fine rock was blown out by a single blast. The ore shows considerable free gold, and is plentifully freighted with that gold-bearing black metal peculiar to that district. A piece of quartz weighing 400 pounds was shipped to S. F. to parties interested in the bond. There is abundant reason for believing that the mine contains vast quantities of the same kind of rich ore. The Gold Mountain mine at Quartz Mountain is again under attachment. The North Star Improvement Company has levied assessment No. 1 of two cents per share. It is the intention to levy an assessment of a like amount every two months. Col. Robertson is getting some excellent ore from the Cleveland mine, a short distance above the Big Bar bridge, on the Amador side of the river. Dr. Boyser of San Francisco, who is one of the stockholders of the Kennedy mine, is fixing up an apparatus for the purpose of extracting the sulphurets and gold-bearing slime from the tailings. It is an entirely new process from those heretofore used in this county. The process was tested for the first time Thursday, and is said to work admirably. The contrivance is very simple, and involves little expense. Considerable gold escapes the Kennedy mill through the black slime, and this invention is intended to curtail the loss if possible.

FROM SUTTER CREEK.—*Cor. Ledger*, June 11: A noticeable change has taken place in mining affairs on Mahoney bill. The Mahoney mill has come to a standstill, and the Lincoln, which has been idle for a short time, was started up this week. Mr. Clavorn, as agent for the absent stockholders in Scotland, assumed the authority to give the Mahoney Company a lease of the water in the Lincoln ditch, which authority Mr. Stewart questioned. As soon as he was ready to use the water, Mr. Stewart applied to headquarters, with the result that the use of the water was restored to him. In this state of affairs it is uncertain when the Mahoney will be able to resume operations. They are still making excellent progress in draining the Wildman shaft; some days the water is lowered as much as 24 feet. Some timbers have been delivered at the mine this week. Donnelly & Howard have got a contract to put up hoisting works at Graniteville, Nevada county. The works are to be erected 400 feet underground.

Calaveras.

RICH ROCK.—*Chronicle*, June 11: We were shown some fine specimens of rock from the Quaker City mine near "the junction," one day this week. This mine had been idle many years, but upon the resumption of work a little while since it is developing some very flattering prospects.

ORE.—*Mountain Echo*, June 8: According to report a large body of good ore has been discovered in the Tozer mine in this town, and everything now indicates that this mine will soon become a paying property. The improved Low crusher is being used to reduce the ore. We were shown a specimen of quartz taken from the Johnson mine, situated near Albany Flat, which, to say the least, is exceedingly rich. The shaft is now only 20 feet deep, but the vein has developed into an apparently permanent ledge six feet in width. The ore shows free gold and contains a high grade of sulphurets.

Del Norte.

BEACH MINES.—*Record*, June 11: Almost ever since the settlement of this county it has been well known that the beach below town was rich gold-bearing sand. The first effort made to work it was, if we remember rightly, about the year 1857, but the effort, from the manner of working adopted, proved a failure. Here the matter rested for a few years, when some parties from Gold Beach came down and tried their system of working by using copper plates, which proved successful beyond their most sanguine expectations. Chas. Brown and Thos. Bisbee continued to work the beach sand for a number of years, taking out many thousands of dollars, but on account, we believe, of having some trouble about the title of the property, they abandoned their claims. They were satisfied, although they took out a great deal of money, that much of the very fine gold was lost, and since that time several patent machines have been brought to the place and a trial made with them, but all have proved unsuccessful. The trouble has always been that not enough sand could be run through these machines, even if all the gold was saved to make it pay. No doubt there is as much gold in the beach sand now as there was 30 years ago, as every tide washes up the gold-bearing sand; and if a machine could be invented that would save the gold and at the same time a large quantity of sand could be worked, it would be one of the best paying investments that we know of in this section of the country.

El Dorado.

HENRY'S DIGGINGS.—*Cor. Mountain Democrat*, June 11: Armstrong & Roberts report having in their tunnel some of the hardest rock in El Dorado county. Millgate and Tom Daley will again be with us soon, to resume work on their quartz mine. The Carrie Hale Company has plenty of water in its ditch, and is getting some good pay out of its claim. Mr. Alexander reports getting along well in the Crystal mine.

Nevada.

A RICH STRIKE.—*North San Juan Times*, June 11: At the Delhi mine, on Friday last, rock was struck that is estimated by quartz experts will mill \$20,000 per ton. Two blasts were made into the vein, or lode, and nearly a ton of rock was loosened, all of which is of this rich character. We saw a piece of the rock which weighed 2½ pounds, and in which quartz was the exception and gold the predominating commodity. We saw other pieces that were literally covered with fine gold, and we were assured that the pieces shown to us were taken from the mass hap-hazard. This rock was taken from the stoping between the 300 and 500 foot levels. This strike places the Delhi in the front rank of quartz mines in the State, and establishes its char-

acter beyond a doubt. In the month of April, the yield of gold was sufficient to pay all the expenses of working the mine and to pay a dividend of \$70,000 to the stockholders. The production for the month of May was \$27,200—nearly double that of April, and if the rich rock we have described holds out, the receipts for the month of June will be almost fabulous. The \$27,200 receipts of last month were obtained at an expense of only \$1400. That is about the average cost of running the mine for one month.

NEW QUARTZ LOCATION.—*Grass Valley Union*, June 11: John Riley, Henry Shoemaker, and three other young men have recently located a quartz lode to the southwest of the North Star mine, which was formerly prospected somewhat, but not to a great extent. They have let a contract to run a tunnel 100 feet on the ledge, which is now in some distance, and shows a vein from two to three feet in width, which has the same appearance as the North Star quartz. The boys are feeling very good over their prospects, and have had offers to purchase their interests at figures that would pay them well above their investment, but they are in no disposition to sell. They can avail themselves of the benefit of the water that is used at the North Star mine for any machinery they may require, as the location of the ledge is at a lower altitude.

Mono.

BENTON ITEMS.—*Cor. Inyo Register*, June 9: There are more men at work on Blind Spring hill, and more ore being taken out, than there has been for several years, and prospects are encouraging. Last week M. Harrington and James Hoskins shipped a carload of high-grade ore, and the week before John Kremkow and James McClure shipped a carload each. J. F. Milner has about 15 miners employed at the Borrasco, and has a large quantity of ore on hand at the mill. He expects to start up the mill in a short time for a profitable run. Cal. Joy, who has a lease of part of Tucker & Mitchell's mine, has taken out 25 or 30 tons of rich ore, and still has more in sight. Geo. Watterson was in town the other day. He says the prospects of his gold mine, near Long valley, are very promising.

Placer.

A BIG FIND.—*Placer Herald*, June 11: We learn from J. B. Hobson, who was in town Monday, that gravel has been struck in the Red Point mine about a mile above Damascus. This claim is owned by the Golden River Mining Co., C. F. Hoffman, superintendent. In August last they started their tunnel with Burleigh drills and have progressed with the work continuously since. When in 2200 feet they raised for the channel, and on the first of this month, when at a height of 105 feet from the tunnel, they cut through into black gravel, and are confident they have struck the same black or blue gravel channel that has proved so rich in the Damascus or Mountain Gate mine, and which they were running for. It has been a question as to whether the Damascus channel extended in the direction of the Red Point. The Golden River Company believed it did and put up their money to test their theory, and their success is not only a confirmation of their judgment, but it opens up what bids fair to become one of the great paying mines of the State. The same channel below them has yielded at the rate of about a million and a quarter dollars to the mile, and the Red Point claim covers about five miles of the channel. This development will give a new impetus to mining in that section, and prove a good thing for the county.

DAMASCUS.—*Placer Argus*, June 11: Good pay is again being taken out of the Mountain Gate mine. Twenty-seven men are now employed at the Pioneer ledge, in Black canyon, above Damascus. The blue lead has been reached at last in the Red Point mine, four miles above Damascus. The mine has been, for many months, bonded to the "Societe Anonyme," etc., commonly called the French company. Messrs. J. B. Hobson, G. W. Snyder and F. D. Adams are the owners of the mine.

Plumas.

CRESCENT HILL.—*Plumas National*: Frank Vere informs us that he commenced work again this week on the Crescent Hill mine, east of Clernont. Frank has been holding on to this claim for the last eight years. He has a tunnel in 450 feet through hard rock and has just struck gravel, with quite a flow of water, which is a sure indication that he is in the old channel. He deserves a fortune for his pluck and energy in pushing the work as he has, under adverse circumstances.

SPANISH RANCH.—*Cor. Plumas National*: Mining is carried on quite extensively in a small way. Hydraulic mining has been superseded by retroversion, and the ancient modes of mining are again in vogue. It is truly pitiable, in many cases, to see those old "Argonauts," now stiffened and crippled with rheumatism, standing all day, knee deep in the ground-sluice, picking down the banks, which, before injunctives were served, they washed with their small pipes in comparative dryness. These cases are truly illustrative of "man's inhumanity to man," add Utah.

CLIFTON DISTRICT.—*Salt Lake Tribune*, June 11: Clifton district, near Deep creek, Utah, has 18 claims recorded, in some of which Governor West and others in this city are interested. This district is new, having been lately organized. Messrs. Martin and Woodman have seven or eight claims here, some of which they are working; the district carries gold, silver and lead. Mr. Woodman showed assays from their claims which gave respectively in gold, \$750, \$94, \$80, \$60, \$59, \$18 and \$10. Lucky Jim is a new prospect belonging to Martin & Woodman, showing assay of 19 ounces silver, 26 per cent lead and \$3 in gold, while the Maggie, also new, shows 52 ounces silver and 54 per cent lead in the four-foot vein. These men report the country rock as being granite and lime, part of the latter being dolomite, and say: "If the district was as favorably situated as Bingham it would soon ship a thousand tons of ore per day." Ferber is 35 miles from Deep creek and is very similar to Clifton, and has plenty of wood and water for mining. Assays of ore from Ferber show 35 ounces silver, 30 per cent lead and 30 per cent iron. Smelters are running at Sprucemount, and there is need of a smelter where it can be easily reached from Clifton. Ferber and Kinsley is another promising district where there is lead, silver, gold and copper. M. H. Lipman and other citizens of Salt Lake are interested there and have made some shipments of ore. Mr. Chisholm

says of Tybo and Kinsley: "I never saw a district where there was so much ore on the surface. The whole surface is covered with float, and one large boulder was rich ore." Deep creek and these other districts are near the Nevada line, a little south of west of this city.

San Bernardino.

MILL LEASED.—*Calico Print*, June 11: E. J. Murray, superintendent of the Odessa Mill and Mining Co.'s property, recently leased the company's 15-stamp mill at Hawley's. Geo. Dessalier, the foreman of the company's mines in East Calico, has obtained a lease on the Odessa mine, and henceforth the company will not operate their mines themselves, but will lease their properties to choloriders. The prospects of Messrs. Murray & Dessalier doing a profitable business from their leases are good.

Sierra.

SIERRA CITY.—*Mountain Messenger*, June 11: H. Rich & Co. have been awarded the contract at the Parker mine, at Gold Lake, to run tunnel No. 2. This mine is owned by a number of gentlemen from Sierra valley. Tunnel No. 1 was run some time ago to strike the ledge, which prospects very well. Supt. Bacon was in town Monday. The company will build a mill this summer. Pay-day at the Sierra Buttes on Monday, and the town was full of men. The snow is about gone between this place and the Gold Valley mine and work is being rushed. There is a great demand for carpenters. The company propose to build a large boarding-house, office, mill and chlorination works this summer, and will also continue opening the mine.

PROSPECTING.—Reports are to the effect that the Delhi Co. is prospecting the General Grant mine, below Pike City, just across the Yuba, in this county.

Siakiyou.

ORO FINO.—*Yreka Union*, June 9: There have been some more new discoveries in quartz. Under the Eastlick placer mine a large ledge has been found which prospects remarkably well. Gilmore & Son of Hull gulch have struck rich quartz in their mine and will probably make a good season's clean-up. They are enterprising men and richly deserve it. The water supply has again failed and only one company can run at a time. The scarcity of snow points to this state of affairs the season through. Campbell & Co. have quite a crew of men and are making good use of the water while it lasts. All the mines will be through by the 4th of July, making an unusually short season.

Tuolumne.

BUCHANAN.—*Tuolumne Independent*, June 11: New machinery has gone up to the Buchanan mine, and more has been contracted for. At the 600-foot level the mine looks better than ever. Quite a little town has sprung up at this place. Neat cottages have been erected by the company, which the men are permitted to occupy at a small rental, and a store has been stocked, where the workmen can purchase all their supplies at as cheap a rate as from outside places.

LONG GULCH MINE.—*Union Democrat*, June 11: This mine, near Summersville, is one of the old locations of the county. A shaft, 75 feet deep, was put down on it some 20 years ago, proving the good size and value of the vein. Work was suspended because of the strong flow of water. The means of the owners at that time to control the water being limited, they abandoned the work. The present owners sunk a shaft on the southern portion of the mine last year to prospect the vein at that point, and being satisfied with the result, have now secured substantial steam hoisting works, and started a shaft at a point intermediate between the two shafts mentioned, and have sunk it to a depth of some 80 feet, and are driving it down rapidly. They have a strong two-foot ledge at this depth of good ore, and the prospect promises the making of a valuable mine.

BUCHANAN MINE.—Mr. McCaw, a mining engineer from London, and his brother, a practical miner, are now at this mine inspecting it for report to be made to foreign capitalists for purchase, if found satisfactory to them.

Trinity.

ENTERPRISE.—*Trinity Journal*, June 11: Mr. Wm. Leavitt returned from East Fork this week, and reports everything progressing finely on the Enterprise mine. Their new prospect is improving as they sink on it, running from 7 to 14 inches, and nearly all the rock showing free gold. The arastra is running constantly.

EASTMAN'S GULCH.—From Mr. C. L. Blake, we gather the following items relating to Eastman's gulch: The mill on the Venicia mine started up the first of the month on ore from the mine; the mill has a capacity of about 15 tons a day. From all reports the ledge is looking first-rate. The company is building a wagon-road from the mill to tunnel No. 4, and expect to finish it this week. They have run in tunnel No. 4 to a distance of 500 feet, and are pushing it ahead as fast as possible. In the Nob mine, Jas. Fisher has about connected his upper and lower tunnels by a raise; he has now out about 80 tons of fine-looking rock, a part of which he is crushing in the Venicia Co.'s upper arastra. John N. Ames recently found a new prospect between Hickey's and Hamilton's mines, on the extension of the Golden Gate. The ledge shows up from three to four feet in width, broken, and not as yet well defined, but shows every indication of leading to something good. He has traced the vein on the surface for a distance of 150 feet; the rock shows free gold and carries galena sulphurets. Dan Kitchen, who recently leased the First Chance mine of Mrs. J. M. Blakemore, has a very good prospect. He has a ledge of 75 rock which he has followed in about 20 feet, taking out ore as he goes, and which he will crush in the lower arastra. C. Hickey has opened up the old vein in his mine in a new place, and is now engaged in sinking a shaft on it.

NEVADA.

Wahoe District.

CON. CALIFORNIA AND VIRGINIA.—*Enterprise*, June 11: On the 1300 level a west crosscut (No. 2) from the south drift was advanced 40 feet; total length, 203 feet. This crosscut is still showing quartz and vein material. Good progress is making in the raise that is being cut out from the northeast drift up to the 1200 level for the promotion of a circulation

of air at this point. On the 1400 level west crosscut is still passing through vein material of favorable appearance. The north drift, started from the bottom of winze No. 1, has been advanced 40 feet; total length, 130 feet. Streaks of good ore continue to be encountered in this drift, and the whole face is in low-grade ore. Are still extracting ore from the new south stopes on this level. Though the bulkhead portion of the mine is supposed to be filled in every part with carbonic acid gas, that gas is still being injected to keep up the pressure and density in the parts in which was the smoldering fire. In order to make a sure job of it they will continue to inject the carbonic acid gas for some time to come. The usual amount of ore has been sent to the river mills.

HALE AND NORCROSS.—On the 5th station level the north drift has been advanced 25 feet, and No. 2 east crosscut from this drift was extended 28 feet, the last 8 feet being in quartz which gives low assays. The opposite crosscut from this one (No. 2 west) was advanced 25 feet. In the south drift on this level, 60 feet back from its face, have drifted on the ore strata 45 feet east and west, and have discontinued work for the present. East crosscut No. 1 on this level has been advanced 35 feet, and is now 155 feet east from the south lateral drift. Its face is in clay and porphyry, showing some water.

GOULD AND CURRY.—On the 250 level the two west drifts still continue to show some ore of a fair quality. On the 625 level the east crosscut from the main south drift was advanced 35 feet; total length, 383 feet. The face is in soft porphyry, showing clay slips. From the bottom of the winze the east crosscut was advanced 25 feet; total length, 60 feet. The face continues in quartz. Some small stringers of ore are beginning to appear in this quartz.

YELLOW JACKET.—Are taking out 165 tons of ore a day. This ore is being worked at the Brunswick and Vivian mills, Carson river. A part of the Brunswick mill is at present running on Overmou ore, but the Jacket folks will soon have the whole mill, when they will let go their hold on the Vivian.

HENDRICKS.—Machinery being overhauled preparatory to resuming work in the bottom of the shaft, and extending the east crosscut at a depth of about 500 feet, from which good assays were obtained when the last work was done. Col. S. T. Curtis has been appointed superintendent, and has taken charge.

ANDES.—A north drift has been started from the bottom of the winze at a point 60 feet below the 240 level. The drift is out about eight feet. It is in quartz carrying some ore of low grade. The west crosscut on this level, 75 feet north of the winze, is making good progress. The face is in vein material of a favorable appearance.

IOWA.—All the ore-producing sections of the mine are looking well. All defects in the milling machinery have been remedied, and the bad shoes and dies replaced. The mill is now running continuously and doing good work. The outside copper plates are showing amalgam in considerable quantity.

BALTIMORE.—The upraise from the 300 level is showing well in ore of a good quality. The drifts north and south along the vein on this level are making good headway, and crosscutting from them will soon be in order. On the 400 level a considerable amount of good milling ore is being extracted.

ALTA.—On the 825 level are drifting north. The drift is cutting streaks and bunches of pretty fair ore. Have commenced sinking a winze in the south drift on this level. The bottom is in very fair ore. On the 725 level are running south. The face of the drift is showing ore of a very good grade.

HAYWOOD.—The Thompson mill is kept steadily running. All the ore-producing sections of the mine are looking well. The company is likely soon to perfect arrangements for additional milling facilities. They have ore enough in sight to run half a dozen mills right along.

NORTH OCCIDENTAL.—Are arranging to work through the Occidental mine; also, arrangements are being made whereby they will work through the Suro tunnel at a depth of 1300 feet, in conjunction with the Occidental, St. John, and other companies to the southward.

CROWN POINT.—The usual amount of ore is being extracted and sent to the mills on the Carson river. A good deal of prospecting is being done, and some good ore was found between the 300 and 400 levels. The work of exploring the ore deposit found is still continued.

CHOLLAR.—Good headway is making at all points where drifts and crosscuts are being run. No ore is being extracted, but a considerable amount is being opened up in the several levels from the roots of the sagebrush down to the 1300 level.

LADY WASHINGTON.—On the 725 level are drifting north. The whole face of the drift is in ore of a fair milling grade. As no crosscut has been made, the width of the deposit is not known, but it is seen that it is much wider than the drift.

UTAH.—On the 472 level, the north drift from the main west drift was extended 20 feet; total length, 784 feet. The face still continues in vein porphyry, passing through clay slips, and is showing moisture.

SIERRA NEVADA.—On the 520 level, east crosscut No. 2 started last week, from the main north lateral drift, at a point opposite west crosscut No. 9, has been advanced 25 feet; total length, 51 feet.

BELCHER.—Are still taking out about 100 tons of ore a day, which is being worked at the Santiago mill, on the Carson river. A considerable amount of prospecting is in progress at several points.

SCORPION.—The east drift on the 300 level has been advanced 25 feet. This drift is now out a distance of 677 feet east from the shaft. Its face is in soft vein porphyry and clay slips.

BEST AND BELCHER.—On the 800 level west crosscut No. 4 was extended 20 feet; total length, 486 feet. The face is in porphyry and quartz, showing value by assay.

OPHIR.—On the 1300 level north winze No. 1 was sunk and timbered 10 feet; total depth, 55 feet. The bottom is still showing fair grade ore in streaks and bunches.

SAVAGE.—On the 500 level are repairing the various drifts. The west crosscut from the 8th floor above the 600 level has been extended 24 feet, and its length is now 69 feet. The east crosscut from the 5th floor of the same level has been extended 27

feet; total length, 93 feet. On the 600 level No. 6 west crosscut was advanced 21 feet; total length, 213 feet; and the south drift from this crosscut is now extended 25 feet into the quartz body.

Esmeralda District.

A PLACE FOR A BIG MILL.—*Esmeralda News*, June 11: As must be apparent to any person who has ever visited the mines at Aurora, and as a matter of fact, there are thousands of tons of low-grade ore in that camp awaiting reduction. The lack of milling facilities at small cost is the reason this great mass of ore has accumulated. Now to effect the reduction of this ore and to make the camp a big one and one of large profit to the owners of the mines in that district, a large mill should be erected so as to economically work the ore. At a point on the Walker river, a distance of about 16 miles from Aurora, is a splendid site for such works; water can easily be obtained from the river to run a mill of any size, which, therefore, insures cheap facilities for reducing the ore. From the mines to this point there is a good wagon-road nearly all of the way, but, in keeping with such immense reduction works as are necessary to handle the enormous amount of low-grade ore, a narrow-gauge railroad can be easily built; that is to say, at a comparatively small expense. The grade from the mines to the proposed mill-site is a descending one. The country is well supplied with timber.

Eureka District.

MINES THAT WILL PAY.—*Eureka Sentinel*, June 11: The necessity for capital to develop our mines is felt in Eureka. The cost of mining and smelting our ores is remarkably lower than it was in years gone by; yet our camp with its splendid opportunities for the investment of capital is disregarded, while worthless properties in other districts are easily marketed. We have about 300 mines in Eureka district that would produce ore, but three-fourths of these are lying idle, because the owners have not the means to buy the machinery that will be required to work them. Many of our old-time prospectors, who have developed their mines from the grass roots, are compelled to stop work for want of the machinery needed to develop at great depth. Those who are seeking after good mining investments should quietly drop into Eureka and see for themselves what the chances are.

Gold Run District.

FINE ORE.—*Silver State*, June 13: The Great Republic and New Star Con. Mining Co. has struck a fine body of rich ore in one of its mines in Gold Run district, east of Golconda. The company owns two mines, which adjoin each other, one of which is named Great Republic, and the other New Star. In the latter, at a depth of about 15 feet from the surface, they have four feet of solid ore, the greater part of which assays from \$80 to \$200 to the ton. A few days ago they took out a block of this ore that weighs over 200 pounds. The company's prospects are very bright, and it is probable that reduction works will be erected at Golconda to reduce the ore.

Hawthorne District.

BULLION SHIPMENT.—*Esmeralda News*, June 11: The Lapanta company worked a small lot of low-grade ore at the Moss mill, as an experiment, and yesterday shipped, per Wells, Fargo & Co.'s express, a three and a half pound bar of gold bullion, valued at \$1000.

Mt. Rose District.

THE PARADISE MINE.—*Silver State*, June 11: A private letter received by J. H. MacMillan, from Spring City, says the prospects of the Paradise mine have greatly improved within the last few days. There is now from 10 to 12 feet of good ore in the Wild Goose stope, and there is a decided improvement in some of the Paradise levels and stopes.

Mt. Hope District.

THE BATCHELDER MINE.—*Eureka Sentinel*, June 9: The Mount Hope mines embody a belt of mineral ores of silver, lead, and zinc. The Batchelder mine is a lode of the greatest magnitude we have ever seen. This lode has been explored to a depth of about 150 feet and has been drifted on in different directions for several hundred feet; yet to it there is neither sides nor bottom. The mine looks best where it is the deepest, for there it is that the ore is rich and permanent looking. Prof. Price appeared to have been surprised at the magnitude of the lode and expressed a very favorable opinion of the property.

Pioche District.

PIOCHE CON.—*Pioche Record*, June 6: W. S. Godbe, manager of the Pioche Con. Co., arrived Sunday last from Salt Lake City. Through the efforts of Mr. Godbe the Pioche Con. property has been put on a basis for starting up, and we understand that shaft work—that of retimbering for the purpose of getting to the bottom of the old Raymond & Ely shaft—will be commenced immediately.

Trinity District.

A MILL.—*Cor. Silver State*, June 9: Lordocks is filled with mining men who are willing to take hold of prospects to develop an industry paramount to all other business in the Silver State. Several men of means and sense, among them Mr. Prince and Mr. Ogg, of Garfield district, are here inspecting Trinity district. The chances are very favorable for a sale, when a mill will be erected somewhere close to Oreana, and the old stamping-ground will once more breathe the breath of life.

Tuscarora District.

COMMONWEALTH.—*Times-Review*, June 10: Shaft has been sunk 19 feet, work is being pushed as fast as possible. Northwest gangway, 300-foot level, has been advanced 35 feet.

BELLE ISLE.—East crosscut, 250-foot level, has been extended 68 feet. Fair progress in line crosscut, and north drift from same, on the 150-foot level. The workings are in very hard rock.

GRAND PRIZE.—New gallow-frame was completed on the 7th. Started the hoist the day following, and put men to work in the shaft cleaning it out, and replacing broken lagging and timbers, which will require about a week's time.

NEVADA QUEEN.—Shaft has been sunk 18 feet and connection made with 350-foot level. Station is being cut out and timbered.

NORTH BELLE ISLE.—North gangway, from south

end line, 400-foot level, has been extended 20 feet. We are now within a short distance of the shaft, with which a connection will be made by an upraise from this level, to drain the water, then the shaft will be sunk and timbered to the 400-foot level. Work on the foundation for the new hoist will be commenced next week.

DIANA.—Everything will soon be in shape to resume work on the 200-foot level. A crosscut has been started east from the 150-foot level of the North Belle Isle.

NAVAJO.—South drift, west vein, 150-foot level, has been extended 8 feet. South drift from Johnson crosscut advanced 12 feet. South winze on east vein has gained a depth of 100 feet. The setting of the large pump and other work at the pump station on the 350-foot level will be completed in a few days.

ARIZONA.

BRADSHAW BASIN.—*Cor. Prescott Courier*, June 2: The section of Yavapai county thus designated is about 40 miles south of Prescott, at the head of Black Canyon creek and at the foot of the great Bradshaw range of mountains. The Basin is well timbered; grass and water are abundant. Near it are the Tiger, Oro Fino, Gray Eagle, Cougar, and many more rich mines of gold and silver. In selecting properties here, Mr. Jos. Reynolds (Diamond Jo) struck his stakes in Del Paso mountain, a little north of the Basin, and he is now expending large sums of money in opening mines and putting up reduction works. Mr. O. F. Place, general manager for the Moody & Place Mining Co., of Bradshaw Basin, is also developing properties. Selecting two or three good-looking ledges, he tested them pretty thoroughly; they stood tests and he soon after secured U. S. patents to them. His principal mine has yielded, by milling tests, \$25 and \$80 per ton, gold. The vein is large and well defined. Some seven months ago, Mr. Place became aware of the fact that it was a wet mine; water, in large quantities, bad to be hoisted from the bottom of the shaft. Then it was that he conceived the idea of tunneling, so he let a contract to run a 250-foot tunnel to tap the ledge, he agreeing to pay for said work at the rate of \$10 per foot. Mr. Place will now crosscut to what he calls an upper ledge, but what is, we believe, the mine in higher ground. When this crosscut shall have been made, he will have a 350-foot tunnel in a great vein, and will have gained a depth of 250 feet.

MOHAVE NOTES.—*Miner*, June 11: A carload of C. O. D. ore was put through the sampling works on Tuesday, and another on Wednesday. Superintendent Mackenzie had a carload of ore from the Cupel mine worked this week, but the assays have not yet been received from Prescott. Mr. R. S. Williams, a mine-owner and capitalist of Providence district, across the Colorado, brought in six tons of very rich gold ore on Wednesday, and had it sampled. Mr. Howell tells us that the carload of lead ore from the C. O. D. mine, worked this week, sampled 111 ounces in silver, which is twice as much as any previous lot of lead ore which was ever worked from this mine. The returns from the high-grade ore have not yet been made. Fourteen tons of rich ore was hoisted from the Keystone mine, Mineral park, last Saturday. We hear this morning that the lessees have made another rich strike, but have been unable as yet to learn its extent. Mr. Dennis tells us that ore is coming in very slowly to the sampling works on account of scarcity of pack trains. This should not be the case, as the mines are taking out more ore than ever before in the history of the county, and the dumps are crowded with ore sacked up ready for the packers. Whoever will bring 50 or 100 pack animals to Wallapai district can get steady work for them for some time to come.

IDAHO.

THE JUNCTION COMPANY.—*Wood River Times*, June 8: George W. Paylor, superintendent of the Junction Mining Company, arrived to-day from San Francisco. The first move he will make will be to call for proposals to sink a double compartment shaft on the Junction claim.

ANOTHER MINE ON DEER CREEK.—The Emery mine, on Deer creek, is opening out splendidly. The ore vein now shows up two feet in width, and is exposed a length of fully 60 feet. The ore is high grade, and parties who have visited the mine say that it promises to be fully as good as the Idahoan.

CAMAS TO THE FRONT.—I. S. Waring thinks that he has found the continuation of the Gold Belt on Elk creek, about five miles from Crichton, Camas Prairie. Himself and his partner, Corcoran, have located claims called the Fanny Waring and Pride of Camas, on a vein which shows nine feet in width of rich ore that assays from \$41 to \$233.08. Six assays were made of rock taken along the ledge. A new mining district is to be organized there soon.

CLOSED.—*Idaho Avalanche*, June 11: The De Lamar mill is now closed down for a few days, but will start again as soon as the cleanup of the 100 tons of Wilson ore, just reduced, is made. The lode recently discovered by Messrs. Sullivan and Phillips, on Florida mountain, is being developed into a large and rich lode. A shaft is now being sunk in rich gold ore. The width of the lode is not yet known, but from the large boulders of quartz taken out, it is probably five or six feet wide. The discovery was made under the old Black Jack orchard, and the lode is supposed to be the one that fed Coffee gulch with rich placer gold.

MONTANA.

BUTTE NOTES.—*Miner*, June 8: Much prospecting and taking out of ore is being done on the Ore Butte. At No. 1 shaft they are down a depth of 40 feet. Eight different assays return an average of 48 ounces per ton. Messrs. Hammer & Dunwood, the lessees, still continue to sink No. 2 in a tunnel running from Missoula gulch, crosscutting the ledge. The works of the Tracy tunnel in Park canyon, a distance of 400 feet from the Major Budd mine, are being run night and day. At present the tunnel is in a distance of 200 feet on a quartz seam running direct to the ledge. Assays made from the seam during the progress of the tunnel showed 110 ounces in silver and a high percentage of copper. The whim and old shaft-house of the Black Pine burned

down Saturday week. Mr. Harper said they intended to tear it away and put up steam hoists outside very shortly. Sinking is being actively carried on at Upton's Mountain Chief at Meaderville. The shaft is now down 430 feet, and it will go 20 feet further. This mine produces both silver and copper, and is chiefly valuable for the former. Lee Durney, John Menary, and Ed. Keith have taken a lease on the Smokehouse lode, and will commence sinking on Utah street to-morrow. This is the outcome of the decisions in the famous Smokehouse cases at Deer lodge, and is the first overt act under the title confirmed to its proprietors. The Minnie Irvine has again resumed sinking the main shaft from the 80-foot level and will continue till the 150-foot level is reached. On the 80-foot level of this mine from average samples the returns were 60 ounces per ton. The Ramsdell Parrot has encountered a large body of 60 per cent copper ore on the 200-foot level during the past week. This, with the recent find of a large quantity of free-milling silver, will entail putting on an additional force the coming week, and commencement of levels on the 400, as only the station is cut there at present. Pumping has been commenced at the Mountain Consolidated. The undertaking of removing the ore dump at the Anaconda, which has accumulated in the process of developing before erecting their present vast works, has begun. The Placer Lead's shaft is down a depth of 60 feet, and they are now busy drifting and opening up generally. Messrs. Bowden & Co., the lessees, are very quiet about their property, and, from indications, have something good. The Butte Reduction Works have large quantities of ore piles burning around their works, enough to keep them in active operation for a long time. They work almost exclusively on custom ore. Robert Robinson will superintend the Last Chance in Fourth of July district, and operations will be resumed immediately. All the necessary appliances have been purchased. A good deal of ore is being hoisted at the Original, which helps the Gagnon in its pumping operations. The latter's pumps hoist to the 300 level, from whence the Original takes it to the surface. Drifting commences on the 100-foot level of the Trifle to-day. Where the shaft struck the ledge, some very fine ore was encountered. Messrs. Young & Porter are the lessees. Much ore is being shipped from the Stephens, and hoisting is being done by three different shafts and as many different hoisting works. Stopping on the 300 is being pushed in Clark's Fraction, and five men are taking out some very fine ore. William Whitmore is the foreman. The Hope Co. will begin sinking an additional 200 feet to-day. The mine was never in better condition than it is to-day. The Bulm Co. has let the contract for sinking its shaft 100 feet at \$5 a foot. Farraday, of the Morning Star, remarks he will be ready to commence operations by to-morrow. Mining operations have been closed on the Volunteer South upon the Big Butte. There is a prospect of the early resumption of work on the Levina under lessee. Only drifting and general development is in progress at the Orphan Girl. From J. Drew, of the Taylor district, it is learned that the prospects recently struck there are looking very favorable, and he predicts a stampede to that locality in the near future. The converters at the Parrot smelter have been shut down, owing to a scarcity of matte. They will start up again in a day or so. The balance of the vast concern is in full operation.

THE GRANITE.—*Cor. Butte Inter-Mountain*, June 7: The total dividends, including the June dividend of \$200,000, aggregate the princely sum of two and a half million dollars, and since the new dividend order which went into effect in April, the rate has been \$2,400,000 per year. This amount, 50 cent, Plummer states, will probably be increased 50 per cent, and perhaps 100 per cent, inside the next year, by which time the milling capacity will be largely increased. The milling plant of this company is as perfect as can be found anywhere in the world. It consists of the original 20-stamp mill constructed in the fall of 1884, increased to 30 stamps the following year, and the recently constructed 40-stamp mill in which the acme of perfection has been reached. The company has now in contemplation the doubling of its present milling capacity—in fact, more than doubling it. The plan is to erect a new mill down near Philipsburg, to contain 20 five-stamp batteries. It is probable that only half of this number of stamps will be put in this year, however. Adits No. 1, No. 2, and No. 3 are driven in upon the vein several thousand feet each, and in all of them the immense chimney of ore known as the Bonanza Shoot is exposed. Nearly all of the stopping that has been done has been confined to the ground above adit No. 3. For over 2000 feet a vein of ore is uncovered, averaging from four to eight feet in width, and assaying from 200 ounces away up into the thousands in richness. On the No. 6 the same shoot of ore is uncovered for a distance of 2200 feet. The sunp is 100 feet below this line, and drifting will be commenced as soon as the station is cut out. The company has 335 men on its pay-roll. The Granite Co. employs 100 pack-mules to bring in wood from points in the mountains, where wagons would be likely to turn double somersaults.

ANACONDA IMPROVEMENTS.—*Anaconda Review*, June 9: The work of placing the machinery in position at the silver-mill is still being pushed ahead as fast as possible, and if the power was ready the silver-mill would be ready for business within ten days. Ground has been broken just east of the new concentrator for a new smelter building which will be 162x350 feet. The railway track has been laid into the new orehouse, and a number of the partitions in the third building are being taken out preparatory to putting in the steam stamps. The masons are busy bricking around the boilers in the power-house, and everything has assumed its customary business air at the lower works. The tunnel to drain water from the water-wheel pit is within ten feet of completion, and the ditch from the old concentrator to the new power building is being hurried forward. Everything tends to show that the works will be well under operation by October 1st.

PHILIPSBURG.—*Mail*, June 9: The Sulrana, lying east of the Sunnyside and south of the Peer, both of which are locations of the Granite Co., has been bonded by E. D. Holland, Kaiser Bros., and Toni Hynes, to George Babcock, who is representing Butte parties in the deal. The bond is for \$50,000 at nine months; work to commence in 45 days. The New Departure and Piano locations, owned by the same parties, are also included in the bond. We have it on good authority that Mr. Champion will

arrive from Salt Lake by the end of the week, having been successful in forming a syndicate to work the O'Donnell property, now held by M. J. Caplice, adjoining the San Francisco on the south and parallel to it, together with the Sanders, the Sheppard, the Severson, and the Bowie. A Salt Lake expert will accompany him for the purpose of examining and reporting on the properties.

BT-METALLIC.—The Elaine shaft is now down about 370 feet, and water easily handled. We have been informed, though not authoritatively, that the extraction and shipping of ore from this property was discontinued because the machinery is not heavy enough for more than the sinking of the shaft, and this is, of course, the most important present work.

WEST GRANITE.—On the Rattlesnake ground, the shaft has now attained a depth of 300 feet. The ground continues favorable for rapid sinking, though there is a large amount of water. The crosscut on the Butte is now in 60 feet, running through Granite, which in the tunnel face is growing soft as though approaching a lead. The tunnel on the Elizabeth is in 345 feet, following the hanging-wall in promising looking vein matter.

ALTOONA.—The crosscut tunnel got into softer granite yesterday morning, and is by this time fairly in the vein. The width of the vein at the point of tapping it is of course not known as yet. The tunnel reaches the vein some 300 feet west of the shaft.

NEW MEXICO.

THE NORTH HOMESTEAK MILL.—*White Oaks Enterprise*, June 2: This mill is situated about 1500 feet down the canyon from White Oaks. This mill was erected by the owners of the North Homestead mine, Jas. M. Sigafus and J. Everett Bird, of Tarrytown, N. Y. Mr. Bird is the superintendent. Mr. Delarge has charge of the mill. This is an E. A. Huntington centrifugal roller quartz-mill, manufactured at San Francisco, Cal. It is of a type well known upon the Pacific Coast. Although this is the first erected east of the Rio Grande in New Mexico, this is by far the best of the many mills which have used the centrifugal principle of ore grinding or pulverization. The mill is equipped with a Dodge crusher No. 2 Huntington automatic feed, and is otherwise as complete as possible. The owners have abundance of ore and we see no reason why they have not entered upon a long career of prosperity. The frame residence being erected east of the mill, 22x24 feet, will be occupied by Mr. R. Delarge and family. A large body of lead ore has been opened in the Miner's Dream, near Kingston. If further development realize present expectations, the Kingston smelter will start up by the middle of June.

PROSPECTORS.—*Black Range*, June 2: Considerable number of prospectors are looking over the country in this district. Prospectors will find no better showing in the Territory than northern Black range can give. A shipment of ore has recently been made from the Way Up and Little Minnie mines.

OREGON.

THE TABOR AND SWAN STRIKE.—*Cor. Bedrock Democrat*, June 8: Another monster ledge of gold quartz has been discovered in the Silver Creek mining district by Messrs. Clark, Tabor, Swan & Co., about four miles east of Mother Lode of Cable Cove and running parallel with and somewhat similar to the Mother Lode. The ledge was first discovered last November, in the channel of Cracker creek, where the action of the water had crosscut and exposed it to view for 50 feet in width, showing a mass of sulphureted quartz, with an occasional seam of high-grade gold ore from which a sample was taken for assay which yielded \$80.00 in gold per ton. Nothing more was done with the property until recently, owing to the deep fall of snow, which has rapidly disappeared on the hillside, into which a tunnel is being run along on the ledge, from which samples have been taken for assay which run from \$40.00 to \$185.00 per ton in gold. The hillside into which the tunnel is being run is very steep and facilitates developing to a great depth. On the opposite side of this hill, the ledge is crosscut by the action of the waters of Trout creek, where the same character of ore is exposed as that described above; also, on the top of the hill between these two streams, the ledge crops out boldly, forming large bluffs of decomposed, rusty quartz. In fact, this ledge can be seen for miles cropping out at intervals along its course. A few hundred feet from the above described ledge and running parallel with it is a much larger vein of quartz, which is probably 600 feet in width.

THE PARKER SMELTER.—*Oakland (Or.) Enterprise*, June 10: The new Parker quicksilver smelting furnace arrived on the freight train on Tuesday last, and was conveyed directly to the mine. The work of putting in proper position, ready to receive the ore for smelting, etc., was superintended by Mr. Parker, the inventor. This furnace, Mr. Parker informs us, will do just five times the amount of work of the old ones. Should this smelter do all that is claimed for it, orders for four more will be sent to the foundry. So it is only a question of a month or so when all these mines will be in full operation, and thus open up a new industry in Oakland.

UTAH.

GOOD ORE.—*Southern Utah Times*, June 9: Star mines, south and west camps, are nearly all yielding good ore and proving profitable property. Regular development work goes on at the Horn with mostly new hands underground. Regular shipments of ore are sent out and the big bonanza more than pays expenses. Kruse Bros., Poudler & Kaas are reasonably elated over a new strike of heavy galena ore in their Anchor mine in this district. All the way down, 150 feet, and in all their drifts they have followed encouraging stringers of ore; but not until Wednesday last did they encounter any considerable body. Now the face of the main drift and bottom of the shaft is a mass of beautiful cube galena ore the same as the best that the Carbonate or Rattler mines ever produced. The Anchor is on a line with the above-mentioned property, of the Frisco Mining & Smelting Co., and the opening of the Anchor ledge proves that that entire water belt at the base of the Quartzite mountain is heavy with silver and lead.

**IMPROVED
HYDRAULIC
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

HOSKIN & CO., Marysville, Cal.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearing, coars or pulleys.

Power applied direct. Works Ore at Low Cost More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

WM. GUTENBERGER.

Sacramento Foundry, Cor. N and Front Sts. SACRAMENTO, CAL.

**THE FRISBEE-LUCOP MILL,****A CENTRIFUGAL ROLLER MILL**

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE, Of Different Strengths as Required.

NOBEL'S EXPLOSIVE OELATINE, which contains 94 per cent of Nitro-Olycerine, and OELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

IMPORTERS AND DEALERS IN

**ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,**

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scoriafiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

NOTICE.—My Silver-Plated Plates are well known and used everywhere. They have proved superior to all others in durability and weight of Silver.

JAMES LEFFEL'S

Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONDITION POWDER.—James W. Griffes, Hanford, Tulare Co. No. 364,408. Dated June 7, 1887. This is a new and useful composition of matter to be used in veterinary practice as a condition powder. It is intended for the treatment of all blood diseases, and is given in doses of one tablespoonful twice a day, mixed with the feed. The compound is composed entirely of vegetable substances.

REVERSIBLE PLOW.—Neil McLean, Watsonville. No. 364,362. Dated June 7, 1887. This is an improvement on a patent which was granted to the same inventor last year. The present invention has for its object such a construction of the framework and the shares that either one may be removed when desired to use the plow as a single plow only, and a short supplemental landside may be put on in the place of the one removed. It also relates to certain improvements in the device for holding and locking the beam.

APPARATUS FOR SAVING FLOURED QUICKSILVER.—J. H. Rae, Dayton, Nev. No. 364,372. Dated June 7, 1887. This is an apparatus which is especially useful to assist in the amalgamation of precious metals and to save quicksilver which has been floured by grinding or other processes so that it is liable to be carried off in a state of minute division. It consists of a pan or tub within which the usual muller arms are operated, and in connection with this of a circular electrode having numerous points, and so suspended as to dip into the upper part of the material contained in the tub, while the negative electrode connects with the metallic lining or bottom of the tub. We gave a detailed description of this apparatus with engraving, a few weeks since in the PRESS.

PIANO ACTION.—Daniel E. Dopp, Santa Rosa. No. 364,399. Dated June 7, 1887. This relates to actions of upright pianos. It consists in the novel spring connections of the hammer-butt and the back-check by which the inventor avoids the employment of ordinary pivots packed or hushed with cloth, which become subject to dampness, and also by which a satisfactory delicacy and rapidity of action are effected; in the adjustability of these spring connections for the purpose of exactly adjusting the hammer and the back-check; in the peculiar arrangement and relation of the back-check to the hammer-butt and operating jack whereby said back-check is enabled to take the place of said jack after the latter has thrown off the jack, by which means a rapid retreat of the hammer is produced; in the damper, spring and connection by which said damper is operated, and in the screw-guides for adjusting the jack extension, and other details.

DEPRESSION PULLEY.—Warren Dunham, Igo, Shasta Co. No. 364,400. Dated June 7, 1887. This depression pulley for cable roads consists in the novel split or separable pulley, the means for opening it to release the rope,

the means for closing it and details of construction. Depression pulleys are used at changes of grade in the line of the road, the object being to hold the cable down to conform to the general line of its travel in the tubs or tunnel. Sometimes these pulleys are fixed or stationary, in which case they are peculiarly located, and the gripping device is also constructed in such a way that it removes the cable to one side as it passes the pulley, thereby avoiding interferences. Sometimes depression pulleys are mounted in pivoted frames, so that they may be knocked-out of the way by the passing grip, the pulley being returned to position by a weight. It is the object of this invention to provide a simple and effective pulley of this class, the construction and operation of which are essentially different from those now in use.

New York Metal Market.

Telegraphic advices dated June 16th give the following New York prices:

RAR SILVER—50c per oz.	
BORAX—54@54c	
COPPER-LAKE—\$9.26@9.50	
IRON—No. 1, \$22.00	
LEAD—\$4.30@4.35	
QUICKSILVER—52@54c	
The following is the latest by mail from the "New York Metal Exchange Market Report":	
COPPER—Firm, spot closing at \$9.90@10.00. Transferable Notices (Lake) issued at \$9.85@—, Transferable Notices (Chili Bars) issued at \$9.80@—.	
LEAD—Steady at \$4.67@4.76 spot. Transferable Notices issued at \$4.72 1/2.	
TIN—Quiet at \$22.75@23.10. Transferable notices issued at \$22.80.	
Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.	
Australian Tin, \$23.00@23.25; Billiton Tin, \$23.50@23.60; Banca Tin, \$23.00@24.00; Baltimore Copper, \$9.05@9.25; Orford Copper, \$9.00@9.25; P. S. C. Copper, \$10.00@10.25; Foreign Lead, \$4.67@4.76; Foreign Spelter, \$4.70@4.75; Antimony, \$7.65@7.70.	
MARKERS' PRICES—At tidewater. 100-ton lots of listed metals (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$20.50@21.00; No. 2, \$19.50@20.50; Grey Forge, \$17.50@18.00; Hudson River, Grade No. 1, \$20.50@21.00; No. 2, \$20.00@21.00; Grey Forge, \$17.50@18.00; Southern, Grade No. 1, \$21.50@22.00; No. 2, \$21.00@—; Grey Forge, —@—.	

Mining Share Market.

There is little new to report in the stock market regarding the situation in the Comstock mines; it also steadily growing better. Extensive explorations are in progress in nearly all the leading mines, and many new and valuable deposits of ore are being developed and opened up ready for extraction with no required. The lower levels of several leading mines are stacked full of ore.

It is now conceded by all mining men that the fire in the bulkhead portion of the Consolidated California and Virginia mine has been drowned out by the flood of carbonic acid gas poured into it, and that work may soon be commenced in the region so long occupied by the smoldering fire. They will soon have two big mills ready to work the ores of this region, and to work them at a good profit, as the mills will be run by water-power.

Work is progressing rapidly on the big new water-mill that is to be erected just below the Chollar old shaft. The stone foundations will soon be completed, and by that time the timber work will be ready to be placed in position upon them.

There is a fine stage of water in the Carson river, and it is likely to last all summer. The capacity of some of the river mills is being increased, and soon the amount of ore reduced down there will be greater than for many years past.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Drummond (for May) \$195,000; Alice, 8, \$19,600; Moulton, 9, \$21,840; Lexington, 10, \$19,362; Hanauer, 9, \$25,770; Germania, 12, \$60,290; Hanauer, 12, \$32,000. The shipments of the metals out from Salt Lake City for the week ending Saturday, June 11th, inclusive, were 22 cars of bullion, 533,293 lbs.; 55 cars silver and lead ores, 1,659,850 lbs.; 4 cars copper ore, 108,300 lbs.; total, 81 cars, 2,301,448 lbs.

THE Los Angeles Tribune says: Two mountain peaks, and two only, so far as is known, are candidates for the honor of holding up to the heavens Mr. Spence's observatory. These are Wilson's peak and Monrovia peak; this latter is 4000 feet high, and rises up sheer and isolated.

CALICO MINING DISTRICT shipped out \$65,283.59 in bullion during May.

PATENT
LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning
 and Salivation.

The most perfect appliance for people engaged in
 Smelting, Dry Crushing, Guano Works,
 Quicksilver Mines, Lead Corroding, Thresh-
 ing and Stock-driving, and all other occupations
 where there is dust, poisonous vapor, or bad odor.
 In Feeding Threshing Machines, and similar
 work, they are indispensable, as no foreign substances
 can be inhaled when they are worn.

The Respirators are sold subject to approval after trial,
 and if not satisfactory the price will be refunded. Price,
 \$3.00 each or \$30.00 per dozen. Sent post-paid to any
 address on receipt of price.

THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use.
 It has fewer parts, requires less power, is simpler in
 adjustment than any other. Feeds coarse ore or soft clay
 alike uniformly, under one or all the stamps in a battery
 as required.

In the Bunker Hill Mill it has run continuously for two
 years, never having been out of order or costing a dollar
 or repairs.

"CHALLENGE" IMPROVED ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far
 superior to any form of "Roller" Feeder manufactured. We refer to the follow-
 ing gentlemen who have furnished us with testimonial letters to the
 above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Min- D. O. WICKHAM, Taylor Mine, Greenwood, Cal
 ing Co., Amador City, Cal. J. R. TREGLOAN, Supt. South Spring Gold Min-
 W. G. ROBERTS, Greenwood, El Dorado Co., Cal. ing Co., Amador City, Cal.

And many others, and we are prepared to furnish either the

"CHALLENGE," "STANFORD," "TULLOCK," or "ROLLER" FEEDERS,
 And will furnish descriptive Catalogues and copies of Testimonial Letters, and will
 quote prices upon application.

 and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers
 cordially invite miners to critically
 examine and pass judgment upon
 this improved system of milling
 and amalgamating ores in the fol-
 lowing particulars:

1. The cost is less than one-half of
 stamps of same capacity
2. The freight to mine is less than
 one-half of stamps.
3. The cost of erecting is less than
 one-fourth of stamps.
4. The power to drive it is less than
 one-half of stamps.
5. The wear is less than one-quarter
 of stamps.
6. There is no wear except on
 shoes and dies.
7. In point of amalgamation it is
 superior to any other machine
 in use.
8. In its simplicity of construction.

We challenge competition with
 Stamps, Ball Pulverizers or any
 other ore crushing machines now
 before the public.

Send for Circulars and Price List.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), London, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

**ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7, No. 109 California Street, SAN FRANCISCO, CAL.**

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, hearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

Diamond Mines.

The engravings on this page represent sections of the famous Kimberley diamond mine, South Africa. The mine was discovered in 1871, and is by far the richest in South Africa. Gardner F. Williams of Oakland, Cal., recently read a paper describing these mines before the American Institute of Mining Engineers, and from this we take the descriptions of the mine.

Figs. 1 and 2 are sections. The drawings are taken from Government reports and represent the work done up to the end of 1883. The Kimberley has been worked as an open mine to a depth of nearly 500 feet and a prospecting shaft has been sunk in the bottom to a further depth of 100 feet. The outer line, Fig. 1, shows the opening at the surface. Below the red soil of the surface was found a decomposed or disintegrated diamond-bearing earth, which gradually changed into the "blue" or hard diamantiferous cement. This deposit was surrounded on the surface to the depth of 60 to 70 feet by a yellow shale. Underlying the yellow shale is a black shale about 200 feet thick. Below the black shale is a very hard, amygdaloidal, igneous rock. It will be seen by the engravings presented on this page that in depth the surrounding rocks are gradually encroaching on the diamond-bearing earth.

This is proved to be the case on the north, south and east sides of the mine, and until recently it was assumed that the hard rock would also be found to encroach on the west side. The "blue" ground in that part of the mine has been very poor, and the hard wall-rock has not been reached except by tunnels or drifts. This work shows the hard rock at two points, one 50 feet above the other, to have a decided dip to the northwest or outward dip. Further work will have to be done to prove beyond a doubt the position of the wall-rock on the west end of the claim.

The greatest drawback to the working of the mine has been the caving of the friable shales which surround it. As soon as the claims lying adjacent to the shale had been worked to any depth, the shale (or "reef" as it is usually called) commenced to subside and fall into the pit. The greater the depth attained, the more extensive have been the falls of the shale. During the past few years the work of hoisting "blue" ground has been almost entirely stopped for months at a time, owing to the great masses of fallen reef which have to be removed.

The Mining Board had moved, under their direction, from the commencement of work on its mine to May 1, 1883, 10,328,489 loads of 16 cubic feet. It is assumed that a load is equal to 10 cubic feet of rock in place, which would give 3,824,440 cubic yards of solid rock.

In September, 1884, there was an immense cave which completely buried a large portion of the mine and destroyed a large amount of machinery. In another number of the Press will be given the methods of working these mines.

The Crown Point Mine.

The Crown Point mine, in Nevada county, this State, is being negotiated on the London

Academy of Sciences.

At the regular meeting of the California Academy of Sciences on Monday evening, Dr. Gustav Eisen contributed an original monograph, "Anatomy of *Sutroa Rostrata*, Found only in Mountain Lake." Dr. Eisen said he first discovered this worm in 1877 while exploring a small spring on the north side of Mountain lake, near the Presidio Reservation. He had visited

Not a Gambling People.

The spirit of gambling has never been especially rife in California, the general impression to the contrary notwithstanding. During pioneer days, play for money was common in the mining camps and even in the larger towns, but the practice gradually died out as the flush times abated, and is not more prevalent now in this than in the older States of the Union.

We have been a bold, venturesome sort of a people, disposed to take desperate risks and engage in all manner of hazardous enterprises, pushing them sometimes in a reckless manner. We have had excitements in the mining share market, attended with heavy transactions in stocks, but these movements have almost always been based on actual or supposed ore developments.

Hardly ever have they resulted from pools gotten up or corners effected for such special purpose. Rings for speculating in wheat, coffee or other staple commodities of subsistence have been little known here. Efforts made to that end have been with us mere incidents, even our mining ex-

citements having been periodical and short-lived. We have not now, nor have we ever had, anything corresponding to the furor that in New York and other Eastern cities rages without intermission or abatement, affecting all classes of the inhabitants.

Outside the purlieus of the Stock Exchange one hears little of the vile jargon of the "Bourse." Even our business men are little versed in its outlandish nomenclature; not one Californian in a hundred knows anything about puts, calls, privileges, spreads, or straddles, slang with which the average New Yorker is so familiar. To talk to most of our people about these things would be to speak to them in an unknown tongue. To the Eastern operator, with his cute methods, California seems a hucolic country, her people provincial and rustic. If we ever were accounted smart at

illegitimate money-getting, we have been left far behind in this scramble after wealth, in which these Eastern populations are engaging with such indecent and fatal haste.

AN International Congress of Science and Industry is proposed for Brussels in 1888. Prizes to the value of \$100,000 will be awarded for the best papers on various stated subjects, and many important applications of science will be discussed. The commercial section will consider export and import duties. This is expected to prove a welcome change from the round of international exhibitions.

THE Nevada City Transcript says: There is great inquiry for mining property in this section. At least a dozen men from abroad have been here during the past two weeks, looking for investments.

Fig. 2.—EAST AND WEST SECTION OF KIMBERLEY DIAMOND MINE.

feature in these days. Without at all intending to discuss the merits of the mine, of which we know nothing except by hearsay, it is well to call attention to one fact. Some of the "experts" who have examined the Crown Point, from which mine rich specimens have been taken, and which is reported to be a good paying mine, state: "The smaller cost of milling the Crown Point quartz is caused by its being 'softer' than the usual run of milling ore of the district." The fact is that the gangue of the Crown Point mine, instead of being quartz, is a crystalline magnesian limestone or dolomite. We have a piece of this dolomite, and have the result of an analysis recently made by a competent person in this city. It is as follows:

	Per cent.
Carbonate of lime	55.5
Carbonate of magnesia	40.4
Iron and manganese	4.5
Traces of silica	0.5

Archostaphylos, or "Manzanita," a new species of which he had discovered and named Stanfordiana, in honor of Leland Stanford, Jr.

The president announced that Bulletin No. 7 was ready for distribution. It contains the following papers: "Ocean Currents Contiguous to the Coast of California," C. M. Richter; "Pacific Coast Alders," C. C. Parry; "West Coast Pulmonata, Fossil and Living," Dr. J. G. Cooper; "Studies in the Botany of California and Parts Adjacent, VI," Edward Lee Greene; "Ornithological Observations in San Diego County," W. O. Emerson; "Desmids of the Pacific Coast," Francis Wolfe; "Fungi of the Pacific Coast, V," H. W. Harkness; "Occultations of Stars by the Dark Limb of the Moon," George Davidson.

The next meeting of the Academy will be held July 18th.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Gridley and His Sack of Flour.

EDITORS PRESS:—In your issue of June 4th I note your article with above heading, etc., and thinking, after reading yours, that while you are recording history it should be correct and full, I write this.

As president of the Sanitary Commission of the State of Nevada, with headquarters at Virginia City, I necessarily was cognizant of the proceedings for the sale of the Gridley sack of flour, which realized a larger sum from Virginia, Gold Hill, Silver City and Dayton, per capita of population, than from any portion of the United States. The facts are these:

A large public meeting was held on a Sunday (I forget the date) in 1864, at Piper's Opera-house, Virginia City. At that meeting Mrs. Emma Hardinge-Brittan spoke for two hours, stirring the audience to the highest feeling of patriotism. At that meeting I presided. At the close of Mrs. Hardinge's address, a gentleman whispered to me that Mr. Gridley, with his sack of flour, was in the ante-room. (We had all heard of the Austin sales.) "March him in with the sack in hand—quick!" I said, for I took in the situation at a flash. At once I notified the audience that the famous sack of flour and Mr. Gridley were in the building and would soon appear. The word "appear" had only dropped from my lips when in came Mr. Gridley, carrying the sack, amid rounds of applause. Up went the sack for sale, and in a short time over \$1500 in gold coin was received for it. The bids are matter of record in the *Virginia Enterprise*. It was then that the idea of starting out on Monday morning, through Gold Hill, Silver City and Dayton, was conceived and due notice given. The executive officers of the Commission then convened and made up the program for Monday's call on the pockets of the multitude for the Gridley sack of flour. Three open carriages were secured; flags for each of the carriages; a band of music and a large American flag. In due time (about 11 A.M.) all was ready. First came the band with banners flying. In the second carriage was Mr. Gridley, his sack of flour, Samuel Clemens (Mark Twain)—Mark represented the *Virginia Enterprise*, and your humble servant. In a third carriage were other members of the press. Nearing Gold Hill the band struck up the "Star-Spangled Banner," and the street became crowded. Soon a halt was made in front of Maynard's block, and the sale began. About this time the 12 o'clock whistle blew, which brought hundreds of miners to the surface. The sack was sold over and over again. Everybody bought it. Miners launched out their \$20-pieces freely, and in less than one hour over \$5000 was to the credit of Gold Hill section of the Sanitary fund. Your article says the procession was called "The Army of the Lord." There was no procession, but a grand gathering round the sack and carriage. I never heard of the title before reading it in your paper. The same scenes were enacted at Silver City and Dayton. Your article says at Silver City \$1375 was raised. Over \$3000, let it be said for the credit of Silver City (if my memory serves me right), was paid in. Dayton was as patriotic as any. Some gave their last dollar. It was now getting late in the evening. The sack had been sold hundreds of times and still Gridley held the sack, for the grand gathering of \$20-pieces was yet to come off. On reaching Gold Hill, the party took supper. The amounts realized, with other details, were all the time being telegraphed to headquarters at Virginia City, and so excited and patriotic did the people become that the military company was called out, and marched to Gold Hill to return with the carriage as an escort. About 8 P. M. the ball was opened in Virginia City. Miners left their work, and everybody seemed to be on hand. Speeches were made by Charley De Long, William M. Stewart, Thomas Fitch, Sandy Baldwin, and others, and between each the sack was sold and sold again. "Silver and gold seemed as stones in Jerusalem." Virginia City paid in, within about four hours, over \$12,000. The 12 hours' labor footed up (if my memory serves me right) \$20 short of \$24,000. All the money received was put into 14 silver bricks. Each brick had its value in gold and silver stamped thereon and the name of the prominent battle of the time. These bricks were forwarded by express to New York to Rev. Dr. Bellows, president of the National Sanitary Commission. In New York Dr. Bellows called a large sanitary meeting. These silver bricks were hung upon the branches of a tree erected on the stage behind a curtain, and with them, I think, the celebrated sack of flour. Dr. Bellows made the opening speech, and amid applause the curtain was raised, displaying the silver bricks among the evergreen boughs to the glory of Nevada's patriotism—the sack of flour—and memory of R. C. Gridley. Yours truly,

ALMARIN B. PAUL.

San Francisco, Cal., 1887.

The Miners' Union at Batte, M. T., now has 1700 members, and expects shortly to have 2000.

The Bullion Product.

EDITORS PRESS:—Referring to your editorial "Figuring on the Bullion Product," on page 364 in your paper of the 4th inst., I beg to state that the estimates of the honorable Director of the Mint are made up, for the most part, from the data furnished by the officials subordinate to his bureau. As you are aware, Judge Lawton furnishes the figures not only for California, but the whole of the Pacific Coast. Upon the data furnished by myself, the Director bases his estimate for Montana, and I am compelled to say that it is too low, much metal going out in the form of ore and matte which is not credited to this Territory at the port of export.

In regard to the source of deposits of bullion at this office, I would state that the most searching inquiry is made in each case, and any bullion from other districts is so shown in our records.

I inclose herewith one of our blank "deposit slips" which will serve to show the information given regarding each deposit of bullion made here. The deposit slip gives the name of mine, county, mining district, gulch, and number of ounces.

The output of Montana during the year 1886 amounted to no less than \$18,300,000 in gold and silver. Very respectfully,

SPOVILLE BRADEN,
Assayer in Charge.

U. S. Assay Office, Helena, M. T.

Pass Them Round.

EDITORS PRESS:—Your articles in issues of April 23d and June 4th on mining parlance have been read by me, and for fear such brilliant specimens of mine managers (?) might be lost to posterity, I have concluded to contribute my mite on the subject, which has come under my personal experience. One was a manager sent out to Old Mexico, whose ores were high grade in lead but poor in galena. Another was sent to Colorado and had a shaft 225 feet deep, 87 feet from his end line, where he suspected there was a body of ore; so he goes to end line and begins to sink another shaft 225 feet deep to get to it. But, fortunately, before he got it done, the money gave out, as it sometimes does in such Eastern companies. RUSTICUS.

THE CALIFORNIA STAMP AND PANMILLS.—Workmen are engaged in overhauling and putting in thorough repair the machinery of the California stampmill. The framework about the building is being put in order, new floors are being put down in places, tanks are being overhauled and all else is made as good as new. All repairs will be completed in about three weeks. At first the mill will be run by steam till a test has been made of the "Boss" continuous plan of amalgamation. Afterward all the machinery will be run by water-power derived from the Pelton wheels that are to be put into the C. and C. shaft. They are now engaged in work preparatory to the transmission of power from the C. and C. shaft to the big panmill, about 1500 feet to the eastward. They were yesterday laying out the foundations of the towers over which the cables will pass (on proper supporting friction wheels) in running from the C. and C. shaft to the mill. The two principal towers will be 30 and 33 feet in height. As the steel wire belt or cable will not be run in a straight line, there will be proper gearing on one of the towers (that which will be 33 feet in height) to run the cable to the panmill at the proper angle. A trestlework over 1000 feet in length has been constructed from the stampmill down to the ridge above the panmill, on which will be laid the iron pipe which will carry the pulp from the batteries to the pans. This pipe will be four inches in diameter. The trestlework on which it will rest is about 20 feet in height where it leaves the stampmill. This transmission of power to such a distance will be something new on the Comstock, and when the towers are completed, the wire cables put on, and all the apparatus in motion, will be en route to attract throngs of visitors.—*Virginia Enterprise*.

PURE TALC.—A test was lately made by Mr. Louis Blanding at the foundry, in Sonora, of the ability of a sample of pure talc, coming from a vein 20 feet wide and situated in this county, to stand a prolonged trial at white heat. The talc was mixed with $\frac{1}{2}$ its weight each of asbestos and fine clay—thoroughly ground together, made into a paste of thick consistency with water, molded into brick form and then sun-dried. When dry it was subjected to a white heat for five hours in a coke fire, sustained by a strong, steady, artificial draft. After cooling and examination the brick was found to show neither crack nor fusion, even on its sharp edges or corners. This result shows the discovery of this talc vein to be of great commercial value, being applicable to the lining of all forms of smelting furnaces, stoves and boilers. It is superior to fire-brick for this purpose; it can be more conveniently handled, and when the interior of a smelting furnace is to be repaired, as often happens, the material in a plastic state can be rapidly laid on with a trowel, making a smooth surface lining, and little or no chipping of the interior of the furnace is required. All foundrymen will appreciate this advantage and others equally obvious.—*Tuolumne Democrat*.

The Star Sirius.

[Translated for the Press from *El Globo de Madrid* by M. N. M.]

Every night at this time, between 12 and 1 o'clock, Sirius, the most beautiful star of the sky, is seen in the West. During winter it appears in all its splendor; in summer it is likewise visible above our horizon by day, and the astronomers, by the aid of their good telescopes, can distinguish and observe it. The difference which exists between the brightness of this star and all others which adorn space, is remarked by the unaided sight. Those who have doubts can easily fix its position; they have only to ascertain the point at which appear the Pleiades; some two hours afterward the magnificent constellation Orion is visible, and forming a right line with both constellations, and at a distance precisely equal, is present, splendid and sparkling, the most beautiful of stars, of which we now wish to give a faint idea. The wonderful brilliancy of Sirius reveals its extraordinary importance. In the ancient and middle ages it was believed that Sirius exercised a great influence over the earth. The celebrated philosopher, Kant, regarded Sirius as the central axis, the powerful focus of attraction, around which were circulating the sun and all the stars visible from the earth. Modern astronomers wishing to test the importance of this star have analyzed its light, calculated its mass, and measured its distance. Sirius sheds light and heat in torrents. Its sparkles pass over a trajectory of millions of kilometers before reaching the earth, and still preserve energy sufficient to impress the photographic plate and the thermometer. Before Sirius penetrates into the field of a telescope, a splendor of increasing intensity, resembling that of the Aurora, announces its arrival, and, when the dazzling star appears, surrounded by a luminous aureole, the impression that the eyes receive is so lively that they cannot endure it long without fatigue; and yet Sirius, observed with a telescope, is reduced to a smaller point than one can trace with a pen or a needle, however fine it may be. Indeed, stars, although they may be a thousand times greater than the sun, do not present appreciable dimensions to our sight because of the enormous distances they are from us. It is not the size of the stars, but their light, which impresses us. The greater the sight of the observer, the smaller appear the stars. With an excellent telescope, they are reduced to luminous mathematical points, but without extension. The

Astronomical Instruments

Do not augment the size of the stars; they serve to fix with precision the positions of the stars in the celestial sphere, to discover the secondary stars of the double or multiple systems, and to make visible the celestial bodies which are not so to the simple eye. It would be different, however, if we were treating of stars but little distant from the earth. The planets, for example, present in the telescope an appreciable disk in proportion to the optical potency of the instrument. The same takes place with the comets that penetrate into our system, with the sun and its spots, and with the moon, whose topography has been studied minutely and detailedly.

The Disk of Sirius

Measure according to calculations made by Wollaston, the founder of spectral analysis, 29,000,000 of kilometers in diameter, and its volume 7000 times greater than the sun. The parallax of Sirius is .193 of a second, and corresponds to a distance of 1716 billions of kilometers—1,000,000 times greater than the radius of the earth's orbit. It requires 16 years for the light of Sirius to reach the earth. We know ten stars that are nearer to us than Sirius, of which four are perceptible to the simple sight. This is a proof that the apparent splendor of the stars depends not alone on their remoteness, but also on their intrinsic brilliancy. The intrinsic brilliancy of Sirius is very superior to that of the sun. At the distance at which Sirius is found, the sun would appear a little star of the sixth magnitude. If Sirius and the sun should emit the same quantity of light per hectare of surface, the surface of Sirius would be approximately 288 times greater than the sun and 4860 times more voluminous. The diameters of both stars would be in the same relation as the numbers 1 and 17. It is probable that to equality of surface, Sirius may be more luminous than the sun, because the latter, by the yellowish tint, must be classified among the stars of the second, and Sirius figures among those of the first type, by the perfect whiteness of its sparkles. The spectrum of Sirius, rays characteristic of a hydrogenated and brilliant photosphere, is composed of various metals. Sirius, like Vega, Rigel, Regulus and other stars, is a sun, but without spots. Its light dazzles by its intensity, its radiation and activity are prodigious, and its volume is enormous. Considering the intrinsic brilliancy of Sirius, the diameter is not so great as it appears, yet from calculations which deserve entire credit, it is deduced that the surface of this star is 144 times greater than that of the sun, and its volume 1728 times greater. The diameters of both stars are in the relation of the numbers 1 and 12. In order to appreciate fully

these dimensions, it should be remembered that the diameter of the sun is 108 times greater than that of the earth, and that its volume is 2,280,000 times greater. The light of Sirius is four times more intense than that of the star Centaur, now considered as a type of stars of the first magnitude.

The Magnificent Star

Presents in its movement some irregularities whose causes are in part unknown. In order to explain them, the celebrated astronomer, Bessel, supposed in 1844 that a disturbing star allied to Sirius by the universal law of gravitation existed; and in 1857, Peters, taking as a basis the observed irregularities, calculated the probable orbit of the unknown star. Eleven years afterward the American optician, Alvan Clark, constructed a lens superior by its size to any then in use (47 meters in diameter), and to prove the power of this lens the son of Clark directed it to the star Sirius. The enterprise that he experienced was inexpressible. "Father," he screamed, "Sirius has a companion!" In fact, the theoretical star conjectured by Bessel existed, and was shining in the place which the calculation of Peters had assigned to it. Bessel discovered the companion of Sirius in the same manner that Leverrier discovered the planet Neptune—from his cabinet of study, without other aid than numbers and mathematical analysis, and long before the eyes of men were able to perceive it. Marvelous discovery, which, of itself, would suffice to glorify human reason! Bessel died in 1846, without being able to enjoy the immense satisfaction of seeing his prediction realized.

The Small Companion

Of Sirius has been observed with particular attention from the instant in which it was discovered. It is of a magnitude hardly perceptible between the rays of Sirius, and moves around it with great rapidity. Between Sirius and its satellite there is, according to the calculations of Amoers, the distance of 6000 millions of kilometers; seven times greater than the diameter of the earth's orbit. Given this distance, and on the supposition that the revolution of this satellite star is verified in 49 years, according to the calculations made, it results that Sirius weighs 14 times more than our sun, and its companion seven times more. It is not definitely known whether this satellite shines by its own light or if its sparkles are those of the enormous quantity of light which it receives from Sirius. This is a problem which will be solved in time.

The Planets of the System

Of Sirius, if there are such, must revolve at a considerable distance from this splendid star, describing orbits much greater than those of Jupiter, Saturn and Neptune; because if such planets move around Sirius at the same distance as Mercury, Venus, the Earth and Mars revolve around the sun, they would receive a quantity of light and heat so great that life would be impossible on their surface. Sirius exercises an attractive influence upon the nearest stars and upon the solar system. Indeed all the constitutive atoms of the universe operate upon each other at whatever distance they may be.

The Waters of the Ocean

Would be precipitated upon the moon if the force of terrestrial gravity should not impede. The earth with the bodies situated on its surface, attracts in turn the moon, and without going beyond the limits of pure science, we may affirm that each step which we take produces some infinitesimal alteration in our system. The terraqueous globe is subject not only to the preponderant action of the sun, but likewise to that of the other stars. The sun draws the earth with its planets and hears them toward the constellation of Hercules, but the movement of the sun is subject to the modifications with which other bodies incessantly impinge it, and Sirius among them. The part which Sirius performs in the universe is most important. It is impossible to contemplate this dazzling star without feeling surprised at the myriads of and prepotent forces of Nature.

FINE GOLD.—The unusually high fineness of the gold from the San Giuseppe mine, situated half a mile from the town of Sonora, Tuolumne Co., has often attracted the notice and excited the remarks of mining experts. While most gold quartz ores yield halflion that varies from \$16.50 to \$18 per ounce, the gold of this mine has uniformly gone as high as \$20.30 to \$20.40 per ounce. Recently an average sample of the ore for assay was taken from the tailing pile at the mine—some 90 tons in quantity—and the assay gave a result per ton of ore of \$19.64 in gold and one-quarter of a cent in silver. This shows a fineness equal to \$20.63 per ounce, chemically pure gold being worth \$20.67 per ounce. It is stated by men of great experience and extensive acquaintance with the gold mines of California and other countries that no other quartz mine in any country can show such fineness of gold. The only mine approaching it in this respect is the Mt. Morgan in Queensland.—*Union Democrat*.

THE SUPREME COURT has decided that the contractors who built the debris dam must be paid by the State. The money involved is some \$254,000. It will be remembered that before the work was all done the Drainage Act was declared unconstitutional, and the money was not paid to the contractors. It is now ordered paid.

A Great Windmill.

Windmills are so common and so useful in this State that we have thought a picture of one of the largest windmills in the world would interest our readers. It is in fact a good-sized flouring-mill run by wind-power. It is situated in the town of Great Yarmouth, England, and is pronounced a perfect success. The plan of arrangement of milling machinery is different from that of the present day. The mill is working on the old principle of a full reduction at the first grind. J. H. Campbell, M. E., of Yankton, Dakota, who has just published a pamphlet on the windmill and its uses for flouring-mills, sawmills, irrigation, etc., has arranged a mill with machinery so as to use part gradual reduction with burrs and part with rolls.

Of course, it is not necessary to build so large a mill as shown in the engraving, but it is desirable to build as high as possible for two reasons: First, to receive much more benefit by building a mill up to where the wind is fresh and strong; and, second, to get additional storage capacity, and it is much better to have that right in the tower of the mill than put up a building alongside; milling machinery can also be placed to much better advantage. A windmill built after the plan shown in the engraving will be 55-horse power, with the wind blowing at the rate of 25 miles an hour, and will make 120 barrels of flour easily in 24 hours. It is 11 stories high, with basement, and stands 99 feet above the foundation. At the base it is 35 feet in diameter, and 16 feet diameter at the top wall-plate. There are five run of burrs in it. It has four sails on the patent principle, which are 40 feet and 9 inches long by 12 feet 6 inches wide. The sails are 100 feet in the clear, from point to point. They are provided with striking and regulating gear to keep the motion regular and to counterbalance any unevenness in the pressure of the wind. It is provided with winding gear, so as to keep the sails always square to the wind, and it is so adapted that it can be turned out of wind, if necessary, for repairs, etc. The speed of the sails is set to nine revolutions per minute, and the first motion from head wheel to wallower is two to one. The head wheel is iron, with heavy wood segments bolted around the rim of the wheel, so as to form the inner section of the grips which is over and around it, and is used, when necessary, to stop the mill.

The milling machinery consists of one smut, one wheat-brush, two holting chests, three reels in each; one cornmeal bolt, one break run of burrs, one chop run, two run middlings and one run for either middlings or corn, as desired; one set of bran rolls, two set of smooth rolls, three purifiers, one brush-scalper for cracked wheat, and a rolling screen in the basement. It is provided with ample bin storage, so that any part of this machinery may be run and the product dropped without further handling, so as to make use of any and all winds which will turn the sails.

In his pamphlet to which we have alluded above, Mr. Campbell proposes to issue a more complete work, entitled "The Practical Windmill Builder and Millwright," which will give working drawings for making windmills either for flouring, sawing, irrigating, etc. We should imagine from the description that this book will serve an excellent purpose. Mr. Campbell's main design seems to be to induce a large increase in the use of Dakota winds for industrial purposes. We do not suppose that California can compete with Dakota in wind-power, and yet the great use made of wind here for comparatively small purposes would indicate that in some cases extension could be profitably undertaken.

It seems that in the east of England, where there is no coal and water-power is scarce, the windmill still holds its own, and improvements have been many. Mr. Campbell says that the first set of patent sails ever used were made in this town of Great Yarmouth, England, which, by the way, his father constructed and put in operation. Thus the writer has an inherited right to talk about the windmill, and we are glad of an opportunity to introduce him to California readers as a devotee to still further progress in the use of wind-power.

Iron in Del Norte.

It is a fact not generally known to the State at large that immense deposits of iron ore of various grades and classes are found in Del Norte county. Scientific men have at various times, while visiting the hills and mountains near Crescent City since its settlement by the whites, pronounced these ores of a high grade. These ores can be found in immense deposits in various parts of the county, but the bulk of it is in the Low Divids district, where copper mining was carried on quite extensively a number of years ago, and also a Baltimore company extracted large quantities of chromite-iron ore.

In the spring of 1874, William Sublette visited this place and spent some time in prospecting in the mountains in the localities named, with a view to ascertain the real extent of these iron deposits and the facilities which existed for their profitable working. This gentleman went away thoroughly satisfied that these deposits were inexhaustible, and that they

could be worked cheaper, and consequently with more profit, than in any other locality on the Pacific Slope. As a result of his investigations he found iron of all the various grades in abundance, with plenty of limestone necessary for fluxing purposes. Ample water-power is obtainable, and timber for charcoal is limitless. These mines are situated within 10 or 15 miles of Crescent City, which would be the shipping point, and it has been estimated that a tram-

Nevada Mines and Reduction Works.

The Reno Reduction Works have been and will continue to be of great advantage to the river-side town. Presumably the reason Reno was chosen as the situs for these works was owing to its being centrally located, and also because furnishing water-power to operate the

the finest of nut pins and mahogany timber from which charcoal can be made in large quantities at a small expense, and more especially is this true of the range of mountains on the west side of the lake. There is, in addition to the immense body of water in the lake, several large streams flowing into it from the west side, from which abundance of water can be obtained, and with such facility as to obtain any amount of pressure. If such works were erected, the ore which is now being shipped to Reno would be worked here, and would, therefore, not have to be freighted more than one-fourth the distance, and would not have to be transferred from one railroad to another, which means expense; all this would be saved, and it would create greater activity in mining in this county and in the country in proximity to the railroad. This mines at Downeyville and Lodi, in Nye county, which are noted for their immense proportions, could be worked profitably. Many mines in this section would also be worked, which are now unheard of, if such works were erected at the lake. There would we have a mining country, with hundreds of people, and then would the talk of dull times be stopped. When will this ever be done? Will those who are in position to effect this result exert themselves in this direction? Should a few men in this section, who claim to be identified with and who are anxious for the welfare of this county, take hold and try to accomplish these results, they would surely be obtained.—*Emerald News*.

Contributions to the State Mining Bureau.

The following are among the recent donations to the Bureau:

Four sections of mine timbers from the 1550-foot level of the Con. Virginia mine, compressed to about one-third their original bulk—W. H. Patton.

Gold quartz, Sinaloa, Mexico—Geo. Davis.
Silver ore, Queensland—R. H. King.
Calcite, Ruby Hill, Eureka, Nev.—Hank Mitchell.

Vanadinite, Arizona—J. Z. Davis.
Marble, several varieties, from Victor Marble Co., San Bernardino Co., Cal.

Building stones from near Cliff House—A. Sutro; do. from San Miguel, San Mateo Co.—O. E. Brady; do. from Blacklock, Oregon—from the company.

Sandstone and limestones from near Yreka, Siskiyou Co., Cal.—*Yreka Journal*.

Sandstone from Hanley, Siskiyou Co., Cal.—Robert Rangeley.

Sandstone (dressed), from the Southern Ledge Stone Co., Los Angeles, Cal.

Sandstone from Sao Rafael, Marin Co.—Jno. W. C. Maxwell.

Sandstone from Suisun, Solano Co., Cal.—C. P. Reeves.

Sandstone and marble, six varieties, from the Tehachipa Building Stone Co., Kern Co., Cal.

Rich gold quartz from the Providence mine, Nevada City, Nevada Co., Cal.—Melville Attwood.

Gold in calcite from Shingle Springs, El Dorado Co., Cal.—Henry Barnes.

Wulfenite, very fine, from Eureka, Nev.—W. A. Woodward.

One hundred spurs Italian rocks and minerals, cements, limes, plasters, etc.

Nova Scotia Mines.

The following is from the "Report of the Department of Mines, Nova Scotia," for the year 1886:

The returns show that 128,880 days' labor were performed, and 29,010 tons of quartz were crushed, yielding 23,362 ozs. 5 dwts., an average of 16 dwts. per ton, the maximum yield being 17 ozs. 10 dwts. per ton, and minimum 5 dwts.

The following summary shows the mineral production of Nova Scotia during the year 1886, compared with that of the previous year:

	1885.	1886.
Gold.....Ounces.	22,203	23,362
Iron ore.....Tons.	48,129	44,885
Barytes....."	353	427

Grindstones, etc....."	2,208	1,600
*Molding sand....."	200
*Amount Exported.		

CABLE CARS IN A MINE.—The *Anburn Republican* says of a contemplated improvement over in Placer county: A cable for hauling cars into the Hidden Treasures tunnel at Sunny South will soon be put in if found practicable. The expense will be nearly \$10,000, but the cars are now hauled in by horses and the cables will make quicker time. There will also be a saving of the air now consumed by the horses, which is deemed an important consideration.

THE FIVE GREAT INDUSTRIES.—Five great branches of manufacturing employ together 85 per cent of all the water-power that is used. Flouring and grist-mills use 33.4 per cent; sawmills, 22.7 per cent; cotton-mills, 12.1 per cent; paper-mills, 7.2 per cent; and woolen-mills, 4.4 per cent. The iron industry now uses scarcely any water-power.

Scale: 1-16 of an inch=one foot.

LARGE WIND FLOURING MILL AT GREAT YARMOUTH, ENGLAND.

way could be built from furnaces at the mines and the pig iron laid down at Crescent City at a cost of \$1 per ton. Transportation from Crescent City to San Francisco would cost about \$2 per ton, making say \$3.50 per ton from the mines to San Francisco. Sydney coal could be laid down here at a low rate, if this sort of fuel was thought advisable. Could the extent of these mines be thoroughly understood by capitalists, we have no doubt that steps would be taken to bring the iron product of Del Norte county to the front, which will certainly be done before many years.—*Del Norte Record*.

works. We are credibly informed that nearly 60 per cent of the ore received at these works is shipped over the C. & C. R. R.

On either side of Walker lake, but more particularly on the southwestern shore, is a splendid opportunity for capitalists to erect immense smelters and reduction works; and when erected and ready for business, they will have as large, if not a larger, field from which to obtain ore to keep the works in constant operation as there is anywhere.

Esmeralda county abounds in mineral of all kinds; the mountain-sides are supplied with

Passing Events.

Volume LIV of the PRESS closes with this number. We trust that all of our old subscribers and patrons are satisfied with our efforts to keep the paper up to a proper standard, and will remain with us for some time to come.

The only mining for copper carried on for some years in California has been at Spenceville, Nevada county. But now the old Copperopolis mines, about which there was such an excitement years ago, are to be reopened and worked again.

Our English cousins have this week been celebrating the 50th anniversary of the coronation of Queen Victoria. In this city the event was celebrated with appropriate ceremonies, in which all the natives of England took part.

The Pacific Rolling Mills of this city this week made the largest steel casting ever turned out on the continent. It proves that the Pacific Coast is making unmistakable advances in the mechanic arts, and that in the future there will be no doubts about our being able to build Government ships or other heavy work.

THE town of Copperopolis is about to undergo a mining revival. This Union copper mine is to be pumped out, with the object of working the mine. The copper interests in that section are valuable.

End of Volume LIV.

The MINING AND SCIENTIFIC PRESS is not only the oldest journal devoted to mining on the Pacific Coast, but in the whole United States. It has lived through all the ups and downs of mining history on the slope, and is still at its post as the representative of the industry. When its pages were first printed the mining area was small indeed as compared with this extent now being worked. During all these years it has recorded mining and metallurgical progress, as well as the industrial advancement, and bids fair to continue its labors for a long time to come.

The full and complete index on the last page of this number shows the variety and scope of the contents of the volume just completed. All interested in popular science, mining and mechanics will find that most subjects of general or special interest have been touched upon. We specially desire to call attention to the fact that all recent improvements in mining and metallurgical appliances, processes and systems have been described in our columns. Those who follow mining as a business can ill afford to be without a journal of this character, which brings before them the experience and ideas of others.

It is pleasant to note that our old subscribers remain with us, thus showing, in a material way, their appreciation of our efforts, and that new names are being constantly added. The publishers and editors endeavor in every way to carry on the PRESS in a practical manner so as to benefit its patrons to the utmost. Of late we have given more illustrations than formerly, and this feature it is the intention to still further enlarge. We shall be pleased to have the friends of the PRESS call the attention of others to its merits in order that its circulation may be still further increased and its influence correspondingly enhanced. This we can ask with confidence, feeling that all engaged in mining and industrial pursuits on this coast will be benefited by becoming readers of the journal which has so long represented their interests.

The One Thing Sure and Steadfast.

We asked our California land tillers, some six or eight weeks since, about how large a crop of our leading agricultural staples might be counted upon for the current year. We did not, of course, expect that anything more than approximate figures could be arrived at. An intelligent guess was the most that was looked for. Had such guess been attempted, the then anticipated yield of wheat would have exceeded by 25 or 30 per cent that which will be actually realized for the year. The falling off in the expected grape crop and, perhaps other of our land products will probably be about as large.

We allude to this condition of things as illustrating the uncertainties that, even in a fairly good year, attend farming pursuits in this State, these uncertainties being not much less in most other countries. And yet farming is everywhere regarded as being a proverbially sure business. While it must be conceded that money invested in land is apt to be safe, the proceeds of such investment are at the same time subject to great fluctuations, far greater in this country than is the output of our gold mines. If this has not always been the case, it has been because gold mining had in former days to be carried on under conditions far less favorable than those that at present prevail. We had to learn the business, a thing that required time and much costly experimenting. But, having learned the business, and learned it well, we are able to prosecute it with a steadiness of results such as attends hardly any other. The expert gold miner can make his calculations with more certainty than the merchant, the manufacturer, the fruit or the grain-grower. Less of the element of hazard enters into this branch of mining than into any of our other leading industries. The factors of success are here notably stable. The prospective stock of ore can within reasonable limits be arrived at. About what the mass of this ore will pay, and what it will cost to mine and mill it, can also be determined in advance. On the cost of plant, labor, transportation, etc., the miner can now figure very closely.

It was on data so fixed and easily ascertained that on the occasion referred to we based our estimate of the California bullion product for

the present year. We said then it would amount to very nearly \$19,000,000. That is what it will be. Nothing can happen to make it less. There may occur drought or floods, war, famine or pestilence, yet none, nor all of these, could much reduce the California bullion product for the current year, nor yet for any year in the near future. What is true of the conditions that now obtain will be true of them for many years to come. Not during this nor the next generation will gold mining in this State be more hazardous or less productive than it is at present. Further improvements in these respects may be rather looked for. It is destined to be, if not the longest lived, at least the most profitable and reliable of all our industries. Trade may be dull, factories closed and money tight; real estate may tumble, and bankrupts multiply, but this pursuit, sure and steadfast, will hold the even tenor of its way, little affected by the financial cyclones that carry disaster to so many other interests and industries.

California Powder.

Among the prosperous home industries of California are the powder manufactories, more especially those of high explosives. Most of the companies have very extensive plants, the main ones being on the bay shore of Contra Costa county. The largest black-powder works are at Santa Cruz. Immense quantities of the high explosives, in the composition of which nitro-glycerine enters, are made here and consumed on this coast in the mines and railroad works. Of late, however, the market for this powder has been extended, and large and regular shipments are being made to the Lake Superior copper mines, the Birmingham, Ala., iron mines, and other points where powder is used. The powder is shipped East in boxes as first-class freight. We get niter from Peru and sulphur from Japan at this port cheaper than they get those materials East. It is stated that about 4,000,000 pounds of powder are used every year at the Lake Superior mines alone.

Some powder has been shipped East from here before this, but of late much larger quantities are going forward. This is said to be owing to the breakage of the "powder pool" here. Powder can now be purchased much cheaper than was the case a few months since. The Eastern powder companies have a pool to keep prices up, and there being none here now, the product made here can be sold there. But this condition of things is not likely to last long.

The manufacturers of high explosives here have long had a good field. Their experience has enabled them to manufacture special grades for special service, and they have adapted their product to various kinds of work. The powder made is always fresh and good and up to the standard.

Foundry Notes.

The Pacific Rolling Mills made this week the heaviest steel casting ever attempted in this country. It was the stern post for the new Government cruiser Charleston. Preparations for the casting have been going on for several weeks. To make the casting, 30,000 pounds of steel had to be melted, two furnaces being used. The stern post, when completed, will weigh 15,000 pounds. It is L-shaped, 22 feet long on the keel and 20 feet high. The greatest width is five feet. The steel used was of course up to Government requirements and was carefully tested. It will be several days before the casting will be examined, but, so far as known, the process was successful. This event marks an era in our mechanical progress on this coast. The Government inspectors pronounce the steel made at the Pacific Rolling Mills as good as any they ever saw. Steel from all the heats is carefully tested by the appliances at the Union Iron Works, where the cruiser is being built.

The Union Iron Works are preparing to exhibit at the Mechanics' Institute Fair various pieces of the new U. S. cruiser Charleston, now being constructed at the works. The exhibit will include the largest driving shaft ever shown on this coast. There are now 400 men at work in the Union shipyard and 1100 men in the shops.

The Pacific Iron Works are now manufacturing the appliances used in the Rae electric system of working ores, such as are in use at the Douglass mill, Dayton, Nev. This system is to be introduced at other mills in Nevada.

Advancement of Science.

The thirty-sixth meeting of the American Association for the Advancement of Science will be held at New York from Wednesday morning, August 10th, until Tuesday evening, August 16th.

The trustees of Columbia college, at the request of President Barnard, have tendered the use of the several halls and offices of the college for the purposes of the association. As soon as the decision of the standing committee was known, the New York Academy of Science formed a special committee to forward the arrangements for this meeting and requested the co-operation of the various colleges, societies and public institutions in the city and vicinity. This co-operation has been given most heartily and several meetings have been held, resulting in the formation of a strong and representative local committee which has organized for the work to be done with a resolve that the first, but long-considered, meeting in New York shall be made a local success; and the standing committee believes that, with this cordial co-operation of so many representative citizens of the great metropolis of the country, the meeting will not only be an assured success, but that the facilities for reaching New York from all parts of the country, and the ample accommodations at hotels and boarding-houses, with the comfortable quarters at the college, will result in a larger gathering of members than at any previous meeting. The headquarters of the association will be at Columbia college, and all the offices and meeting-rooms will be in the buildings of the college. The hotel headquarters will be at the Buckingham hotel, Fifth avenue and Fiftieth street, one block from Columbia college.

Under the rule which took effect in 1884, members have the privilege of registering members of their families (not including men over 21 years of age) by paying the sum of \$3 for each individual to be registered. These associate members will receive badges entitling them to all the privileges extended to members generally by the local committee.

The meeting will be called to order in general session at 10 A. M. on Wednesday, August 10th, in the library of Columbia college, by the president, Professor Edward S. Morse of Salem, who will resign the chair to the president-elect, Professor S. P. Langley of Washington. After the adjournment of the general session, the sections will organize in their respective halls. In the afternoon the sections will meet and the vice-presidents will give their addresses. In the evening Professor Morse will give his presidential address. The general sessions and meetings of the sections will be held on the following days, except Saturday and Sunday, until Tuesday night, when the concluding session will take place.

The following are the officers elected for the New York meeting: S. P. Langley of Washington, president; Sec. A, Mathematics and Astronomy—Wm. Ferrel of Washington, vice-president; Henry M. Paul of Washington, secretary. Sec. 3, Physics—W. A. Anthony of Ithaca, N. Y., vice-president; C. Leo Mees of Athens, Ohio, secretary. Sec. C, Chemistry—Albert B. Prescott of Ann Arbor, Mich., vice-president; C. F. Mayberry of Cleveland, Ohio, secretary. Sec. D, Mechanical Science—Eckley B. Cox of Drifton, Pa., vice-president; Geo. M. Boud of Hartford, Conn., secretary. Sec. E, Geology and Geography—G. K. Gilbert of Washington, D. C., vice-president; T. B. Comstock of Champaign, Ill., secretary. Sec. F, Biology—W. G. Farlow of Cambridge, Mass., vice-president; J. Henry Comstock of Ithaca, N. Y., secretary. Sec. H, Anthropology—D. G. Brinton of Media, Pa., vice-president; F. W. Langdon of Cincinnati, Ohio, secretary. Sec. I, Economic Science and Statistics—Henry E. Alvord of Amherst, Mass., vice-president; W. R. Lazenby of Columbus, Ohio, secretary. Permanent secretary, F. W. Putnam of Cambridge (office Salem, Mass.); general secretary, W. H. Petter of Ann Arbor, Mich.; assistant general secretary, J. C. Arthur of Geneva, N. Y.; treasurer, William Lilly of Mauch Chunk.

THE Richmond Company of Eureka have been putting on more men lately, and are now doing a great deal of prospecting in their mine.

MANY applications for space have been made for the forthcoming Mechanics' Fair, and there will be many exhibits from interior counties.

The New Drydock.

The Union Works Ship-Building and Repairing Plant.

The Union Iron Works, at their extensive shops on the Potrero, have given a great deal of space to the ship-building and repairing plant. They built the first steel steamer ever constructed on this coast, and have others in course of construction, in addition to the great steel cruiser *Charleston* being built for the Government. They have arranged also to do repair work of all kinds for iron and steel vessels, not only on hulls, but boilers, engines, etc. Several steamers and ships are now being overhauled and put in order at these yards at present.

One of the principal accessories to this branch of their work is the new hydraulic dock, which was used for the first time last week in lifting the steamer *Arago*. We give a sketch of this work herewith. As will be seen by the engraving, the dock consists mainly of a large platform.

The total length of the great platform is 450 feet, width 66 feet, composed of 36 steel transverse girders 6 feet 4 inches in length with top and bottom flanges 24 inches wide and 1 inch thick connected with two continuous fore and aft girders at the sides each 5 feet deep and 3 intercostal girders running the full length of the dock.

The platform is planked between the girders, making a smooth and dry working floor over the entire surface. Upon the transverse girders are arranged the hinge blocks, made of laurel and held in place with bronze clamps supplied with ratchets, and rigging to move the pawls and place the hinge blocks in position. The keel blocks are also of laurel, firmly fastened in place and supplied with dogs and appliances to adjust the same to the height required. The platform with its appliances is lifted with 36 hydraulic cylinders, 18 on each side, one opposite each end of the transverse girders. Each cylinder contains a plunger with a vertical movement of 15 feet with a lifting power of 8000 tons, more than sufficient to lift the largest vessel in these waters.

The hydraulic cylinders are supported by 72 piers, each containing seven piles 14 inches in diameter and 100 feet long. The piles of each pier are incased in a steel caisson 50 inches in diameter and 30 feet long, reaching from below the mud line to low water. The piers are capped with cast-iron covers, which carry the girders of the frame, upon which the hydraulic cylinders rest. On top of each plunger a sheave is carried, six feet four inches in diameter, and grooved for eight steel ropes two inches in diameter. One end of these ropes fastens to the transverse girders and the other to the castings, forming the base of the hydraulic cylinders. There are 288 of these ropes, each 2 inches in diameter and 44 feet long.

The 36 plungers are lifted by hydraulic power. The simultaneous motion of each is maintained by a differential valve motion. The inlet valve is operated by the rotation of a screw and the outlet by the motion of the plunger. They are compelled to move in unison. Should the plunger move faster than the nut on the screw, it opens the outlet valve. Should the screw move faster than the plunger, it opens the inlet valve wider. The screws are operated by a pair of reversible engines.

The water pressure is maintained by a pair of vertical engines, 12 inches in diameter, 16-inch stroke, making 120 revolutions, the steam to which is regulated by the operation of the accumulator, which cuts off the steam from the

engines when up and opens it when down and is entirely automatic. These engines are geared for pumps, each four and a half inches diameter and three feet stroke and making 20 revolutions per minute. The weights upon the accumulator are graduated so as to suit the weight of vessel to be raised. When the platform is lifted with its load, 72 massive steel chocks operated by hydraulic power slide into place as an additional guaranty that no accident can occur. These chocks work in harmony with the plungers, a pressure being maintained at all times on them when the dock is being used. This dock differs from what is known as graving docks, as it only has to perform work equal to the exact load to be lifted; while in a graving dock the smaller the vessel the more it costs to dock the same, as more water has to be pumped out of the dock.

The dock was designed by and built under the direct supervision of Geo. W. Dickie, the expert mechanical engineer long connected with the Union Iron Works. It represents the greatest attempt to utilize hydraulic power which has been made in the United States. The dock cost upward of \$400,000. The Union Iron Works Company are supplying every possible accessory to have their plant first-class in every respect, and leave nothing wanting to have the

production of the Rio Tinto mines next year of 3500 tons, and eventually of 8500 tons fine copper, the total last year having been about 23,500 tons. Anaconda matte, amounting to 1865 tons, arrived in Liverpool last month. It is stated that about 1750 tons of bars and copper matte are awaiting shipment at the Belco mines, in Lower California, but the present production is only about 75 tons a month, four of the furnaces having been burnt out and consequently not available.

Congress of Geologists.

It will be remembered that some time since a plan was suggested of having a uniform system of coloring geological maps, which should be the same the world over. The matter will come up before the next session of the International Congress of Geologists, which takes place in London next year.

The American Association for the Advancement of Science will meet in New York from August 10th to August 16th. At that time the American Committee of the International Congress of Geologists (a committee appointed by the American Association) will present a report concerning the position to be taken by the representatives of American geologists at the next

NEW HYDRAULIC DRY DOCK OF THE UNION IRON WORKS.

most perfect arrangements of all kinds. The new dock is convenient in every way. It is so arranged that teams can drive on with supplies of material. The largest ships and steamers can be lifted. Already there are several jobs contracted for. The large steamship *City of Peking* will soon be lifted for repairs.

Copper.

James Lewis & Sons' ore and metal report gives the stocks of copper on hand in England and France as 46,131 tons. There are 7401 tons afloat from Chili and 1200 tons afloat from Australia. This makes a total visible supply on June 1st of 54,832 tons fine. The imports of copper into Liverpool, Swansea and London from 1st of January to date aggregate 25,743 tons, and into France 4054 tons, a total of 29,797 tons fine.

The table of imports of other than Chili copper into Liverpool and South Wales for the first five months of the year shows where their supplies come from outside of the Chili imports. From the United States the imports were 2963 tons; Canada, 3; Mexico, 47; Peru, 8; River Plate, 78; New Quebrada, 1138; Newfoundland, 343; Spain, 1500; Spain (precipitate), 4828; Portugal, 156; Italy, 369; Cape of Good Hope, 2757; Australia, 27; and sundries 213. This makes a total of 14,430 tons.

Last month Liverpool received 1368 tons of fine copper from Chili and 1851 tons fine copper from the United States. The effect of the diminution of 2139 tons on the stocks, made up in the middle of last month, was neutralized by the announcement of a probable increase in the

session of the Congress upon the more important questions of nomenclature, classification and coloring, which will there be discussed. The American committee has requested that at the meeting of the American Association, Section E (Geology) set apart a day for the purpose of considering a number of these questions to be submitted by the committee, and of aiding that body to ascertain the direction of American opinion thereon. In order to better accomplish this object, the committee has asked Section E to issue an invitation to all American geologists (whether members of the American Association or not) to attend this session and participate in the work.

Dr. Persifer Frazer, secretary of the American committee, 201 South Fifth street, Philadelphia, will give any desired information. The committee announces also that an opportunity is now offered for obtaining the great geological map of Europe, now preparing by a special committee of the International Congress. This map will be issued in 49 sheets, which, combined, will cover a space of about 11x12 feet. The price is \$20 a copy, with additional charges of duty and expenses amounting to about \$6. Incorporated scientific institutions are, of course, exempt from duty charges.

THE *Chico Chronicle* says: S. M. Rogers, whose discovery of a rich mine above Powelson was mentioned some time ago, has certainly struck a big thing. In a day and a half recently he took out 93 ounces—\$1674. Who says that Butte's mining days are past?

THE Wildman mine, Sutter creek, has shown up some very rich ore recently.

The Lumber Trade.

The establishment of new towns and rapid enlargement of old ones in this State, with the consequent increase in number of buildings, is having a good effect on the lumber trade. The mills everywhere on the coast are busy and are getting better prices for their lumber than for some time past. The demand at present is larger than the supply.

This is a fact that speaks well for the general prosperity of California. The effect of this demand for lumber is one which is felt all through the lumber regions, giving employment to thousands of millmen, teamsters, loggers, swampers, etc. It is of great importance, also, to the shipping interests. A considerable fleet of ships, whose names have been for some years identified with the wheat export trade, are busy carrying lumber. Besides these ex-wheat ships are the regular coasting fleet and several steamers. Not only are the coast lumber-mills running full time, but new ones are being built to meet the call for building material. New steam schooners are being built, and those which are available are kept steadily at work carrying cargoes. Steam tugs are being employed to tow schooners, so great is the haste for cargoes. Large quantities of lumber are going to Southern California and the demand at this port and all over the coast is much greater than it has been for years. Saw-mill machinery, engines, boilers, etc., are also needed, and the dealers are all busy.

The greatest difficulty just now is in scarcity of ships to carry lumber. In addition to what we use on this coast, immense quantities are now exported. In 1886 we exported by sea 131,431,322 feet of lumber. Of this, 106,178,673 feet was sent from Puget Sound, 8,000,800 feet from Humboldt bay, 15,352,449 feet from San Francisco, and 1,100,000 feet from Mendocino. Nearly half of the total amount was sent to Australia, the rest going to South America, China, South Pacific islands, etc. The lumber trade is greatly on the increase.

Coast Coals.

All the coast collieries are running on full time to supply the demand for coal, and will continue to do so, there being very little on the way here from England or Australia. The coast collieries are getting better prices for their product than for some time. There are certain grades of foreign coal, however, needed here for which high prices will have to be paid.

Just at this time there are some 60 vessels loading coal and lumber at Puget Sound for coastwise and foreign ports. Great quantities of coal which formerly came to San Francisco now go to Los Angeles and San Diego direct and is distributed from those points. Notwithstanding this, our receipts of coal are still on the increase.

California itself produces comparatively little coal, the Mt. Diablo and Ione coal mines being the only ones which yield much. There are several other localities where a little coal is mined, and a number of prospects are being opened. The bulk of our coast coal comes from Washington Territory and British Columbia, with some from Oregon. So far, our coast collieries produce no anthracite, although up at Tacoma they expect to find this kind of coal, from known indications.

A SITE for a ten-stamp mill, to be erected at the Alta mine, on the Comstock, is being graded just north of the shaft, below the waste dump. The stamps will be operated by steam-power from the hoist engine in the shafthouse.

MECHANICAL PROGRESS.

Loss of Heat From Uncovered Steam Pipes.

A very practical test to ascertain the loss of heat from uncovered steam pipes and those covered with different coverings, was conducted by L. A. Upson, superintendent, and Chief Engineer Steele, of the Hartford Carpet Company, with the following result:

A room having a very even temperature and free from draughts or air currents was selected, close to the boilers, where steam could be taken from the top of the main pipe, and free from water of condensation. A suitable vessel was arranged to collect the water of condensation, and connected to 120 running feet of two-inch steam pipe. A short section of the pipe was inclosed in a suitable box with a glass in this side for the purpose of reading the rise of temperature, as indicated by a thermometer placed therein.

Steam was first blown through the pipe and receiver until both were free from the water of condensation which was caused by heating the pipe and receiver. The valve was then closed, and 10-hour trials made, the water carefully collected and weighed, with the following results:

Each trial as given below was for 10 hours, 120 feet of 2-inch pipe. I, pipe uncovered; II, pipe covered with asbestos, hair felt and paper; III, pipe covered with plastic material:

	I.	II.	III.
Average steam pressure (pounds).....	79	77	80
Average temperature of room (deg's)....	70	69	70
Average temperature of box (deg's).....	167	80	107
Pounds of water condensed.....	362	222	480

It will be seen from the above that the loss by radiation greatly exceeds that usually estimated for uncovered pipes, but it agrees very well with trials made upon machines carrying high steam pressures. The saving by covering the pipes is very satisfactory, and in this second trial the temperature in the inclosed box was but little higher than that of the room.

Capabilities of Foremen.

One of the good qualities, and we might as well say the necessaries, of a foreman in any kind of business, says an exchange, is his capacity for seeing into things quickly when anything about the machinery breaks down. This is the case more especially when the shop or mill is at a distance from any professional D. D. M. (doctor of machinery). But anywhere, a man quick to see *how* and *where* a machine can be fixed up and kept running with very little delay, is worth his weight in gold (so to speak). If the part is so broken that it must come out, he will be able to tell on the spot how it ought to be fixed.

Once on a time the rocker arm to a Corliss engine broke, and the engineer was wild. The pattern was got out and sent to the foundry. The foreman was in a hurry, and asked the engineer how long before he could run again, at the same time picking up the broken part. "About day after to-morrow," replied the engineer. "Well," said the foreman, "do you want me to help you to get to running inside of an hour?" "Oh, yes; but I don't see how it is possible." Taking the broken arm in his hand, the foreman went to a blacksmith shop near and shrunk a ring on the projecting parts, and in less time than he asked the engine was running as good as new. The new arm came in two days from this foundry and was thrown under the bench, where it lies now. The mended arm was better than a new one.

An engineer asked this same foreman one time to help him drill a broken bolt out of a stuffing-box, saying he "reckoned" about 11 o'clock would finish the job. After supper they "went in," and in 15 minutes the old bolt was out and this new one in, and the ratchet drill and pile of rocks carried away. How was this? Why, enough of the bolt stuck out with a thread on it to get two nuts on and make a jam nut, and the thing came out "just as easy as nothing."

There are thousands of places where quick perceptions are worth more than long-winded study. Sometimes "heroic treatment" is just the thing, but it is not every man that can be trusted to handle it.—*Exchange*.

ALUMINUM SILVER ALLOY.—Alloyed with a small per cent of silver, aluminum loses much of its malleability, but with five per cent of silver it can be worked well, and takes a more beautiful polish than the pure metal. With three per cent of silver it is very suitable for philosophical instruments, being harder and whiter than the pure metal, and is not tarnished even by sulphureted hydrogen. With small amounts of silver, it appears very suitable for scale beams, and is now frequently used for this purpose. The alloy containing five per cent of silver has often been suggested for coin of small denominations, as it is hard, bright, and retains its luster in handling.

COLORING BRICKWORK.—For staining bricks a most satisfactory red, it is recommended that one ounce of glue be melted in one gallon of water, adding a piece of alum the size of an egg, then one-half pound Venetian red and one pound of Spanish brown. The color is to be tried on the bricks before using, changing light or dark with the red or brown, and using a yellow mineral for buff. For coloring black, asphaltum is

to be heated to a fluid state, the surface of the bricks being moderately heated, and then they are dipped; or a hot mixture of linseed oil and asphalt may be made, and the heated bricks dipped in the same. Tar and asphalt are also used for accomplishing this purpose. In carrying out these operations it is important that the bricks be heated to a sufficient degree, and that they be held in the mixture so as to absorb the color to the depth of one-sixteenth of an inch.

THE INTELLIGENT MECHANIC'S LABOR.—A group of gentlemen were discussing the necessity of brain labor in some life vocations, and, after allusions had been made to several well-known citizens who were successful and prominent in their professions, one of the speakers, himself a retired merchant and influential politician, declared that Blank, naming a draftsman and inventor employed in a large machine-tool manufactory, did more brain labor than any other man in the city. Some examples were cited of well-known mechanics, and the conclusion was reached that intelligent mechanical labor required as much solid thinking as any other way. The intelligent mechanic is not a mere walking machine. Materials are not always plastic; they are sometimes perverse, and judgment and calm consideration are required in their management. The parts of a machine, however closely planned, do not come together unaided and naturally, as eyestones converge in a sancer of vinegar; it requires headwork to "assemble" the parts of a machine of any kind, and nowadays, when mechanical work requires an accuracy of proportions and a nicety of dimensions, such as were not dreamed of a generation ago, the mechanic who is not brainy in his line will surely get left.—*Ex.*

BRIDGE-BUILDING.—There is said to be more bridge-work projected at the present time than ever before at any one time in the history of the country. Two are projected across the Hudson river; six across the Mississippi; two across the Missouri; two across the Ohio, and a ten-million dollar bridge across the Potomac, 4660 feet in length, beside a multitude of smaller bridges. These bridge works are constantly overrun with work, and manufacturers of bridge iron are said to be unable to accept all the business offered. Four new bridge-building works are said to be projected. This activity in bridge-building must be taken as still further evidence of the genuineness of the era of prosperity upon which the country has entered. These prospects seem to be flattering for almost every line of manufacturing industry. The only drawback appears to be the disposition of labor to make trouble. Let us hope, however, that even this disposition will work itself out ere long, and that it will not have the effect to turn back the tide of prosperity that is evidently spreading itself over the country.

THE SHOP COUNCIL.—Mr. James C. Bayless, of the *Iron Age*, has suggested in a pamphlet the institution of "shop councils" in which employer and employee are to be equally represented—the decisions not to be binding on either party unless approved by both, and all functions to be purely conciliatory. As a means of eliminating something of the element of secrecy from the relations of the two parties, of keeping petty matters out of secret discussion and decision, it seems all that can be desired. It is the antipode of compulsory arbitration, and it avoids that suspicion which often attaches even to voluntary arbitration. It is rather systematic than remedial, just as a general disease of the pistol pocket would be an excellent accessory to a law against street combats. It is a modest proposition; but even in the din of high-sounding schemes and associations, is it too much to hope for a fair trial of it somewhere?—*The Century*.

EIGHT HOURS A DAY.—In his recent very sensible address to workmen in Boston, Edward Atkinson said, respecting the proposed eight-hour system: "If you cut down the work in factories, in workshops and in the building trades to eight hours, you cut down the product. Then there will be fewer goods, fewer stores, fewer tools, fewer houses, and that means a higher price and higher rent." This is the doctrine that has been steadfastly preached in our columns for years past. The proposition to try to make men richer by reducing the hours of labor, and so reducing the amount of wealth created, is as stupid as would be a scheme for enlarging a water-power by cutting down the milldam.—*Textile Record*.

WORKMEN STATISTICS.—Bradstreet's has compiled very exhaustive tables on the number of workmen at present engaged in the various industries of the country, the wages paid them, and other highly interesting data, and the general results shown are very satisfactory. It appears from them that at least 400,000 more workmen are engaged than at this time two years ago, and that the wages, which had sunk very low in the two years prior to 1885, are at present about the same figures they were during the bright business year of 1881-82.

TOUGHENING STEEL.—If you're working a piece of steel and want to make it exceedingly tough, melt up two pounds resin, two pounds tallow and one pound Burgundy pitch; when your work is done heat up the steel—dull red—and dip in the mixture—warm, of course.

SCIENTIFIC PROGRESS.

Is Electricity Force or Matter?

The following letter appeared in the *Journal of the Franklin Institute* for June:

Dear Sirs:—Recently I have advanced the following argument to a number of electricians, and, having failed to find any one who can adduce any good argument against it, I thought it might be of sufficient interest to be discussed in your journal. Possibly it may not be new, but I have never seen it published elsewhere.

I believe it is conceded that everything in the universe is either force or matter; therefore electricity must be one or the other. If it is matter, it must remain the same in amount, and can never be consumed or generated. If it is force, it may be generated by the expenditure of another force—as that in the energy of a steam engine—and will then grow less in amount as it is again converted into other force—as in the energy of motors, lamps, or in heating wires. Now it is a well-known fact that quantity of electricity, measured in coulombs, never is generated, never is consumed, and never does grow less in the circuit, barring leakages. The current flowing out of a lamp is exactly the same in quantity as that flowing into it, the same being true of motors and of generators, showing that electricity itself is neither consumed while doing work nor is it generated; after doing work in a lamp or motor, it comes out in precisely the same quantity as it entered. Connect only one pole of a battery to a circuit and there will be no current. Why? This battery is not able to generate quantity, or coulombs, of electricity; all it is able to do is to take the quantity which flows in at the negative pole and to send it out at the positive pole, with an increased pressure or electro-motive force. The battery, therefore, does not generate electricity, but merely raises the pressure of that which flows in. Electricity, therefore, appears to be matter, but not force. It is precisely analogous to water in a water circuit. The water is neither consumed nor generated. The pump merely increases the pressure of the water which flows in at one end; the water motor or turbine consumes this pressure again, converting it into mechanical work of another kind; it does not consume the water. The quantity of water measured in units of quantity is the same in all parts of the same closed circuit of water, just as the quantity of electricity in an electric circuit. The work which an electric current can do is due to this pressure or electro-motive force; without pressure it can do no work. The electricity in the earth is like the water in the ocean—neither can do work unless raised to some pressure or height, or allowed to fall below its normal level.

The term force is used here as distinguished from energy, as the latter term might be construed to include in it the conception of matter. But even if matter and energy constitute the universe, the above argument applies equally well. It is understood, of course, that by the term electricity, as measured in coulombs, is not meant electrical energy, as expressed in watts or joules, for it is beyond question that this latter is energy.

Perhaps it will be found, at some future time, as has been already suggested, that electricity is the ether (which is believed to be matter) whose wave motions are light, and which, in some other form of motion, is an electric current. Perhaps a current of electricity is the bodily conveyance of ether, as distinguished from a wave motion, which is energy in the form of light. In that case, I would suggest that perhaps the relative motion of the ether of space and the revolving earth may explain the cause of the earth's magnetism, the ether in motion around the earth (relatively) being an electric current producing magnetic effects. The magnetic polarity and direction at the equator are in accordance with such a theory, and the fact that the lines of force bend down into the earth at the magnetic poles may be explained by the well-known fact that lines of force are continuous circuits; they must return somewhere, and they select the axis of the earth, as there is no motion there to develop a counter-magnetism. They cannot return outside of the earth, as lines of force cannot intersect each other, and, in order to return outside of the earth, they would have to intersect. Furthermore, observations show that they do not return outside of the earth.

The only plausible arguments which I can find against the theory that electricity is matter are that it may be a combination of force and matter, as, for instance, a wave motion; or, it may be, that the real current is in the same direction in both wires leading from a machine, therefore emanating from the machine, and consequently being force or energy.

CARL HERRING.

Philadelphia, April 10, 1887.

ASTRONOMICAL RESEARCH BY PHOTOGRAPHY. Mr. Isaac Roberts reports the successful photography of the minor planet Sappho. Scarcely any observations of this planet had been published since 1872, and hence Mr. Bryant, who is engaged in determining its orbit, appealed to Mr. Roberts to find the planet, if possible, by photography. The planet is not only very small—the 11th magnitude in brightness—but its motion in an hour is equal to 4.2 times its photographic diameter, and thus the photographic trail left does not exceed in

density that of a 13th magnitude star. With an exposure of one hour the trail of this planet was distinctly recognized, and the error of the ephemeris deduced from this photograph is in close agreement with several meridian observations made about the same time at Ducrechet. This is probably the first instance in which photography has been applied for this purpose. It is a distinct demonstration that asteroids of the 11th magnitude leave strong trails on the photographic plates, and indicate that, under favorable conditions, those down to the 13th or 14th magnitudes may be photographed. Another inference suggested by Mr. Roberts is that one astronomer could, in about three years' time, photographically discover all the asteroids existing down to the 14th magnitude.

Recognition of American Research in Astronomy.

Mr. J. W. Glashier, in his recent address as president of the Royal Astronomical Society of England, on presenting the gold medal of the society, remarked that this is the second successive year in which an American astronomer has shared the honor of receiving this medal. Last year it was awarded conjointly to Prof. Edward C. Pickering, director of the Harvard College Observatory, U. S., and Rev. Charles Pritchard, D. D., Savilian professor of astronomy in the University of Oxford, for their "Photometric Researches." Unaware of Prof. Pickering's comprehensive plan, Mr. Pritchard had also taken up the subject on a large and successful scale, and hence the joint medal, upon the award of which the president took occasion to designate Prof. Pickering's photometry as a "magnificent contribution to stellar astronomy, with which his name will in future be honorably associated."

This year, Mr. George William Hill, of the *Nautical Almanac* office, at Washington, receives the gold medal of the society for his researches upon the lunar theory. On account not only of the astronomical, but also of the distinctive and elegant analytical methods employed, Mr. Glashier is justified in giving the unusually detailed review in his president's address, and which consequently becomes an interesting resume of the present condition of the theory. Among the numerous and important additional investigations of Mr. Hill mentioned are those on the motions of Jupiter and Saturn, upon which he has already been engaged for nine years, and which will probably require three or four years more for their completion. These investigations will displace those of Leverrier, which now, in the case of Saturn, fail to represent adequately the observations, and, to use the words of Mr. Glashier, will constitute "the largest and most complete investigation of the kind that has yet been performed on the American continent."

ARTIFICIAL WHETSTONES.—The *Guide Scientifique* describes the following method of making artificial whetstones: Gelatine of good quality is dissolved in its own weight of water, the operation being conducted in a dark room. To the solution $\frac{1}{2}$ per cent of dichromate of potash is added, which has previously been dissolved in a little water. A quantity of very fine emery, equal to nine times the weight of the gelatin, is intimately mixed with the gelatine solution. Pulverized flint may be substituted for emery. The mass is molded into any desired shape, and is then consolidated by heavy pressure. It is dried by exposure to strong sunlight for several hours.

CHEAP ALUMINUM.—The demand for cheap aluminum has stimulated researches in every possible direction. Mr. James MacClear, in a paper before the Society of Chemical Industry, describes a new method for manufacturing sodium and potassium cheaply. As now made according to the Deville's method, aluminum depends upon sodium. With caustic soda at \$55 a ton, the metallic sodium costs about 25 cents a pound, allowing 17 cents for fuel and materials. With sodium at this price, aluminum can probably be put on the market at \$4 a pound, or about one-fourth of its present value.

SINGULAR PHENOMENON.—A curious story comes from Mackinaw, Ill. About six miles from the town is a spot of ground about 80 feet wide that will not freeze, and snow will not lie upon it. When the earth is disturbed it will flash like burning powder. The Mackinaw *Enterprise* declares that on the coldest days of winter one could walk on this particular spot and warm his feet in a short time. A peculiar gas comes up from the ground. An effort was made to confine some of it in a bottle, but in a very little while the bottle was burst into fragments.

AN AERIAL CAR.—A New York genius has invented a "vacuum car," with which he asserts his ability to navigate the air at a high speed and drop explosives with precision upon the decks of war vessels or in fortified places. Details of the invention are lacking in the letter the inventor has sent to the Navy Department, but the matter is deemed of sufficient importance to warrant inquiry, and an ordnance officer has been instructed to communicate in person with the inventor.

CELLULERT is a new material formed by passing paper, or any fibrous form of cellulose, through a bath of nitric acid. The glutinone surfaces so produced are pressed and washed, when they form an extremely tough substance,

The Boot and Shoe Industry of California.

The boot and shoe industry is one of the most important in the State. It was one of the products of the war. Before the war California shipped her hides by sea to Boston, and took them back in the shape of boots and shoes. When the depredations of rebel privateers rendered the high seas unsafe, the hides were kept here and rotted. To use them up tanneries were established, and subsequently shoe-factories, the labor employed in these latter being chiefly Chinese. Thus before the close of the war San Francisco had the credit of making the best mining boots worn in the United States. She has never lost that reputation.

As a general proposition it may be said that the trade of San Francisco in boots and shoes represents an annual value of \$6,000,000 to \$7,000,000. We manufacture about \$3,500,000 worth, and we import from the East—Massachusetts, New York and Pennsylvania, the lion's share belonging to Massachusetts—about \$3,000,000 more. These goods are not all consumed here. We supply Oregon, Washington Territory, Idaho, Montana, and to a certain extent British Columbia, on the north; Nevada, Utah and Wyoming, on the east; Arizona, New Mexico and parts of Old Mexico on the south, besides such islands as the Sandwich and several islands off Polynesia. The trade is constantly growing and cannot be taken away from us, simply because we make a better and cheaper boot than can be made elsewhere. In the East there are good shoemakers. Lynn turns out some conscientious work. But neither in the very cheap and coarse grades, nor in the very fine grades, which are the two classes of boots we import from the East, can it compete with the best work of this coast. We make a better boot for less money. Why this is we cannot explain. But neither can any one explain why California makes better blankets than New England. We must be content with the fact.

There were received in San Francisco, in 1836, 73,077 cases of boots and shoes, against 42,066 in 1835, 40,508 in 1834, 55,501 in 1833, and 65,958 in 1832. Of hides, 190,676 were received last year, 178,589 in 1835, 190,368 in 1834, 223,941 in 1833, and 269,431 in 1832. The main source of supply is the Pacific slope, whence 150,018 were obtained last year. The Hawaiian islands sent 16,304, and Mexico, 13,660. The market during the year, especially the latter part of it, was very steady. It opened at 9½ cents for wet salted and 18 cents for dry, and closed at 9½ cents for the former and 16 to 16½ cents for the latter. The receipts of leather for 1836 were 5,223,660 pounds, against 4,466,740 pounds in 1835, 4,695,470 in 1834, 5,459,840 in 1833, and 5,957,070 in 1832. It will be seen that the receipts last year were the largest since 1833. Prices in 1836 were five per cent less than in 1835, and as much money was made in the later as in the earlier year. The Northern and Southern California trade has been good. Los Angeles buys largely in the San Francisco markets of sole and harness leather.

THACKERAY'S HATRED OF HYPOCRISY.—Of course in all families the mother is the one to whom the children cling. We don't talk to them, feel with them, love them, occupy ourselves about them as the female does—we think about our business and pleasure, not theirs. Why do I trouble you with these perplexities? If I mayn't tell you what I feel, what is the use of a friend? That's why I would rather have a sad letter from you, or a short one if you are tired and unwell, than a sham gay one, and I don't subscribe at all to the doctrine of "striving to be cheerful." *A quoci bon*, conclusive grins and humming-god humor? Let us have a reasonable cheerfulness and melancholy, too, if there is occasion for it, and no more hypocrisy in life than need be.—From "Unpublished Letters of Thackeray," in Scribner's Magazine.

CARRION AND CONTAGION.—The *Chronicle* makes a pertinent paragraph applying Ohio experience with the distribution of hog cholera from the dropping of choleric pork from unhurried carcasses by crows. This infested substance may fall in fields where healthy animals are pastured and infect them with the cholera germ. The preventive is, of course, to bury dead animals beyond reach of carrion-eating animals which might bring it to the surface for carrion birds to fly away with. Attention is called to the numbers of carrion birds on this coast, and therefore the greater danger of distributing infection. It is desirable either to burn dead animals, or, if this be not easy, bury them deeply. This will make the air purer, as well as guard against evil work by the birds.

A WARNING TO NIBBLERS.—A young man in Healdsburg, the other day, stepped into a business house, and seeing some wheat lying on the counter, picked some up and ate it. Noticing a peculiar taste left in his mouth, he turned to the proprietor and inquired the cause. Imagine his consternation when he was told that the wheat had been soaked in a solution of poison for the purpose of killing squirrels. Emetics were quickly administered and the young man's stomach relieved of its dangerous contents before any serious results were experienced. This should be a warning to all those who are in the habit of tasting things carelessly.

USEFUL INFORMATION.

DIAMOND INK—A VALUABLE PREPARATION.—The preparation for writing on glass, called "diamond ink," is to be used with a common pen, and at once etches a rough surface on the parts of glass it comes in contact with. It proves to be a very useful article for labeling bottles which are to contain liquids that will destroy common labels. At the request of Professor Maisch, an analysis was made which proved it to be ammonium fluoride, barium sulphate and sulphuric acid. The barium sulphate seems to act as an absorbing medium, and when this semi-fluid mass is used it makes a white mark and prevents the spreading of the watery liquid; it also seems to make the acid etch a rougher surface. It is made by mixing barium sulphate three parts, ammonium fluoride one part, and sulphuric acid a quantity sufficient for decomposing the ammonium fluoride and making the mixture of semi-fluid consistency. The sample examined was contained in a glass bottle holding nearly two fluid drams, and which was thickly coated on the outside with asphaltum, on the inside with a thick stratum of beeswax, and was stoppered with a rubber stopper. It is claimed by the manufacturer that the mixture contains no hydrofluoric acid and does not corrode a pen; but of course it does corrode a pen, and hydrofluoric acid is the one thing that does the etching. Any one making this mixture and wishing to keep it in a glass may coat the bottle inside with paraffine, beeswax or rubber. It should be prepared in a leaden dish and is preferably kept in a gutta percha or leaden bottle.

PRESERVATIVE QUALITIES OF SEA-WATER.—The capability of sea-water as a preservative is shown by the fact that among the articles recovered from vessels sunk in the harbor of Vigo, Spain, in 1702, there have been recovered specimens of logwood and mahogany that, notwithstanding their 184 years' submersion, are in the most perfect state of preservation. The mahogany, too, is very fine and solid, one log 12 feet long and 22 by 32 inches square being subsequently worked up in the shape of furniture and walking-sticks as mementoes. The chief object of interest, however, is an ancient pulley block 4½ feet high and 3 feet broad, with four solid copper sheaves 18 inches in diameter. It is of solid oak, and was probably used in hoisting heavy articles of merchandise or the anchors. The wood is perfectly preserved, but an iron band is completely corroded away, while the copper wheels are but slightly oxidized.

DEALING WITH LARGE MASSES OF STEEL.—The steel manufacturers of England, who have never yet failed to produce any work called for, have recently begun to make extensive preparations for dealing with still larger masses of that metal, mainly by means of the forging press. Messrs. Watson, Moorwood & Co., of Sheffield, have recently manufactured a huge anvil block, weighing 35 tons, constructed so as to withstand an enormous pressure. Taking into consideration the great size of the casting, it is said that the work has been admirably executed. A second anvil block has also been manufactured, and at last reports was undergoing the cooling process. Messrs. Bolckow, Vaughan & Co. have set up works which allow of their production of plates up to 3 tons in weight, 40 feet in length, 8 feet in width and 4 inches in thickness. The plates are constructed of basic steel.

CARRIAGE PAINTING.—A correspondent of the *Carriage Monthly* asks the editor for a good recipe for mixing body rough-stuff out of Reno's umber and orange. The editor applied to Reno Bros. for the information, and their response contained the following recipes, with the further remark that many painters had various ways of mixing rough-stuff, the rules below being as near right in general use as any: For rough-stuff, take equal parts of good japan and coach rubbing varnish. Pour together and add enough of the French number filler to bring it to the consistency of a thin paste. Thin with thin turpentine. For priming and lead coating, use French number filler. Mix with oil to the consistency of keff white lead, and use the same as lead. For putty and glazing, mix with japan and varnish to the consistency required.

GLASS FLOORING.—The substitution of glass flooring for boards continues to increase in Paris, this being especially the case in those business structures in which the cellars are used as offices. At the Bank of the Credit Lyonnais, the whole of the ground in front is paved with large squares of roughened glass, embedded in a strong iron frame, and in the cellars beneath there is sufficient light, even on dull days, to enable the clerks to work without gas; and, although its prime cost is much greater than that of boards, glass is, in the long run, far cheaper, owing to its almost unlimited durability.

EARLY USE OF MAHOGANY.—It is said mahogany was first known to Europeans through the fact that Sir Walter Raleigh, when at Trinidad, in 1595, used planks of it to repair one of his vessels. The samples thus carried to England were much admired, but for over 100 years it was put to no practical use. In 1720, however, a Dr. Gibbons, of London, received a few mahogany planks from a friend in the West Indies, and employed a cabinet-maker to work them up. From that time to the present the

wood has been a staple article of commerce. So far, the supplies have practically all come from Spanish America, but there is some possibility that other sections may contribute to the supply. Mahogany, though of an inferior quality, has been shipped from Africa, and certain parts of India have proved to be adapted to its growth. Mahogany is of slow growth.

WILD GESE DESTROY A KITE.—A harrow-shaped flock of wild geese, the Waterbury, (Conn.) *American* says, went northward over the city recently. They seemed to attend sharply to the business of traveling until they spied one of the numerous kites the boys in the northern portion of the city were flying. This kite was uncommonly high in the air, and the geese objected to it. At least they circled about it two or three times, and then four of their number, delegated for the purpose, attacked the kite and tore it into shreds, and went on their way.

STEEL OARS.—Yates & Co., Birmingham, are making an oar in which the blade is made from the best sheet steel, highly tempered. It is said to be much stronger than the ordinary wooden one, and cannot be broken without undue violence. The handle fits into a socket running nearly the whole length of the blade, and forming a backbone of great strength. The oar being much thinner in the blade than the wooden one, enters and leaves the water cleaner. The handle is made separately, of the ordinary spruce or ash, and if broken can be readily replaced.

SMELTING BY RADIATED HEAT.—Dr. Werner Siemens' new copper works in the Caucasus have a furnace in which the heat is derived solely by radiation from petroleum and steam spray flames. These flames are not in contact with the walls of the furnace at all, and everything depends upon radiation; but the naphtha or petroleum employed will melt from 15 to 20 times its weight of ore. Dr. Werner Siemens says that it is the first large smelting furnace in which the Siemens radiation method has been applied in practice on a large scale.

TO FILL CRACKS IN FLOORS.—A very complete filling for open cracks in floors may be made by thoroughly soaking newspapers in paste made of one pound of flour, three quarts of water and a tablespoonful of alum, thoroughly boiled and mixed. Make the final mixture about as thick as putty, and it will harden like papier mache. This paper may be used for molds for various purposes.—*Cal. Architect.*

For some time past builders in Germany have resorted to the use of a composition of cork, sand and lime, molded into bricks, for the construction of light partition walls. This is said to exclude sound better than ordinary brickwork, while being light and a good non-conductor of heat.

RUBBER JOINTS.—In making rubber joints, chalk the rubber well before screwing up the flanges—it will always come apart easily, and can be used many times even if hard by renewing the chalking.

GOOD MEALTH.

The New Treatment for Consumption.

A novel method of treating patients suffering from phthisis is described in a recent number of the *Medical Record*. It was devised by a French physician, Dr. Bergeon, of Lyons, who has been applying it for two years to cases of chronic pulmonary and throat diseases. The results are said to be remarkable. In acute general phthisis there has been an arrest of the progress of the disease and a cure in a few months. In advanced consumption marked improvement of symptoms is rapidly secured, night-sweats ceasing and the cough becoming less harassing. Two hundred cases have been treated with singular success by Dr. Bergeon in Lyons, where the climate is unfavorable for consumptives. His method has been introduced in the hospitals there and in Paris, and the medical authorities are favorably impressed with it.

The treatment consists of daily injections by enema of medicated gases. Carbonic acid gas when introduced into the system by this method is found to be painless and harmless. Sulphureted hydrogen is mingled with it, the entire structure of the lungs is permeated by the medicated gas, and remarkable curative effects are observed. The carbonic acid gas is practically inert when taken up by the veins of the intestines, but the sulphurous gas reaches every particle of diseased tissue in the lungs and throat, which is eliminated from the system in the process of expiration. The volume of gas used is very large. At the outset a single litre is introduced, but the quantity is rapidly increased to 10 or 12 litres for each injection.

The results of this new system of treating consumption are so well vouched for that we commend the subject to the critical examination of medical circles in this country. Consumption is the chief scourge of the Atlantic seaboard. Any departure in therapeutics so radical as this French method deserves to be thoroughly investigated and adequately tested in American hospitals. Dr. Bergeon is not a smatterer in medicine, but a reputable physician of large practice and good standing. If

his method be as effective and successful as he asserts, it merits general attention from the profession in the United States.—*New York Tribune.*

THE GERM THEORY OF DISEASE.—The theory that many diseases are produced by microscopic germs is generally supposed to be wholly a modern one; but some book-worm has recently unearthed the fact that the first statement of the theory was really published more than 150 years ago, by Doctor Guiffon. In a work by this author, entitled "Origin of the Plague," published in 1721, he says: "Minute insects or worms alone can explain these diseases. It is true they are not visible, but it does not therefore follow that they are non-existent. It is only that our microscopes are not at present powerful enough to show them. We can easily imagine the existence of creatures which bear the same proportion to mites that mites bear to elephants. No other hypothesis can explain the facts. Neither the malign influence of the stars, nor terrestrial exhalations, nor miasmata, nor atoms, whether biting or burning, acid or bitter, could regain their vitality, once they had lost it. If, on the other hand, we admit the existence of minute living creatures, we understand how infection can be conveyed in a latent condition from one place to break out afresh in another."

PHYSIC-TIFFLING AND MEDICINE-BIBBING.—At a recent State Sanitary Convention, held in Philadelphia, Dr. Frank Woodbury of that city read a paper with the above title, in which he referred to the rapid increase in the consumption of such drugs as the bromides, chloral, opium, etc. It is said that of chloral hydrate, one ton a day is consumed in England and America. He then spoke of the causes of this increase. A large portion of the death-rate among children was attributed to the abuse by the parents of medicines acting on the nerves. The injurious effects of patent medicines were considered. The author advocated as a remedy for this growing evil, "the instruction of the public to properly estimate drugs, and to regard every unknown medicinal agent as dangerous and endowed with capacity for harm. Let them escape the caustic criticism of Moliere upon those who pour medicine about which they know little into bodies about which they know less, in order to cure disease about which they know nothing at all."

HYDROPHOBIA FROM MILK.—It has not hitherto been known that hydrophobia may be communicated through the medium of milk; but from the following note from the *Anti-Adulteration Journal*, it appears that the disease may be communicated in this way: A dog belonging to A. J. Hall went mad last week, and among the animals which it wounded in its wanderings about the farm was a milch cow. The cow showed no signs of being affected by the wound. Later, however, the animal began showing symptoms of hydrophobia, and at the same time the farmer's two little children, who had been nourished with the cow's milk, exhibited similar symptoms, and are in a most critical condition, suffering the most terrible agonies. The other members of the family are also ill, but their symptoms are not so alarming, and hope is expressed that they may recover.

DANGER FROM HOUSE PLANTS.—Dr. Sanbury found malarial fever to be propagated among persons sleeping in a room in the windows of which had been placed a box of earth from malarious soil. House plants cultivated in pots filled with malarious earth are a constant danger. The germs grow luxuriantly in the moisture and warm air of closed rooms. Dr. Eichwald, Professor of Clinical Medicine in the University of St. Petersburg, has given to the public facts concerning a patient of his—a lady with malarial fever—who was easily cured by treatment when confined to her chamber, but who quickly relapsed on remaining during the day in her parlor. The easy cure and constant relapses went on for a long time. At last the doctor, having become suspicious of the flower-pots, removed them from the house, and there was no further recurrence of the disease.

BACTERIA.—It has been estimated that a single cubic inch of space will contain 8,000,000,000 of these little fellows, of average size. They also increase, by fission, at the rate of one division every hour; hence, a single one becomes the immediate parent of 16,777,215 every 24 hours, and the causative parent of 32,307,756 individuals in that length of time. Now, as each one of these 32,000,000 will become, during the next 24 hours, the hegetter of 32,307,756 individuals, one can get a reasonable understanding of the virulence of some of our infectious diseases where there is a specific bacterium.—*Sel.*

THE LIFE-HABITS.—The life-habits of people who have come to be centenarians are described in an interesting article in the *British Medical Journal*. Activity, out-of-door exercises, and early rising with moderation in diet, seem to be the most important factors of longevity. Few things tend to promote health and vigor more than activity—activity without excitement—an activity which does not wear the body out. The candle ought to burn briskly, and, as a general rule, at both ends, regarding the head or brain as one and the limbs or locomotory agents as the other; but it should not burn too fast.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH.—Cor. *Amador Dispatch*, June 18: It is reported that the Alpine mine has been sold to an English company for \$80,000. The mine has been resurveyed and work commenced. It is the intention to sink a new shaft on the ledge, east of the old shaft. The New London is pushing ahead with its second shaft, which is now down about 100 feet. Everything about this mine is booming, showing the pluck and energy of the owners. The Empire and Pacific are running 160 stamps and still hold the imperial star in the production of bullion in the Golden State. The mining outlook for Plymouth and vicinity is that of rapid progress, and it will not be long before northern Amador will show the outside world that we surpass all other mining camps in abundance of rich ore and production of bullion.

EL DORADO.—*Ledger*, June 18: This quartz claim is located near Amador City, and adjoins the Median on the south. It is owned by Dr. T. H. Mayon, who has prosecuted its developments as rapidly as his means will allow. A shaft was sunk a couple of years ago, 290 feet, and a drift was started south. The developments were highly satisfactory, when work was suspended for lack of means. Lately operations have been recommenced and the drift has been extended 125 feet from the shaft, in ledge matter all the way, and apparently widening as progress is made. At the face of the drift the ore body is 7 feet wide, and the rock is of that dark-streaked ribbon quartz which is the infallible indication of a healthy gold-producing ore. The quartz is similar to that of the South Spring Hill and Keystone. Assays made from the average grade of ore gave a result of \$12.45 per ton. From its appearance it ought to yield from \$8 to \$10, by mill process. It is the intention of Dr. Mayon to erect a mill on the property this summer, if possible.

MISCELLANEOUS.—The Original Amador was started again last week, and the Bryan roller-mill is running full blast. The rock is coming from the shaft, and is said to give better results than that first crushed. The mill reduces 10 tons per day. The Alpine mine at Plymouth has been started by an English company, after a long period of idleness. A gentleman representing the English owners, arrived in Plymouth a couple of weeks ago, and at once made preparations for the resumption of work. A few men were put to work this week in starting a new shaft.

Calaveras.

WEST POINT MINES.—Cor. *Calaveras Chronicle*, June 18: The mining boom here rules the hour, and is attaining greater proportions as time progresses. Never in the history of the camp has there been witnessed such a stir in mining circles, thus proving to the world that this granite camp contains some of the richest mines in the State, and that to-day it is the liveliest mining camp in the county. A company has been organized, with a capital of \$500,000, to erect reduction and chlorination works here. The site has been selected near the town.

LOCKWOOD MINE.—Development is still progressing in this mine. Three hoisting works are kept in motion. The south level of the north shaft is now 180 feet in length, with four-foot ledge in face. The size of ledge in this level ranges from two feet to 6½ feet in width, with an average value of \$100 per ton. South shaft contains an ore body of sulphurets 150 feet in length; value of ore \$150 per ton. This is the chief mine of the district.

BLAZING STAR is proving itself second only to the Lockwood. The mine was purchased by Moore & Co. of San Francisco, last March, from George Eberhardt, the price paid being \$3500. Mr. C. W. Watkins took hold and commenced sinking a double compartment shaft on the first of April, and after the shaft had reached a depth of 60 feet, a 30-horse power engine was placed in position and sinking again resumed. The shaft is now 140 feet in depth, with 60 feet of backs. The ledge in the shaft is two feet in width; value of ore ranging from \$200 to \$3000 per ton.

KELTZ.—Work of extracting and shipping ore from this mine continues. Value and volume of ore in stopes and lower levels show no diminution. This mine pays its regular dividends. Twenty men are employed.

SCORPION.—The work of stopping good ore is kept up at this mine, and the five-stamp mill is kept constantly in motion. A splendid body of ore has been struck in the north level, which adds greatly to the value of the mine. As sinking of 200 feet will be commenced in July, 200 tons of concentrations have accumulated from the new mill. They will be worked by the new reduction works.

EASTERN BOUNDARY.—This mine is near the Keltz. They have a shaft 150 feet in depth, with good backs. Stopping has been commenced, and is turning out splendid ore. Some of the sulphurets will assay as high as \$600 per ton. They employ 12 men.

SOAP ROOT.—This mine is owned by John Henry, and has a first-class record. Mr. Henry has bonded the mine to a San Francisco company for \$12,000. Thirty tons of sulphurets were worked at Selby's Works, Vallejo Junction, last summer, which netted \$3970, and the best ore may be found in bottom levels. The New Tucker has been bonded to Moore & Co. A large shaft is being sunk, over which first-class hoisting works will be erected in addition to a Stewart pulverizer. The Water Lily has been bonded for \$20,000. The shaft is 140 feet in depth. The Sterling mine, owned by Henry Sterling, has been bonded. Good hoisting works will be erected. This mine, like the Water Lily, is situated close to the Blazing Star. The Riverside mine, owned by Frank Ochoa, has been bonded to a S. F. company for \$5000. This mine has a splendid record. The Texas mine, owned by L. Davidson, has been bonded for \$3000 to certain parties from San Francisco. This mine is located near the Riverside. The Austrian John mine was sold for \$2000 cash down, to-day, to Knox Bros., of San Francisco. They will put up hoisting works on the mine. There is a splendid sulphureted ledge in bottom of main shaft.

MINING REVIVAL.—*Calaveras Prospect*, June 18: The town of Copperopolis is about to undergo a

mining revival. The Union copper mine is to be pumped out with the object of working the mine. The copper interests in that section are valuable. The Burger mine at Campo Seco is looking well of late. Last week a new Burleigh drill was put into the mine, and a good cleanup is expected in the mill this month. The gravel claim between El Dorado and Cave City has suspended operations until next fall. The cleanup at the Wyllie claim netted over \$3000. The Riley Bros. made equally as good a cleanup in their claim. Geo. Babcock, a well-known mining expert, who has mining property in Railroad flat, has bonded the Phillips mine, near Gwin mine. This gentleman was at Valley Spring last week, and while there, visited the Emma mine, of Plummer, Bratton and Brown, and was well pleased with prospects, and says the proprietors have a good mine. Messrs. Plummer, Brown and Bratton have a fine prospect for a quartz mine, one and one-half miles from Valley Spring, near Chili camp. They have been working since January last. There is a shaft 40 feet, and a drift 70 feet. The vein averages about 3½ feet in the shaft and drift. The owners have some fine specimens they have taken out lately; only last week a fine body of ore was struck in the drift, which contained considerable free gold.

NEVILLE MINE.—*Mountain Echo*: On the 400-foot level work has but recently been commenced in the drift running south. The drift is in good ore 80 feet, and particularly in the end where stoping has just commenced the ore has been found to be of a high grade, carrying free gold and sulphurets far superior to that found on the upper levels. At this point walls on either side have not been reached, but as far as developed a well-defined ledge, 15 feet in width, is presented. The ore lies in strata enclosed in narrow casings of slate varying in width from one-half to two inches and of a green-stained character. The best ore taken out of the mine is now being extracted on this level, a fact which plainly shows that the ore increases in richness as the mine goes down. In the south end of the 300-foot level stoping is going on actively. The stopes are opened up in good shape and the Burleigh drills are doing considerable execution. On the 200-foot level stoping is going on briskly in the north end. Considerable work has been done in the stopes of this level in the way of filling in with waste and surface earth as the ore is extracted. Material from above for filling in is transmitted through an upraise recently made to the surface. Filling in is going on quite lively, thus necessitating little or no timbering. This method of securing the mine is in itself a great saving in the cost of timbers, and in fact makes the mine safer and at the same time keeps the ore body in reach so as to be worked to advantage with the Burleigh drills. The shaft, from the surface to the 400-foot level, is in ore the entire depth, there being sufficient now in sight to keep the 20 stamps running for ten years, to say nothing of what lies beyond the 400-foot level. The mine is paying a handsome dividend. There are 35 men on the payroll at present.

Mono.

ORE.—Cor. *Inyo Register*, June 18: Up the Furnace canyon Hugh Jones is preparing to ship a carload or two of ore. Somerville & Buechler also have about a carload ready from the Coalburner. At Montgomery John Schlummer is taking out some rich ore from his mines. Returns from a shipment made a few weeks ago by him to the Reno Reduction Works were very satisfactory.

Nevada.

DELHI.—North San Juan Times, June 18: We saw a gold bar at D. Furth's store the other day from the Delhi which was worth \$9000. The gold was taken from the screens only of the Delhi mill during the run from June 1 to June 9, inclusive. The receipts from the Delhi for May amounted to \$22,100—obtained from an 8-stamp mill at a working expense of \$1400 only. With a 40-stamp mill, it is fair to presume, the receipts for the month of May would have been five times greater than they were.

PROSPECTING.—*Nevada Transcript*, June 18: Our correspondent at Omega sends us the following interesting mining items: There is a boom in prospecting for quartz in this section, in fact in the whole township "the woods are full of 'em," and all sure of a fortune. S. O. Pease & Co. have a big ledge showing fine-looking quartz. Jas. Teramer and Mr. Eastman have just started a tunnel to strike a big ledge located a short distance south of the Chase hotel at this place. A. Tregidgo & Co. have finally purchased from Towle Bros. of Alta the fine 20-stamp quartz-mill formerly erected on the Celia mine at this place, and on Monday last commenced tearing it down preparatory to removing it to the old Baker mine on the Yuba river, opposite the mouth of Canyon creek. At this mine there is now on the dump not less than 500 tons of fine-looking ore ready for crushing. The mill now being moved to the mine will be rushed to completion. Mr. Tregidgo is also engaged in putting up hoisting works on the Blue Bell mine farther up the river. A good deal of prospecting is being done on Canyon creek. There are a number of good-looking ledges there, but none sufficiently developed to show real value as yet, with the exception of B. J. Watson's mine. He has some fine-looking ore on the dump and a shaft down on the ledge over 160 feet deep, carrying a fair sized vein of ore all the way down and favorable-looking rock. All indications are favorable for its making a good paying mine. Messrs. Kohler & Harris of Washington have fine prospects on the creek not far below Watson's mine. On Gaston ridge Messrs. Cole & White, residents of Washington, have a rich find. They have a shaft down on their ledge only about 20 feet, the rock showing very rich in free gold and galena. The lucky owners have already had an offer of \$10,000 for their property, which was refused.

Placer.

FOREST HILL DIVIDE.—*Placer Herald*, June 18: Supt. Dodge reports that gravel was struck in the upraise of the Baker Divide tunnel last Sunday night, 330 feet above the tunnel. So far they have been unable to prospect on account of water. A horizontal drift will be run to lead the water off. The tunnel is in 2400 feet. Mr. Dodge thinks it will have to be extended 1000 feet, as the bedrock pitches away from them at a very small angle according to present indications. The finding of gravel at Red Point, and by the Baker Divide Co., opens a new era in mining on the Forest Hill Divide. These two tunnels were run to test the theory that an old channel

followed the trend of the Divide from a point above Damascus down to the Mayflower mine; and the striking of gravel in both has proved the theory to be correct. The successful issue of these two costly undertakings will encourage other companies, invite capital and population, and place the old Divide in the front ranks of rich mining centers.

San Diego.

MANGANESE.—*Julian Sentinel*, June 17: We were shown a sample of black manganese in McNamara & White's office, San Diego, which has all the appearance of warranting a very rich claim in the vicinity of the Cuyamaca.

Shaeta.

LOWER SPRINGS.—*Reading Free Press*: The Eureka, Eastern Star and White Oak mines are the only ones being prospected at the present time. Prospectors have fallen off during the past month. Their anxiety to find good mines with little or no labor has worn them out. At the bottom of the shaft in the Eureka mine, some very rich ore has been encountered. The shaft is down 40 feet, pitching at an angle of 30 degrees. Fifty feet north of the croppings on which the vein is being done, runs the main ledge, and pitches at an angle of 65 or 70 degrees—both running parallel with each other, and both pitching north. While sinking the above-mentioned shaft, six tons of ore were extracted, three tons assaying on an average of \$239.40 per ton, and some of the ore at the bottom of the shaft is equally rich.

Sierra.

EMPIRE.—*Mountain Messenger*, June 18: The Empire Mining Co., at Gold Valley, are working from 25 to 30 men putting up buildings, etc. They have just got their new sawmill started, and will now be able to supply lumber as fast as it is wanted. L. Foss has bought an interest of D. E. Williams in the quartz claim, situated on the hill above the old Frank Beaver place. The Grand Hill Drift Mining Co., near Gibsonville, has found gravel that pays \$3 per carload. Cox, Gourley and others are the owners. The thousand-foot contract at the B. M. Ex. new tunnel, three miles up the ridge above Forest City, is about completed. Good paying gravel has been found in the Bunker Hill claims at Little Grizzly.

Sonoma.

THE CHROME IRON MINE.—*Sonoma Democrat*, June 18: Six men will be employed in opening the chrome iron mine deposit on the Yarbrough ranch, near Guerneville, next week. Mr. Ludwig is firm in the belief that he is the owner of a rich mine, and if such proves to be the case, it can be said to be the most advantageously located for shipping facilities of any in the State.

Trinity.

LEASED.—*Journal*, June 18: We understand that San Francisco parties have leased the Blythe mining property above Trinity center for five years, with the privilege of purchasing at the expiration of the time for \$35,000.

MINE BONDED.—Messrs. J. H. Underwood and G. W. Tinsley have bonded the Taylor flat mining property to Mr. Wm. H. Vaudray, of Manchester, England. The bond runs till December, and 20 per cent of the purchase price was paid on the bond. The Van Matre Bros. have recently made a satisfactory crushing of rock from the Last Chance which they have leased, and are reported to have made another rich find in the same mine.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—*Enterprise*, June 18: On the 130 level a west crosscut (No. 2) from the south drift was advanced 35 feet; total length, 234 feet. This crosscut continues in quartz and vein material. Are still continuing the upraise above the northeast drift which is intended for an airway. On the 1400 a west crosscut (No. 3) started in the Consolidated Virginia shaft was advanced 25 feet; total length, 48 feet. The north drift started from the bottom of winze No. 1 has been advanced 30 feet; total length, 150 feet. This drift still continues in low-grade ore, containing streaks of fair quality. Still extracting the usual amount of ore from the new south stopes. Have discontinued injecting carbonic acid gas. It is supposed that the fire that was smoldering in the bulkheaded portion of the mine is now extinguished, and this part of the mine, so long closed, will soon again be opened up for the extraction of ore. The usual amount of ore has been shipped to the mills on the river, the assays of which are about the same as heretofore.

SAVAGE.—Are extracting ore on the 500 level. The west crosscut on the 8th floor above the 600 level has been advanced 20 feet, and the east crosscut on the 5th floor of the same level has been extended 18 feet. No. 6 west crosscut on this level was advanced 24 feet, and the drift south from this crosscut is now extended 35 feet in the quartz body. A drift has been started west from the shaft station of this level, and also on the 800 level. On the 1200 level No. 3 west crosscut was extended 25 feet, and is now 290 feet in length. Its face is in heavy black clay. No. 3 east crosscut on this level was advanced 26 feet. In No. 2 west crosscut on this level have commenced upraising in the ore body, and have hoisted therefrom 17 tons of pay ore.

GOULD AND CURRY.—On the 300 level the north drift from the main west drift was advanced 40 feet; total length, 162 feet. This drift continues in quartz showing value. On the 250 level operations are confined to running drifts in various directions through the old stopes. On the 625 level the east crosscut from the main south drift was advanced 10 feet; total length, 364 feet. From the bottom of the winze the east crosscut was advanced 15 feet; total length, 67 feet. From the end of this crosscut north and south drifts have been advanced; the former 12 and the latter 15 feet. Some small streaks and bunches of good ore are being found in this part of the mine. Good headway is making in the work of repairing the two south compartments of the main shaft.

OVERMAN.—Are extracting about the usual quantity of ore from the level of the old Petaluma-street tunnel. A part of the Brunswick mill has for a time been run on Overman ore. A considerable amount of exploring work is being done, and the chances are good for opening up some considerable deposits of good milling ore.

OCCIDENTAL.—On the 200 level from the end of the south drift a west crosscut was advanced 20 feet;

total length, 42 feet. The face is in a mixture of porphyry and quartz of a favorable appearance. On the 100 level the south drift from the north incline winze was advanced 15 feet; total length, 193 feet. This drift is in quartz showing spots of ore that will pay to save.

ALTA.—The north drift on the 825 level still continues to cut streaks of fair ore. Good progress is being made in the sinking of the winze in the south drift on this level. The bottom is still showing ore of a fine quality. Ore of a good grade is still found in the drift running south on the 725 level.

NORTH OCCIDENTAL.—Work will presently be commenced through the Occidental; also from the Suro tunnel, which cuts the vein at a depth of 1300 feet below the surface. There is known to be in the mine much ore that will yield a profit at the present low prices for milling.

BALTIMORE.—A considerable amount of good milling ore is being taken out of the upraise from the 300 level. Good ore is also being taken out on the 400 level. The north and south prospecting drifts on the 300 level are progressing as usual, but as yet no crosscuts have been opened.

YELLOW JACKET.—Are extracting 200 tons of ore a day, which is being reduced at the Brunswick and Vivian mills. The ore-producing sections of the mine continue to yield and look well. A good deal of prospecting is being done in the old upper levels.

OPHIR.—On the 1300 level north winze No. 1 was sunk and timbered eight feet; total depth, 58 feet. From the bottom of this winze have started a west drift following a streak of ore running in that direction. This ore is being extracted for milling.

CROWN POINT.—Are extracting 130 tons of ore a day, which is being worked at the Mexican mill. The ore-producing sections continue to look well. The work of exploring on the streaks of ore found between the 300 and 400 levels is still continued.

HALE AND NORCROSS.—Have resumed work in the west drift on the second station (700) level and advanced it 35 feet. A portion of the force of miners has been engaged in retimbering the shaft between the 1100 and 1200 levels.

CHOLLAR.—No ore is at present being extracted, but many good deposits have been opened up at several points. Many exploring drifts and crosscuts are being run. They will be able to extract ore very rapidly when they begin milling.

HAYWOOD.—All the ore is being extracted for which crushing facilities can be found. Large bodies of ore have been opened up and await extraction. The Thompson mill is still steadily at work upon ore from the mine.

ANDES.—Good headway is making in the drift started north last week from a point 60 feet below the 240 level. It still continues in quartz, carrying some streaks of ore. The west crosscut on the 240 level is still in vein material.

BEST AND BELCHER.—On the 1500 level west crosscut No. 1 was advanced 50 feet; total length, 171 feet. The face of the crosscut is in a mixture of vein material, consisting principally of porphyry and quartz.

BELCHER.—Are taking out 100 tons of ore a day, which is being reduced at the Santiago mill. There are large deposits of ore in sight, and prospecting is continued at several points in the old upper levels.

IOWA.—The ore-producing sections of the mine are all looking well. There has been some trouble with the crushing machinery—particularly with the self-feeders—but all is now reported running well.

KNICKERBOCKER.—This old Comstock favorite is to be started up again and opened in good shape, under the superintendence of W. E. Sharon. Work will be commenced at once upon the machinery.

BULLION.—The east drift on the 300 level has been advanced 20 feet. There is no change of material in the face. A considerable amount of water is showing in the west drift on this level.

LADY WASHINGTON.—The face of the north drift on the 725 level continues in milling ore of fair grade. At this point there seems to be a large body of ore that will pay well for milling.

HENDRICKS.—The first prospecting work will be done at the 500 level, where quartz was found that gave good assays at the time A. G. McKenzie had charge of it as superintendent.

SCORPION.—On the 300 level the east drift is now out 500 feet east from the shaft, having been advanced 29 feet since last report. The drift continues in vein porphyry and clay.

Lewie District.

THE PITTSBURGH MINE.—*Silver State*, June 17: The Pittsburgh mine, in Lewis district, which was reported in these columns last week to have been sold for \$300,000, has been disposed of in London for \$30,000, which is \$270,000 more than the price first stated. The sale was made by J. A. Blossom, of Battle Mountain, through whose enterprise the mine was developed. The Pittsburgh is a gold-bearing mine, and it has produced considerable bullion.

Mt. Rose District.

OUTLOOK.—*Silver State*, June 17: The outlook in the Paradise and Wild Goose mines for some time was not as favorable as was desirable, but a rich vein of ore has been struck in the shaft running from tunnel No. 4 of the Paradise mine, so that in place of reducing the force, as was expected, Superintendent McCurdy is increasing the number so that the pay-roll shows over 100 names. The Cliff mine is an extension of the Paradise, owned by W. B. Toddhunter & Co., and superintended by Nick Frayer. A force of men has gone to Spring City, to commence excavations for the foundation of the engine-house and hoisting works soon to be erected on the Cliff mine. The timbers for the construction of the works are already on the road to the mine, and should there be no drawbacks we may expect a mining boom in Spring City and Paradise that will outstrip the boom of 8 years ago.

Tuscarora District.

THE FOUND TREASURE.—*Virginia Enterprise*, June 19: In many places on the Pacific Coast there are "hidden treasure" mines, but Tuscarora has the first "found treasure" mine of which we have heard. It is already an ore-producer, and promises soon to take its place among the leading mines of Nevada. It is situated to the northwest of the Nevada Queen and May Queen. It is on the extension of the main lode that runs through the Navajo, North Belle Isle and Nevada Queen. The continua-

tion of this vein has always been looked for to the northward, but it seems that it curves to the north-west. The vein was first found in a shaft sunk on the north line of the May Queen, and it is now conceded that it is the main vein that runs through the Navajo and other leading mines. The new mine known as the Commonwealth adjoins it on the east. The Found Treasure has recently been purchased by General R. M. Clarke and H. M. Yerington, of Carson; Thomas Brown, Cashier of the Bank of California; A. J. Ralston, of San Francisco, and W. H. Ennor and F. N. Drake, of Tuscarora. The two Tuscarora men named have a good opportunity of knowing what the mine is, as they hold an unexpired lease of it, but the company recently incorporated will soon come into possession. The mine is already a bullion-producer and has been profitably worked by Messrs. Ennor and Drake. Only the other day these parties shipped a large lot of ore to the Reno Reduction Works. It is the intention of the newly incorporated company to open the mine in a systematic manner, and soon large amounts of ore will be taken from it.

ARIZONA.

HASSAYAMPA.—Prescott *Courier*, June 18: Good miners of Hassayampa district think well of the Senator and U. P., two gold mines which have been sufficiently tested to satisfy them that they are rich enough to pay. The U. P. belongs to Messrs. La Bertue, Pace and others. Its rock has paid well in assays. The Senator belongs to Hugo Richards and Geo. W. Bowers. These ledges are in the midst of many others, and a tunnel would tap them low down. Timber is abundant in the district. Owners of the Boggs' mine, near Mayer, Big Bug district, are sinking with every prospect of opening a fine property. Geo. D. Ridenour and his partner will shortly make another shipment of 220-ounce silver ore. Jennings has just taken a lot of ore sacks to his mine, seven miles south of Prescott. Mr. Dillon, who owns mines in the Cataract creek, is visiting Prescott. The last shipment of ore paid pretty well. Mr. Jones is making foundations for a new mill; he is going to build on Groom creek. Moore and partner were recently offered \$40,000 in cash for their mine in Walker district. They preferred to keep and work it. We have great faith in certain mines of Peck district. The Peck, in a few years, yielded more than a million dollars' worth of silver, and those who worked in it before the water flooded the lower levels are confident that it has yet in store thousands of tons of rich ore. The Warrior, Prince, Alta and other ledges near Peck, have yielded good ore, and will yet be worked by people who will make money out of them.

THE GLOBE COPPER MINE.—Arizona *Silver Belt*, June 17: The present condition of the Globe mine is such that it would supply one furnace for the remainder of the present year with fine ore. During the last six months the improvements made in opening new ore bodies were of great extent and, as we understand, all paid out of the copper production, which, during the last nine months, was limited to 135 days for one furnace, so that fully 4½ months were spent for development. Nearly every level, from the first to the fifth, shows new ore discoveries, some right in the midst of old workings. The most important part, however, is the outlook in the fifth level, where very large ore bodies are traversed by a drift, yet unexplored as to its exact extent. The workings, as left now, are all in excellent shape, clean and well timbered. Under these circumstances, the policy of the owners to let the mine fill with water, and take chances of deterioration, is certainly much to be regretted.

COLORADO.

GUNNISON.—Elk Mountain *Pilot*, June 18: Gunnison county has a greater variety of minerals than any other section of the country. Our mountains are not only rich with gold and silver, but lead, copper, coal, lime, fire-clay, marble, etc. With all of these base metals and fluxes there is no excuse for shipping a pound of ore out of the county. The Illinois tunnel, near Irwin, is now 635 feet long, and Mr. Putnam reports that the last four feet were driven through a porphyry wall, very similar in character to the walls of the Great Eastern vein. The old Elko smelter is to be started up and run as a sampling works to purchase ores for the Tomitchi valley smelter. Dr. Evans is sacking ore from his Antelope mine in Redwell basin. The Bullion King mine is increasing its force, and will probably work an additional force of 25 men. Mining circles in Gunnison last Saturday were at fever heat. An important sale was made in which S. G. Gill, Walter Hamlin, Fred Leonard and Ira Brown figured as the purchasers of the Little May and Lost Condit mines, in the White Pine district. These gentlemen are all well-known citizens of Gunnison, who already owned the Mazonia mine, on the same vein. The mines purchased have produced over \$80,000 since they were discovered, and now have probably \$50,000 in sight.

IDAHO.

PONY ITEMS.—Coeur d'Alene *Record*, June 12: There are 26 quartz claims on the main gulch in the Pony district. On the west side are 13 full claims and 900 feet of the Honduras, and on the east side 12 claims and 600 feet of the Honduras. The following are the names of the locations on the east side in regular order, beginning near the head of the gulch: Windmill, Rattler, Homestake Honduras, Mammoth, Jim Blaine, Jay Eye See, North Star, Columbia, Leader, Occidental and Isadore. On the opposite side are the Jennie Winston, St. Patrick, Honduras, Legal Tender, Fay Templeton, Lizzie B. L. Fraction, Corianna and McCloud. Hauck Bros. and Jack Thompson are doing some good work on the Legal Tender. They have a fine vein of rich ore between well-defined walls. The hanging-wall is slate and the foot-wall quartzite. They are running on the vein on the Fay Templeton side of Democrat gulch, and are in about 35 feet. Van Dorn Bros. will soon begin work on the Comstock, on the divide between Pony and Potosi gulches. They have a four-foot fissure vein of rich ore. The Mammoth bids fair to prove as a good property as its neighbor across the creek. Tom Smith is doing development work on the Windmill for an interest. It is owned by Fred Krause, who also owns the Honduras, on which he is now working, and which is considered one of the

best properties in the gulch. Contracts have been let to run tunnels on the Lizzie B. L. Fraction and the Black Bass. The new town, or rather town site, extends as far up as the Templeton millsite. A good many lots have been staked, and several cabins are in course of construction. As soon as the building of the Fay Templeton quartz-mill is assured, the place will experience quite a boom, and Templeton will spring into being as one of the bona fide towns of Coeur d'Alene.

SUMMIT FLAT.—World, June 17: Thos. Barry, Sr., was up through Summit Flat district last Sunday, and as far as Willson's mine, the Mammoth, which is turning out fine ore. The mill has been running over two weeks. Fourteen men are employed at the Elkhorn, in mine and mill. This mine is turning out ore from the lower tunnel that will run high. The mill has been crushing about two weeks. A raise will soon be started from the lower tunnel for the purpose of opening up the main pay chute of the mine. The vein that is now being worked was tapped in running for the Elkhorn, and is either a separate vein or a spur of the Elkhorn. Men are at work about a mile below the Elkhorn, on what is known as the Ross claim. They are cleaning out the tunnel, preparatory to taking out ore. A company of men from Centerville are working a ledge 500 or 600 yards below the Ross mine. Two lots of ore from this mine were crushed in the Elkhorn mill last year. One lot went \$15 and the other \$40 per ton.

ELKHORN.—John Cowan, who was up at the Elkhorn mine a short time ago, says the mill, a five-stamp, is crushing 12 tons of first-class ore every 24 hours. The lower tunnel is 1230 feet in length, and is within about 90 feet of the Elkhorn ledge. The vein that is now turning out rich ore is something over 300 feet from the mouth of the tunnel. Mr. Turner has a sawmill near the quartz-mill, for sawing timbers for the mine. The quartz-mill will run until about the 1st of next month, when a cleanup will be made, and the mill will then be moved down on Elk creek, at the mouth of the long tunnel.

GOLD ROCK.—Idaho *World*, June 14: A. B. Morrell has struck good rock in his mine in Lewis' gulch. A crosscut was run from the lower tunnel and tapped a vein from two and a half to three feet thick, all of which is good milling ore. This is the best showing the mine has ever made. It was tapped about two weeks ago, and time and development, of course, will have to determine the extent of it. One man, in 12 days, took out 25 tons.

MONTANA.

THE NEW WATER SYSTEM.—Butte *Miner*, June 15: Success has attended the operation of sinking the new shaft in Silver Bow creek, opposite the Blue Bird mill, for a permanent supply of clear water for milling operations. It is expected that the water from this source will benefit the amalgamation. The water used at present is from the surface of the creek, being muddy, impure, probably containing tailings from the other mills of Butte. The clear water is obtained by sinking a shaft from the surface near the edge of the creek and drifting from it in the bedrock. The water obtained is clear as crystal. The drift will be continued until 500 gallons per minute is obtained, being the requirements of the mill. This is a much larger supply than the other mills in Butte are using. The water from the new shaft will be forced to the mill by a system not heretofore used in Butte. It is that of a double-gear pump, operated by wire rope transmission, a distance of over 600 feet. It will be driven by the main mill engine.

MADISON COUNTY MINES.—I have recently investigated the regions of the Madison goldfields. In the New Discovery the developments are rich, as is shown by assays now being made by different offices. From this and other rock shown, the future of this camp is assured. It is rich in free gold. The Paymaster, owned by Long, Ewing & Co., has been sunk 30 feet on a vein of gold-bearing quartz. The vein opened up at a width of two inches at an angle of 45 degrees. At a depth of 30 feet the vein was developed to an extent of five feet in width. The ore goes about \$10 in silver, but gold predominates to the extent of \$75 per ton. The Ida Clayton, owned by Noyes, Ewing & Co., lies next to the property owned by A. J. Davis. The battery assay from this mine shows \$12.24 in silver and \$204.80 in gold. A force of six men will be put on to the mine immediately and progressive development will take place very soon. The Amazon, located by William Noyes & Co., has only been developed to the extent of prospects, but promises to prove the richest in the camp, from the fact that the ore extracted carries free gold in abundance.

THE HIGH ORE.—The machinery at present in use at the High Ore is occasioning a good deal of trouble. The first break-down experienced was a little over a week ago, since when they have broken down twice. They shut down for the fourth time at three o'clock on Thursday from the same cause, and it is said will continue so for two months in order to put in new machinery that will avoid any future trouble. The mine is now down 600 feet, which is much too deep for their present plant; they are going still deeper. The Humboldt, that was lying idle for some time, resumed operations with a small force.

THE BLUE BIRD.—The Blue Bird Company employs about 200 men. An extra force is now employed at the mill. The same plan of development is being carried on with success and encouragement, 100 tons of ore being hoisted per day. Part of the new machinery is already in operation. The work is all completed but housing the batteries.

NEW MEXICO.

MILL.—Socorro *Bullion*, June 11: Messrs. Hermann, Gates, Logan & Graham are building a stamp-mill in the Mogollons. This will make the fourth mill in that locality. The Peacock mill will be ready to commence business in a short time. About 1500 cords of wood have been contracted for and a long pipe for conducting water to the mill is now being put in place. Burns & Co., Clearmont, Mogollon district, have recently opened up a fine body of ore, the character of which is identical with that found in the Cooney mine. All the mine needs to become a rich producer is facilities for transportation. Judge Dougherty, of this city, made an important silver strike in the Socorro last week. The time is arriving when this range will come to

the front. The resumption of work on the Merril will be the signal for the extensive prospecting of this neglected silver-bearing mountain. A sample of ore from the Big Tree mine, Hermosa, assayed by the Graphic Smelting Works, returned 506 ozs. silver and a half oz. in gold. This mine is being worked by H. B. Ferguson and Kean St. Charles, and promises to be one of the solid producers of that growing region.

OREGON.

GOLD BARS.—Oregonian, June 17: Eight small gold bars, worth about \$2000, were displayed in the window of Gove's jewelry store yesterday. They came from Charles Cornelius's Gold Hill mine, and are the first gold bars displayed here for some time.

FROM CINNABAR.—Jacksonville *Times*, June 17: David Cronmiller and E. D. Brown, a mining expert, returned from the old cinabar mines in the Siskiyou mountains yesterday, where they have been for the past two weeks. They relocated the claims that were opened several years ago and will do considerable work on them again this summer. They also report good weather in that section and grass growing finely, though everything is quite late this year.

STEAMBOAT ITEMS.—Miners are cleaning up. John O'Brien has most of the old dump worked off which is paying well. Mennis Caldwell is making a good cleanup, and will mine Bear gulch next winter. A. H. Sargent will resume work on Brush creek mines. Prickett & Co. are putting up several hundred feet of hydraulic pipe and will mine on a large scale next season. B. S. Baker of this place has invented a new device for saving gold which he claims will excel any yet made.

UTAH.

REVIEW.—Salt Lake *Tribune*, June 18: The week has been quiet, but the movement of ores has been large. The roads are being opened into the hills, and the ore taken out in the winter comes down freely. The receipts in this city for the week ending June 15th, inclusive, were \$79,883.11 in aggregate, of which \$60,865.22 was bullion and \$19,017.89 was ore. For the previous week the receipts were \$74,120.28 in bullion and \$132,182.87 in ore, a total of \$312,182.87. The product of the Ontario for the present month to date is, bullion, 40,467.27 fine ounces; ore sales for the week, \$73,397.49. The Daily output for the week was, bullion, 8821.83 fine ounces. All is going well with this mine, and the new hoisting machinery is getting pretty well in place. The Horn Silver at Frisco continues to ship ore at irregular intervals and in varying quantities. The public is not in the confidence of this concern, a statement which may also be taken in reverse, though we wish for the sake of the public, as well as of themselves, that the managers would make a frank statement of the condition of their affairs. Base bullion receipts of the week were to the value of \$15,400; gold bars, \$8000; selected lead, \$7343.89. The Hanauer smelter produced for the week, \$18,800 in bullion; the Germania, seven cars, \$11,321.33. Ore receipts in this city for the week were \$35,800 by Wells, Fargo & Co.; \$67,950 by McCormick & Co.; \$15,267.89 by T. R. Jones & Co.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court Department to, San Francisco:

PACIFIC EXPANDED METAL CO., June 17. The object is to manufacture, buy and sell slotted metallic screening as per certain patent rights. Capital stock, \$100,000. Directors—Henry L. Tatum, J. J. Bowen, S. P. Smiley, A. M. Williams and S. H. Melvin.

RAE ELECTRIC SYSTEM CO., June 20. Capital stock, \$1,000,000. Object, to construct electrical appliances to be used in the Rae system of working ores and tailings. Directors—Wm. Alvord, Geo. C. Perkins, A. P. Brayton, Julio H. Rae and Julius Jacobs.

PACIFIC COAST SUGAR CO., June 20. Capital stock, \$1,000,000. Directors—John L. Howard, E. H. Dyer, Henry T. Scott, Harvey W. Snow, Oscar T. Sewell, R. M. Anthony and W. H. Pettis.

ALTAMONT STONE QUARRY CO., June 20. Capital stock, \$500,000. Directors—G. Raich, G. R. Fletcher, H. H. Bodwell, A. K. Green and D. Gutman.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 262 Market St., S. F.

FOR WEEK ENDING JUNE 14, 1887.

364,933.—WINDMILL—F. Altman, San Jose, Cal.
364,638.—NAVIGABLE VESSELS—W. Forward, Shingletown, Cal.
364,709.—CABLE GRIP—W. Danham, Igo, Cal.
364,839.—PORTABLE STEAM BOILER—Mitchell & Fischer, Oakland, Cal.
364,727.—LOCK AND LATCH—E. Nyswonger, Hanford, Cal.
364,676.—CASK—E. Skakat, Los Angeles, Cal.
364,874.—CAR COUPLING—D. L. Vess, Spokane Falls, W. T.
364,693.—TIMBER ROLL—R. M. Webb, S. F.
364,877.—SAW SWAGE—Wheeler & Newhouse, Corvallis, Ogn.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CABLE GRIP.—Warren Danham, Igo, Shasta county. No. 364,709. Dated June 14, 1887. This grip for cable cars consists in the novel roller-jaws by which the cable is gripped or released, a center or supplementary pair of jaws for gripping the cable in case of necessity, mechanism for operating the jaws, and certain details of construction. The cable is gripped by the side faces of the rollers, so that, while affording play enough to avoid the sudden start which is the result of a too sudden grip, the jaws clamp the cable tightly enough to prevent it slipping through and thus causing abrasion in stranding.

PORTABLE STEAM BOILERS.—J. R. Mitchell and F. H. Fischer, Oakland. No. 364,839. Dated June 14, 1887. This improvement is based especially on a patent previously granted to same inventors. In the former construction, they showed water-legs carried straight up, so that the outer walls meet the boiler-shell in a line nearly or quite tangent to it, and this forms a sharp angular space within which it is difficult for water to circulate, and where it would become filled with scale in a short time and entirely impede the water circulation. In the present invention, which is especially applicable to portable steam boilers for burning straw or other light material, although not limited to these, they have extended the water-legs above or up to nearly the water-line, and in the arc of a circle, the center of which coincides with the center of the boiler-shell, this arc extending longitudinally the whole length of the water-legs.

Mining Share Market.

There is very little animation in the stock market at present, prices showing only small changes. Up on the Comstock, according to the *Enterprise*, the situation is better than for years, and is constantly improving as work progresses. It has been years since so much ore has been in sight in leading mines along the lode. All this will presently be brought to the surface, as it is only awaiting milling facilities. In the water-mills shortly to be started up a new departure is being taken, and it is probable that other mills than those on which work is at present being done will be erected at no distant day.

As for the fire in the bulkhead section of the Consolidated California and Virginia mine, it is undoubtedly extinguished. There is every indication that the carbonic acid gas injected into the mine has done its work. In a few days the bulkheads will be opened and a draft of atmospheric air allowed to pass through the inclosed section to cool off the heated rock. It will not be long before work will be resumed in this long-abandoned part of the mine. That there is in it much good ore is a fact that is well known.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Richmond Con., June 17, \$14,039; Gila, 19, \$7000; Candalaria, 18, \$10,000; Lexington, 19, \$28,896; Alce, 14, \$34,436; Moulton, 15, \$16,730; Bluebird, 14, \$25,856; Con. California and Virginia, 19, \$98,617; Margaret Ann, 16, \$4256; Silver Bow, 16, \$31,291; Standard, 18, \$11,980; Georene, 18, \$5000; Chicago, 20, \$3758; Hanauer, 15, \$2900; Crescent, 15, \$7800; Germania, 15, \$3130; Hanauer, 14, \$2790; Germania, 14, \$1561; Hanau, 16, \$5400; 17, \$2800; Germania, 17, \$5374. The banks of Salt Lake City report the receipt for the week ending June 15th, inclusive, of \$119,017.89 in ore and \$60,865.22 in bullion, a total of \$179,883.11.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1883; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

RANKIN, BRAYTON & CO.,
...BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE HAZELTON BOILER.

A NEW AND RADICAL DEPARTURE IN

STEAM GENERATOR.

DESTINED TO REVOLUTIONIZE ALL FORMER METHODS. A SAVING IN FUEL
OF AT LEAST 25 PER CENT GUARANTEED OVER ANY
OTHER STYLE OF BOILER.

SEND FOR CIRCULARS.

PACIFIC IRON WORKS, San Francisco, Cal.

COMPRESSED AIR and WATER POWER MACHINERY.

RIX & FIRTH, 18 and 20 Fremont St., San Francisco.

NATIONAL AIR COMPRESSORS.
SINGLE OR DUPLEX, STEAM OR BELT POWER.
62 Sold on the Pacific Coast.

KNIGHT'S WATER WHEEL,

—FOR—

MILLS, PUMPING AND HOISTING.
Over 300 in use. All estimates guaranteed. Send for Circular.

MINERS' HORSE WHIM.

All wrought iron. No gears, no breakage. One horse will easily handle rock or water to a depth of 350 feet, giving entire satisfaction to the prospector. Price, complete, \$200. 150 sold on this Coast.

NATIONAL ROCK DRILL.
200 Sold on this Coast. Has less repairs than any other Drill.

Centrifugal Roller Quartz Mill.

F. A. HUNTINGTON,

MANUFACTURER OF

**Centrifugal Roller Quartz Mills,
CONCENTRATORS AND ORE CRUSHERS.**

Mining Machinery of Every Description,

Steam Engines and Shingle Machines.

SEND FOR CIRCULAR.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG
OILS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco.

We would call the attention of Assayers, Chemists,
Mining Companies, Milling Companies, Prospectors, etc.,
to our full stock of Balances, Furnaces, Muffles, Crucibles,
Scorifiers, etc., including, also, a full stock of
Chemicals.

Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast, we feel
confident from our experience we can well suit the demand
for these goods, both as to quality and price. Our
New Illustrated Catalogue, with prices, will be sent on
application.

Our Gold and Silver Tables, showing the value per
ounce Troy at different degrees of fineness, and valuable
tables for computation of assays in grains and grammes,
will be sent free upon application. Agents for the Patent
Plumbago Crucible Co., London, England. Also for E.
G. DENNISTON'S Silver Plated Amalgam Plates. The
plates of this well-known manufacturer are thoroughly
reliable, and full weight of Silver guaranteed. Orders
taken at his lowest prices.

NOTICE.—My Silver-Plated Plates are well known and used everywhere. They have proved superior to all others in durability and weight of Silver.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Olobe Cases, free of cost,
by applying to the manufacturers.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by
the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion
as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-
heated steam currents employed, through which every minute particle of ore must pass, causes them to become very
hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight
and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER
and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

PNEUMATIC PULVERIZER COMPANY,

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied. At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet. All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco. Certificates as to performance of the Mills, and any information required, furnished on application.

THE FRISBEE-LUCOP MILL CO.,

Office, 145 Broadway, cor. Liberty St., NEW YORK.

PATENT

LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation.

The most perfect appliances for people engaged in Smelting, Dry Crushing, Gunpowder Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor. In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to JOHN TAYLOR & CO., Sole Agents, 114 to 118 Pine St., San Francisco.

Send for Descriptive Circulars containing Testimonials of well-known parties who are at present using them.
